- *any impurity apart from the peak due to tartaric acid*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- *total*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1 per cent),
- *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (b) (0.02 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) R.

Loss on drying (2.2.32): maximum 1.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.280 g in 40 ml of *anhydrous acetic acid* R. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 37.04 mg of $C_{16}H_{22}N_2O_6S$.

STORAGE

Protected from light.

IMPURITIES

- A. 1-methyl-2-[(*E*)-2-(4-methylthiophen-2-yl)ethenyl]-1,4,5,6-tetrahydropyrimidine,

- B. 1-methyl-2-[(*Z*)-2-(3-methylthiophen-2-yl)ethenyl]-1,4,5,6-tetrahydropyrimidine,

- C. 1,2-dimethyl-1,4,5,6-tetrahydropyrimidine,

and enantiomer

- D. (1*R*)-2-(1-methyl-1,4,5,6-tetrahydropyrimidin-2-yl)-1-(3-methylthiophen-2-yl)ethanol,

- E. 3-methylthiophene-2-carbaldehyde.

01/2005:0097

MORPHINE HYDROCHLORIDE**Morphini hydrochloridum**

$C_{17}H_{20}ClNO_3 \cdot 3H_2O$

M_r 375.8

DEFINITION

Morphine hydrochloride contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of 7,8-didehydro-4,5 α -epoxy-17-methylmorphinan-3,6 α -diol hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder or colourless, silky needles or cubical masses, efflorescent in a dry atmosphere, soluble in water and in glycerol, slightly soluble in alcohol.

IDENTIFICATION

- Dissolve 10 mg in *water* R and dilute to 100.0 ml with the same solvent. Examined between 250 nm and 350 nm (2.2.25), the solution shows a single absorption maximum, at 285 nm. The specific absorbance at the maximum is about 41.
- Dissolve 10 mg in 0.1 M *sodium hydroxide* and dilute to 100.0 ml with the same solvent. Examined between 265 nm and 350 nm (2.2.25), the solution shows a single absorption maximum, at 298 nm. The specific absorbance at the maximum is about 70.
- To about 1 mg of powdered substance in a porcelain dish add 0.5 ml of *sulphuric acid-formaldehyde reagent* R. A purple colour develops and becomes violet.
- Dissolve about 5 mg in 5 ml of *water* R and add 0.15 ml of a freshly prepared 10 g/l solution of *potassium ferricyanide* R and 0.05 ml of *ferric chloride solution* R1. A blue colour is produced immediately.
- Dissolve about 5 mg in 5 ml of *water* R and add 1 ml of *dilute hydrogen peroxide solution* R, 1 ml of *dilute ammonia* R1 and 0.05 ml of a 40 g/l solution of *copper sulphate* R. A red colour develops.
- It gives reaction (a) of chlorides (2.3.1).
- It gives the reaction of alkaloids (2.3.1).

TESTS

Solution S. Dissolve 0.50 g in *water* R and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y_6 or BY_6 (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.05 ml of *methyl red solution R*. Not more than 0.2 ml of 0.02 M sodium hydroxide or 0.02 M hydrochloric acid is required to change the colour of the indicator.

Specific optical rotation (2.2.7). –110 to –115, determined on solution S and calculated with reference to the dried substance.

Related substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel G plate R*.

Test solution. Dissolve 0.10 g of the substance to be examined in a mixture of equal volumes of *alcohol R* and *water R* and dilute to 10 ml with the same mixture of solvents.

Reference solution. Dissolve 50 mg of *codeine phosphate R* in 5 ml of the test solution. Dilute 0.1 ml of the solution to 10 ml with a mixture of equal volumes of *alcohol R* and *water R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a freshly prepared mixture of 2.5 volumes of *concentrated ammonia R*, 32.5 volumes of *acetone R*, 24.5 volumes of *ethanol R*, 10.5 volumes of *water R* and 35 volumes of *toluene R*, prepared in the order given. Dry the plate in a current of air. Spray with *potassium iodobismuthate solution R* and dry for 15 min in a current of air. Spray with *dilute hydrogen peroxide solution R*. Any spot corresponding to codeine in the chromatogram obtained with the test solution is not more intense than the corresponding spot in the chromatogram obtained with the reference solution (1 per cent); any spot apart from the principal spot and the spot corresponding to codeine, is not more intense than the spot corresponding to morphine in the chromatogram obtained with the reference solution (1 per cent). The test is not valid unless the chromatogram obtained with the reference solution shows two clearly separated spots.

Meconate. To 10 ml of solution S add 1 ml of *hydrochloric acid R* and 0.1 ml of *ferric chloride solution R1*. The absorbance (2.2.25) measured at 480 nm is not greater than 0.05 (0.2 per cent). Use as the compensation liquid a blank solution prepared at the same time and in the same manner using 10 ml of *water R*.

Loss on drying (2.2.32). 12.0 per cent to 15.0 per cent, determined on 0.500 g by drying in an oven at 130 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on the residue from the test for loss on drying.

ASSAY

Dissolve 0.350 g, heating if necessary, in 30 ml of *anhydrous acetic acid R*. Cool and add 6 ml of *mercuric acetate solution R*. Titrate with 0.1 M *perchloric acid*, using 0.1 ml of *crystal violet solution R* as indicator.

1 ml of 0.1 M *perchloric acid* is equivalent to 32.18 mg of C₁₇H₂₀ClNO₃.

STORAGE

Store protected from light.

IMPURITIES

A. codeine,

B. 2,2'-bimorphine (pseudomorphine),

C. morphine *N*-oxide,

D. 3-hydroxy-4-oxo-4*H*-pyran-2,6-dicarboxylic acid (meconic acid).

01/2005:1244

MORPHINE SULPHATE

Morphini sulfas

C₃₄H₄₀N₂O₁₀S·5H₂O

M_r 759

DEFINITION

Morphine sulphate contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of di(7,8-didehydro-4,5α-epoxy-17-methylmorphinan-3,6α-diol) sulphate, calculated with reference to the anhydrous, ethanol-free substance.

CHARACTERS

A white or almost white, crystalline powder, soluble in water, very slightly soluble in alcohol, practically insoluble in toluene.

IDENTIFICATION

First identification: A, E.

Second identification: B, C, D, E.

A. Examine by infrared absorption spectrophotometry (2.2.24), after drying the substance to be examined at 145 °C for 1 h, comparing with the *Ph. Eur. reference spectrum of morphine sulphate*.

B. Dissolve 0.100 g in *water R* and dilute to 100.0 ml with the same solvent (solution A). Dilute 10.0 ml to 100.0 ml with *water R*. Examined between 250 nm and 300 nm

(2.2.25), the solution shows a single absorption maximum, at 285 nm. The specific absorbance is in the range 37 to 43. Dilute 10.0 ml of solution A to 100.0 ml with 0.1 M sodium hydroxide. Examined between 250 nm and 350 nm (2.2.25), the solution shows a single absorption maximum, at 298 nm. The specific absorbance is in the range 64 to 72.

C. To about 1 mg of powdered substance in a porcelain dish add 0.5 ml of *sulphuric acid-formaldehyde reagent R*. A purple colour develops and becomes violet.

D. It gives the reaction of alkaloids (2.3.1).

E. It gives the reactions of sulphates (2.3.1).

TESTS

Solution S. Dissolve 0.500 g in *water R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₆ or BY₅ (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.05 ml of *methyl red solution R*. Not more than 0.2 ml of 0.02 M sodium hydroxide or 0.02 M hydrochloric acid is required to change the colour of the indicator.

Specific optical rotation (2.2.7): –107 to –110, determined on solution S and calculated with reference to the anhydrous, ethanol-free substance.

Related substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel G plate R*.

Test solution. Dissolve 0.20 g of the substance to be examined in a mixture of equal volumes of *alcohol R* and *water R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dissolve 25 mg of *codeine phosphate R* in 5 ml of the test solution. Dilute 0.2 ml of the solution to 10 ml with a mixture of equal volumes of *alcohol R* and *water R*.

Reference solution (b). Dilute 0.1 ml of the test solution to 20 ml with a mixture of equal volumes of *alcohol R* and *water R*.

Reference solution (c). Dilute 2.0 ml of reference solution (b) to 5.0 ml with a mixture of equal volumes of *alcohol R* and *water R*.

Reference solution (d). Dilute 2.0 ml of reference solution (b) to 10.0 ml with a mixture of equal volumes of *alcohol R* and *water R*.

Apply to the plate 10 µl of each solution. Develop over a path of 10 cm using a freshly prepared mixture of 2.5 volumes of *concentrated ammonia R*, 32.5 volumes of *acetone R*, 24.5 volumes of *ethanol R*, 10.5 volumes of *water R* and 35 volumes of *toluene R*, prepared in the order given. Dry the plate in a current of air. Spray with *potassium iodobismuthate solution R* and dry for 15 min in a current of air. Spray with *dilute hydrogen peroxide solution R*. Any spot corresponding to impurity A in the chromatogram

obtained with the test solution is not more intense than the corresponding spot in the chromatogram obtained with reference solution (a) (0.5 per cent). Any spot in the chromatogram obtained with the test solution, apart from the principal spot and any spot corresponding to impurity A is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent) and not more than two such spots are more intense than the spot in the chromatogram obtained with reference solution (c) (0.2 per cent). The test is not valid unless the chromatogram obtained with reference solution (a) shows two such clearly separated spots and the spot in the chromatogram obtained with reference solution (d) is clearly visible.

Ethanol (2.4.24). Not more than 0.5 per cent.

Iron (2.4.9). Dissolve the residue from the test for sulphated ash in *water R* and dilute to 10.0 ml with the same solvent. The solution complies with the limit test for iron (5 ppm).

Water (2.5.12): 10.4 per cent to 13.4 per cent, determined on 0.200 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 2.0 g.

ASSAY

Dissolve 0.500 g in 120 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 66.88 mg of C₃₄H₄₀N₂O₁₀S.

STORAGE

Store protected from light.

IMPURITIES

A. codeine,

B. 2,2'-bimorphine (pseudomorphine),

C. morphine N-oxide.

01/2005:1833

MOTHERWORT**Leonuri cardiaca herba****DEFINITION**

Whole or cut, dried flowering aerial parts of *Leonurus cardiaca* L.

Content: minimum 0.2 per cent of flavonoids, expressed as hyperoside ($C_{21}H_{20}O_{12}$; M_r 464.4) (dried drug).

CHARACTERS

Macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

A. The stem pieces are hairy, longitudinally striated, quadrangular, hollow, and up to about 10 mm wide; they bear opposite and decussate, petiolate leaves and, in the axils of the upper leaves, about 6 to 12 small flowers, arranged in sessile whorls forming a long leafy spike. The lower leaves are ovate-orbicular, palmately 3 to 5-lobed, rarely 7-lobed, the lobes irregularly dentate. The upper leaves are entire or slightly trifid, lanceolate with a serrate margin and cuneate at the base. The upper surface of the leaves is green with scattered hairs, the lower surface is paler green, densely pubescent and shows a prominent palmate and reticulate venation. The flowers have a funnel-shaped calyx, 3 mm to 5 mm long with 5 stiff, recurved teeth; the corolla is 2-lipped, the upper lip pink and pubescent on the outer surface, the lower lip white with purplish spots; stamens 4, densely pubescent.

B. Reduce to a powder (355). The powder is green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the leaf lamina with a one-layered palisade mesophyll reaching almost to the centre and a loosely arranged spongy parenchyma; fragments of leaf epidermis; upper epidermal cells with straight anticlinal walls and a striated cuticle; lower epidermal cells with sinuous anticlinal walls; stomata of the diacytic type (2.8.3) more numerous on the lower surface; glandular trichomes with a short unicellular stalk and a globular head composed of 8, sometimes up to 16 cells or with a unicellular head; covering trichomes conical, uniseriate, up to about 300 µm long, occasionally up to 1500 µm, composed of from 2 to 8 cells with slight swellings at the junctions and a warty or striated cuticle; fragments of the calyx containing small, cluster crystals of calcium oxalate; spherical pollen grains, about 25 µm to 30 µm in diameter, with 3 pores and 3 furrows and a smooth exine; thick-walled, lignified fibres and spirally and annularly thickened vessels from the stem; occasional brown fragments of pericarp with single crystals of calcium oxalate.

C. Thin-layer chromatography (2.2.27).

Test solution. To 0.5 g of the powdered drug (355) add 5 ml of *methanol R*. Heat in a water-bath at 65 °C for 5 min with shaking. Cool and filter.

Reference solution. Dissolve 5 mg of *naphthol yellow S R* and 2.0 mg of *catalpol R* in 5.0 ml of *methanol R*.

Plate: TLC silica gel plate *R*.

Mobile phase: *glacial acetic acid R*, *water R*, *ethyl acetate R* (20:20:60 V/V/V).

Application: 20 µl as bands.

Development: over a path of 10 cm.

Drying: in air.

Detection: spray with *dimethylaminobenzaldehyde solution R2*, using about 5 ml for a plate 200 mm square; heat at 100-105 °C for 10 min until the spots appear; examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, further weak greyish-blue zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A wide white zone
	A greyish-blue zone (iridoid)
Naphthol yellow S: an intense yellow zone	1 or 2 greyish-blue zones (iridoid)
Catalpol: a greyish-blue zone	
Reference solution	Test solution

TESTS

Foreign matter (2.8.2): maximum 2 per cent of brown or yellow leaves and maximum 2 per cent of other foreign matter.

Loss on drying (2.2.32): maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100-105 °C for 2 h.

Total ash (2.4.16): maximum 12.0 per cent.

ASSAY

Stock solution. In a 100 ml round-bottomed flask, place 1.00 g of the powdered drug (355), add 1 ml of a 5 g/l solution of *hexamethylenetetramine R*, 20 ml of *acetone R* and 2 ml of *hydrochloric acid R1*. Boil the mixture under a reflux condenser for 30 min. Filter the liquid through a plug of absorbent cotton into a flask. Add the absorbent cotton to the residue in the round-bottomed flask and extract with 2 quantities, each of 20 ml, of *acetone R*, each time boiling under a reflux condenser for 10 min. Allow to cool, filter each extract through the plug of absorbent cotton into the flask. After cooling, filter the combined acetone extracts through a paper filter into a volumetric flask, dilute to 100.0 ml with *acetone R* by rinsing the flask and the paper filter. Introduce 20.0 ml of the solution into a separating funnel, add 20 ml of *water R* and shake the mixture with 1 quantity of 15 ml and then with 3 quantities, each of 10 ml, of *ethyl acetate R*. Combine the ethyl acetate extracts in a separating funnel, wash with 2 quantities, each of 50 ml, of *water R*, and filter the extracts over 10 g of *anhydrous sodium sulphate R* into a volumetric flask and dilute to 50.0 ml with *ethyl acetate R*.

Test solution. To 10.0 ml of the stock solution add 1 ml of *aluminium chloride reagent R* and dilute to 25.0 ml with a 5 per cent V/V solution of *glacial acetic acid R* in *methanol R*.

Compensation liquid. Dilute 10.0 ml of the stock solution to 25.0 ml with a 5 per cent V/V solution of *glacial acetic acid R* in *methanol R*.

Measure the absorbance (2.2.25) of the test solution after 30 min, by comparison with the compensation liquid at 425 nm. Calculate the percentage content of flavonoids, calculated as hyperoside, from the expression:

$$\frac{A \times 1.25}{m}$$

i.e. taking the specific absorbance of hyperoside to be 500.

A = absorbance at 425 nm,

m = mass of the substance to be examined, in grams.

01/2005:1758

MOXONIDINE

Moxonidinum

$C_9H_{12}ClN_5O$

M_r 241.7

DEFINITION

4-Chloro-*N*-(imidazolidin-2-ylidene)-6-methoxy-2-methylpyrimidin-5-amine.

Content: 97.5 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: very slightly soluble in water, sparingly soluble in methanol, slightly soluble in methylene chloride, very slightly soluble in acetonitrile.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: moxonidine CRS.

TESTS

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in a mixture of equal volumes of *methanol R* and *water R* and dilute to 100.0 ml with the same mixture of solvents.

Reference solution (a). Dissolve 10.0 mg of *moxonidine CRS* in a mixture of equal volumes of *methanol R* and *water R* and dilute to 10.0 ml with the same mixture of solvents.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with a mixture of equal volumes of *methanol R* and *water R*. Dilute 2.0 ml of this solution to 20.0 ml with a mixture of equal volumes of *methanol R* and *water R*.

Reference solution (c). Dissolve 5.0 mg of *moxonidine impurity A CRS* in a mixture of equal volumes of *methanol R* and *water R* and dilute to 100.0 ml with the same mixture of solvents.

Reference solution (d). Dilute 6.0 ml of reference solution (c) to 100.0 ml with a mixture of equal volumes of *methanol R* and *water R*.

Reference solution (e). Dilute 2.5 ml of reference solution (a) to 50.0 ml with reference solution (c).

Column:

– *size*: $l = 0.25$ m, $\varnothing = 4$ mm,

– *stationary phase*: base-deactivated octylsilyl silica gel for chromatography *R* (5 μ m),

– *temperature*: 40 °C.

Mobile phase: mix 136 volumes of *acetonitrile R* with 1000 volumes of a 3.48 g/l solution of *sodium pentanesulphonate R* previously adjusted to pH 3.5 with *dilute sulphuric acid R*.

Flow rate: 1.2 ml/min.

Detection: spectrophotometer at 230 nm.

Injection: 20 μ l; inject a blank, the test solution and reference solutions (b), (d) and (e).

Run time: twice the retention time of moxonidine.

Relative retentions with reference to moxonidine (retention time = about 11.6 min): impurity A = about 0.9; impurity B = about 1.7.

System suitability: reference solution (e):

– *resolution*: minimum of 2 between the peaks due to impurity A and moxonidine.

Limits:

– *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (d) (0.3 per cent),

– *impurity B*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent),

– *any other impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),

– *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),

– *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent). Disregard any peak observed with the blank run.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C for 3 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modification.

Injection: test solution and reference solution (a).

Calculate the percentage content of $C_9H_{12}ClN_5O$ from the areas of the peaks and the declared content of *moxonidine CRS*.

IMPURITIES

A. $R_4 = R_6 = Cl$: 4,6-dichloro-*N*-(imidazolidin-2-ylidene)-2-methylpyrimidin-5-amine (6-chloromoxonidine),

B. $R_4 = R_6 = OCH_3$: *N*-(imidazolidin-2-ylidene)-4,6-dimethoxy-2-methylpyrimidin-5-amine (4-methoxymoxonidine),

C. $R_4 = OH$, $R_6 = OCH_3$: 5-[(imidazolidin-2-ylidene)amino]-6-methoxy-2-methylpyrimidin-4-ol (4-hydroxymoxonidine),

D. $R_4 = OH$, $R_6 = Cl$: 6-chloro-5-[(imidazolidin-2-ylidene)amino]-2-methylpyrimidin-4-ol (6-desmethyloxonidine).

01/2005:1853

MULLEIN FLOWER

Verbasci flos

DEFINITION

Dried flower, reduced to the corolla and the androecium, of *Verbascum thapsus* L., *V. densiflorum* Bertol. (*V. thapsiforme* Schrad), and *V. phlomoides* L.

CHARACTERS

Macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The corolla of *V. thapsus* is about 20 mm in diameter, pale yellow, yellow to brown, funnel-shaped with 5 slightly unequal and spreading lobes. The corolla lobes are densely hairy on the outer surface, glabrous on the inner surface, with a fine network of light brown veins. There are 5 stamens, alternating with the petal lobes, 2 of these are long, with glabrous filaments, the other 3 shorter, with densely tormentose filaments. The anthers are attached transversely. In *V. phlomoides* the corolla is up to about 30 mm in diameter, bright yellow to orange, and the anthers are obliquely attached to the filaments. The corolla of *V. densiflorum*, about 30 mm in diameter, is almost flat and deeply divided into 5 slightly unequal lobes, with rounded apices.
- B. Reduce to a powder (355). The powder is yellow or yellowish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows many covering trichomes from the corolla, whole and fragmented; there are pluricellular, of the candelabra type with a central uniseriate axis from which whorls of branch cells arise at the position of the cross walls and at the apex. The covering trichomes from the stamen filaments are unicellular, long, thin-walled and tubular, sometimes with a club-shaped tip; they have a distinctly granular or striated surface. Numerous pollen grains, ovoid with a finely granular exine with 3 pores. Fragments of the fibrous layer of the anther with thickened walls giving a characteristic star-shaped appearance. Yellow fragments of the petals in the surface view, the epidermal cells polygonal and isodiametric; fragments of the mesophyll consisting of irregular parenchymatous cells and scattered spiral vessels.

- C. Thin-layer chromatography (2.2.27).

Test solution. Heat 1.0 g of the powdered drug (355) in 10 ml of *methanol R* in a water-bath at 60 °C for 5 min, with stirring. Cool and filter.

Reference solution. Dissolve 1 mg of *caffeic acid R*, 2.5 mg of *hyperoside R* and 2.5 mg of *rutin R* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: TLC silica gel plate *R*.

Mobile phase: *water R*, *anhydrous formic acid R*, *methyl ethyl ketone R*, *ethyl acetate R* (10:10:30:50 V/V/V/V).

Application: 10 µl of the reference solution and 30 µl of the test solution, as bands.

Development: over a path of 15 cm.

Drying: at 100-105 °C.

Detection: spray the warm plate with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R*. Subsequently spray with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Allow the plate to dry in air for 30 min and examine in ultraviolet light at 365 nm.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Caffeic acid: a greenish-blue fluorescent zone.	A yellow to yellowish-green fluorescent zone.
	A bluish fluorescent zone.
	A greenish fluorescent zone.
	A yellowish-green fluorescent zone.
	A bluish fluorescent zone.
Hyperoside: a yellowish-brown fluorescent zone.	A greenish fluorescent zone.
Rutin: a yellowish-brown fluorescent zone.	
Reference solution	Test solution

- D. Boil 1.0 g of the powdered drug (355) with 15 ml of *water R* for 1 min. Filter. Add 1 ml of *hydrochloric acid R* and boil for 1 min. A greenish-blue colour develops and, after a few minutes, cloudiness appears and then a blackish precipitate (iridoids).

TESTS

Foreign matter (2.8.2): maximum 5 per cent of brown petals and maximum 2 per cent of fragments of the calyx and other foreign matter, determined on 20 g.

Swelling index (2.8.4): minimum 9, determined on the powdered drug (710), humidified with 2 ml of *alcohol R*.

Loss on drying (2.2.32): maximum 12.0 per cent, determined on 1.000 g of the powdered drug (710) by drying in an oven at 100-105 °C for 2 h.

Total ash (2.4.16): maximum 6.0 per cent.

Ash insoluble in hydrochloric acid (2.8.1): maximum 2.0 per cent.

STORAGE

In an airtight container.

01/2005:1450

MUPIROCIN

Mupirocinum

C₂₆H₄₄O₉M_r 500.6

DEFINITION

Mupirocin contains not less than 93.0 per cent and not more than the equivalent of 100.5 per cent of 9-[(2*E*)-4-[(2*S*,3*R*,4*R*,5*S*)-5-[(2*S*,3*S*,4*S*,5*S*)-2,3-epoxy-5-

hydroxy-4-methylhexyl]-3,4-dihydroxy-3,4,5,6-tetrahydro-2H-pyran-2-yl]-3-methylbut-2-enoyl]oxy]nonanoic acid, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white powder, slightly soluble in water, freely soluble in acetone, in ethanol and in methylene chloride.

It shows polymorphism.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of mupirocin*.

TESTS

pH (2.2.3). The pH of a freshly prepared saturated solution (about 10 g/l) in *carbon dioxide-free water R* is 3.5 to 4.0.

Specific optical rotation (2.2.7). Dissolve 0.50 g in *methanol R* and dilute to 10.0 ml with the same solvent. The specific optical rotation is -17 to -21 , calculated with reference to the anhydrous substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in a mixture of equal volumes of *methanol R* and of a 13.6 g/l solution of *sodium acetate R*, adjusted to pH 4.0 with *acetic acid R* and dilute to 10.0 ml with the same mixture of solvents.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with a mixture of equal volumes of *methanol R* and of a 13.6 g/l solution of *sodium acetate R*, adjusted to pH 4.0 with *acetic acid R*.

Reference solution (b). Adjust 10 ml of reference solution (a) to pH 2.0 using *hydrochloric acid R* and allow to stand for 20 h.

Reference solution (c). Dissolve 25 mg of *mupirocin lithium CRS* in a mixture of equal volumes of *methanol R* and of a 13.6 g/l solution of *sodium acetate R*, adjusted to pH 4.0 with *acetic acid R* and dilute to 200.0 ml with the same mixture of solvents.

The chromatographic procedure may be carried out using:

- a column 0.25 m long and 4.6 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 μ m),
- as mobile phase at a flow rate of 1 ml/min a mixture of 20 volumes of *water R*, 30 volumes of *tetrahydrofuran R* and 50 volumes of a 10.5 g/l solution of *ammonium acetate R* previously adjusted to pH 5.7 with *acetic acid R*,
- as detector a spectrophotometer set at 240 nm.

Inject 20 μ l of reference solution (b). The test is not valid unless in the chromatogram obtained, the resolution between the second of the 2 peaks corresponding to hydrolysis products and the peak corresponding to mupirocin is at least 7.0. Inject 20 μ l of reference solution (c). When the chromatogram is recorded in the prescribed conditions, the retention time relative to mupirocin is about 0.75 for impurity C. Inject 20 μ l of the test solution and 20 μ l of reference solution (a). Continue the chromatography of the test solution for 3.5 times the retention time of mupirocin. In the chromatogram obtained with the test solution: the area of any peak corresponding to impurity C is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (4 per cent); the area of any peak, apart from the principal peak and any peak corresponding to impurity C, is not greater than half the area of the principal peak in the chromatogram obtained with

reference solution (a) (1 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (6 per cent). Disregard any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a).

Water (2.5.12). Not more than 1.0 per cent, determined on 0.500 g by the semi-micro determination of water.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in 5 ml of *methanol R* and dilute to 200.0 ml with a 7.5 g/l solution of *ammonium acetate R* adjusted to pH 5.7 with *acetic acid R*.

Reference solution (a). Dissolve 25.0 mg of *mupirocin lithium CRS* in 5 ml of *methanol R* and dilute to 200.0 ml with a 7.5 g/l solution of *ammonium acetate R* adjusted to pH 5.7 with *acetic acid R*.

Reference solution (b). Adjust 10 ml of the test solution to pH 2.0 using *hydrochloric acid R* and allow to stand for 20 h.

The chromatographic procedure may be carried out using:

- a column 0.25 m long and 4.6 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 μ m),
- as mobile phase at a flow rate of 1 ml/min a mixture of 19 volumes of *water R*, 32 volumes of *tetrahydrofuran R* and 49 volumes of a 10.5 g/l solution of *ammonium acetate R* adjusted to pH 5.7 with *acetic acid R*,
- as detector a spectrophotometer set at 230 nm.

Inject 20 μ l of reference solution (b). The test is not valid unless in the chromatogram obtained, the resolution between the second of the 2 peaks corresponding to hydrolysis products and the peak corresponding to mupirocin is at least 7.0. Inject reference solution (a) 6 times. The test is not valid unless the relative standard deviation of the peak area of mupirocin is at most 1.0 per cent. Inject the test solution and reference solution (a).

STORAGE

Protected from light.

C₅₂H₈₆O₁₈Ca, 2H₂OM_r 1075

DEFINITION

Mupirocin calcium contains not less than 93.0 per cent and not more than the equivalent of 100.5 per cent of calcium bis[9-[[[(2*E*)-4-[(2*S*,3*R*,4*R*,5*S*)-3,4-dihydroxy-5-[(2*S*,3*S*)-3-[(1*S*,2*S*)-2-hydroxy-1-methylpropyl]oxiranyl]methyl]tetrahydro-2*H*-pyran-2-yl]-3-methylbut-2-enoyl]oxy]nonanoate], calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white powder, very slightly soluble in water, sparingly soluble in ethanol and in methylene chloride.

IDENTIFICATION

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of mupirocin calcium*.
- B. It gives reaction (a) of calcium (2.3.1).

TESTS

Specific optical rotation (2.2.7). Dissolve 0.50 g in *methanol R* and dilute to 10.0 ml with the same solvent. The specific optical rotation is -16 to -20 , calculated with reference to the anhydrous substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in a mixture of equal volumes of a 13.6 g/l solution of *sodium acetate R*, adjusted to pH 4.0 with *acetic acid R*, and *methanol R*. Dilute to 10.0 ml with the same mixture of solvents.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with a mixture of equal volumes of a 13.6 g/l solution of *sodium acetate R*, adjusted to pH 4.0 with *acetic acid R* and *methanol R*.

Reference solution (b). Adjust 10 ml of reference solution (a) to pH 2.0 using *hydrochloric acid R* and allow to stand for 20 h.

Reference solution (c). Dissolve 25 mg of *mupirocin lithium CRS* in a mixture of equal volumes of a 13.6 g/l solution of *sodium acetate R*, adjusted to pH 4.0 with *acetic acid R*, and *methanol R*. Dilute to 200.0 ml with the same mixture of solvents.

The chromatographic procedure may be carried out using:

- a column 0.25 m long and 4.6 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 μ m),

- as mobile phase at a flow rate of 1 ml/min a mixture of 20 volumes of *water R*, 30 volumes of *tetrahydrofuran R* and 50 volumes of a 10.5 g/l solution of *ammonium acetate R* previously adjusted to pH 5.7 with *acetic acid R*,
- as detector a spectrophotometer set at 240 nm.

Inject 20 µl of reference solution (b). The test is not valid unless in the chromatogram obtained, the resolution between the second of the two peaks corresponding to hydrolysis products and the peak corresponding to mupirocin is at least 7.0. Inject 20 µl of reference solution (c). When the chromatogram is recorded in the prescribed conditions, the retention time relative to mupirocin is about 0.75 for impurity C. Inject 20 µl of the test solution and 20 µl of reference solution (a). Continue the chromatography of the test solution for 3.5 times the retention time of mupirocin. In the chromatogram obtained with the test solution: the area of any peak corresponding to impurity C is not greater than 1.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (2.5 per cent); the area of any peak, apart from the principal peak and any peak corresponding to impurity C, is not greater than half the area of the principal peak in the chromatogram obtained with reference solution (a) (1 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than 2.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (4.5 per cent). Disregard any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a).

Chlorides (2.4.4). Dissolve 10.0 mg in a mixture of 1 ml of *dilute nitric acid R* and 15 ml of *methanol R*. The solution complies with the limit test for chlorides (0.5 per cent).

Water (2.5.12). 3.0 per cent to 4.5 per cent, determined on 0.500 g by the semi-micro determination of water.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in 5 ml of *methanol R* and dilute to 200.0 ml with a 7.5 g/l solution of *ammonium acetate R*, adjusted to pH 5.7 with *acetic acid R*.

Reference solution (a). Dissolve 25.0 mg of *mupirocin lithium CRS* in 5 ml of *methanol R* and dilute to 200.0 ml with a 7.5 g/l solution of *ammonium acetate R*, adjusted to pH 5.7 with *acetic acid R*.

Reference solution (b). Adjust 10 ml of the test solution to pH 2.0 using *hydrochloric acid R* and allow to stand for 20 h.

The chromatographic procedure may be carried out using:

- a column 0.25 m long and 4.6 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 19 volumes of *water R*, 32 volumes of *tetrahydrofuran R* and 49 volumes of a 10.5 g/l solution of *ammonium acetate R* adjusted to pH 5.7 with *acetic acid R*,
- as detector a spectrophotometer set at 230 nm.

Inject 20 µl of the reference solution (b). The test is not valid unless, in the chromatogram obtained, the resolution between the second of the two peaks corresponding to hydrolysis products and the peak corresponding to mupirocin is at least 7.0. Inject reference solution (a) six times. The test is not valid unless the relative standard deviation of the peak area of mupirocin is at most 1.0 per cent. Inject the test solution and the reference solution (a).

Calculate the percentage content of mupirocin calcium by multiplying the percentage content of mupirocin lithium by 1.038.

IMPURITIES

- A. 9-[[[(2E)-4-[(2S,3R,4R,5R)-3,4,5-trihydroxy-5-[[[(2S,3S)-3-[(1S,2S)-2-hydroxy-1-methylpropyl]oxiranyl]methyl]tetrahydro-2H-pyran-2-yl]-3-methylbut-2-enyl]oxy]nonanoic acid (pseudomonic acid B),

01/2005:1349

MYRRH

Myrrha

DEFINITION

Myrrh consists of a gum-resin, hardened in air, obtained by incision or produced by spontaneous exudation from the stem and branches of *Commiphora molmol* Engler and/or other species of *Commiphora*.

CHARACTERS

Myrrh has a bitter taste.

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- The light or dark orange-brown, irregular or roundish grains or pieces of different size show components of various colours. Their surface is mostly covered with grey to yellowish-brown dust.
- Reduce to a powder (355). The powder is brownish-yellow to reddish-brown. Examine under a microscope, using *chloral hydrate solution R*. The powder shows only a few tissue fragments from the original plants including the following: reddish-brown cork fragments; single or grouped polyhedral to elongated stone cells with partly strongly thickened, pitted and lignified walls with a brownish content; fragments of thin-walled parenchyma and sclerenchymatous fibres; irregular prismatic to polyhedral crystals of calcium oxalate, about 10 µm to 25 µm in size.

- Examine the chromatograms obtained in the test for *Commiphora mukul*. Spray the plate with *anisaldehyde solution R*, and examine in daylight while heating at 100 °C to 105 °C for 10 min. The chromatogram obtained with the reference solution shows in the lower third an orange-red zone (thymol) and in the middle third a violet zone (anethole).

The chromatogram obtained with the test solution shows an intense violet zone (furanoeudesma-1,3-diene), exceeding the other zones in size and intensity, above the zone of anethole in the chromatogram obtained with the reference solution; a violet zone similar in position to the zone of anethole in the chromatogram obtained with the reference solution; two intense violet zones similar in position to the zone of thymol in the chromatogram obtained with the reference solution, the upper one corresponding to curzerenone and the lower one to 2-methoxyfuranodiene. Further mostly violet zones are present in the chromatogram obtained with the test solution.

TESTS

Foreign matter (2.8.2). It complies with the test for foreign matter.

Commiphora mukul. Examine by thin-layer chromatography (2.2.27) using a *TLC silica gel plate R*.

Test solution. To 0.5 g of the powdered drug (355) add 5.0 ml of *alcohol R* and warm the mixture on a water-bath for 2 min to 3 min. Cool and filter.

Reference solution. Dissolve 10 mg of *thymol R* and 40 µl of *anethole R* in 10 ml of *alcohol R*.

Apply to the plate as bands 10 µl of each solution. Develop over a path of 15 cm using a mixture of 2 volumes of *ethyl acetate R* and 98 volumes of *toluene R*. Allow the plate to dry in air. Examine in ultraviolet light at 365 nm, the chromatogram obtained with the test solution shows no blue to violet fluorescent zones in the lower third of the chromatogram.

Matter insoluble in alcohol. Not more than 70 per cent. Place 1.00 g of the powdered drug (250) in a flask. Add 30 ml of *alcohol R* and shake vigorously for 10 min. Filter the supernatant through a tared sintered-glass filter (16) avoiding the transfer of sediment from the flask. Repeat the extraction with two quantities, each of 20 ml, of *alcohol R*. Quantitatively transfer the sediment to the filter by rinsing the flask with *alcohol R*. Dry the filter and the residue in an oven at 100 °C to 105 °C and weigh.

Loss on drying (2.2.32). Not more than 15.0 per cent, determined on 1.000 g of powdered drug (355) by drying in an oven at 100 °C to 105 °C for 2 h.

Total ash (2.4.16). Not more than 7.0 per cent.

STORAGE

Store protected from light.

01/2005:1877

MYRRH TINCTURE

Myrrhae tinctura

DEFINITION

Tincture produced from *Myrrh* (1349).

PRODUCTION

The tincture is produced from 1 part of the drug and 5 parts of ethanol (90 per cent V/V) by a suitable procedure.

CHARACTERS

Clear yellowish-brown or orange-brown liquid.

IDENTIFICATION

Thin-layer chromatography (2.2.27).

Test solution. Dilute 5 ml of the tincture to be examined to 10 ml with *alcohol R*.

Reference solution. Dissolve 10 mg of *thymol R* and 40 µl of *anethole R* in 10 ml of *ether R*.

Plate: TLC silica gel plate *R*.

Mobile phase: *ethyl acetate R*, *toluene R* (2:98 *V/V*).

Application: 10 µl, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with *anisaldehyde solution R* and examine in daylight whilst heating at 100-105 °C for 10 min.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones mostly violet, are present in the chromatogram obtained with the test solution.

Top of the plate	
Anethole: a violet zone	An intense violet zone exceeding the others in size and intensity (furanoeudesma-1,3-diene) A violet zone
Thymol: an orange-red zone	Two intense violet zones (curzerenone and below 2-methoxyfuranodiene)
Reference solution	Test solution

TESTS

Ethanol content (2.9.10): 82 per cent *V/V* to 88 per cent *V/V*.

Methanol and 2-propanol (2.9.11): maximum 0.05 per cent *V/V* of methanol and maximum 0.05 per cent *V/V* of 2-propanol.

Dry residue (2.8.16): minimum 4.0 per cent *m/m*.

STORAGE

Plastic containers are not recommended.

NABUMETONE

Nabumetonum

C₁₅H₁₆O₂M_r 228.3

DEFINITION

Nabumetone contains not less than 97.0 per cent and not more than the equivalent of 102.0 per cent of 4-(6-methoxynaphthalen-2-yl)butan-2-one, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, freely soluble in acetone, slightly soluble in methanol.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *nabumetone CRS*.

TESTS

Related substances. Examine by liquid chromatography (2.2.29) as described under Assay.

Inject 20 µl of test solution (a), 20 µl of reference solution (b) and 20 µl of reference solution (c). In the chromatogram obtained with test solution (a): the area of any peak due to impurity F, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.3 per cent); the sum of the areas of any other peak, apart from the principal peak and a peak due to impurity F, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) R.

Water (2.5.12). Not more than 0.2 per cent, determined on 1.000 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution (a). Dissolve 50.0 mg of the substance to be examined in *acetonitrile R* and dilute to 10.0 ml with the same solvent.

Test solution (b). Dilute 1.0 ml of test solution (a) to 25.0 ml with *acetonitrile R*. Dilute 1.0 ml of the solution to 5.0 ml with *acetonitrile R*.

Reference solution (a). Dissolve 20.0 mg of *nabumetone CRS* in *acetonitrile R* and dilute to 10.0 ml with the same solvent. Dilute 1.0 ml of the solution to 50.0 ml with *acetonitrile R*.

Reference solution (b). Dilute 0.5 ml of test solution (a) to 100.0 ml with *acetonitrile R*.

01/2005:1350 Reference solution (c). Dissolve 1.5 mg of *nabumetone impurity F CRS* in *acetonitrile R* and dilute to 100.0 ml with the same solvent.

Reference solution (d). Dissolve 4 mg of *nabumetone impurity D CRS* in *acetonitrile R* and dilute to 100 ml with the same solvent. To 5 ml of the solution, add 5 ml of test solution (b).

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 4.6 mm in internal diameter packed with *base-deactivated octadecylsilyl silica gel for chromatography R* (4 µm),
- as mobile phase at a flow rate of 1 ml/min:

Mobile phase A. A mixture of 12 volumes of *tetrahydrofuran R*, 28 volumes of *acetonitrile for chromatography R* and 60 volumes of a 0.1 per cent V/V solution of *glacial acetic acid R* in *carbon dioxide-free water R* prepared from *distilled water R*,

Mobile phase B. A mixture of 24 volumes of *tetrahydrofuran R*, 56 volumes of *acetonitrile for chromatography R* and 20 volumes of a 0.1 per cent V/V solution of *glacial acetic acid R* in *carbon dioxide-free water R* prepared from *distilled water R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 12	100	0	isocratic
12 - 28	100 → 0	0 → 100	linear gradient
28 - 33	0	100	isocratic
33 - 34	0 → 100	100 → 0	linear gradient
34 - 35	100	0	isocratic

- as detector a spectrophotometer set at 254 nm, maintaining the temperature of the column at 40 °C.

Inject 20 µl of reference solution (b) and 20 µl of reference solution (d). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with reference solution (b) is at least 70 per cent of the full scale of the recorder. When the chromatograms are recorded under the prescribed conditions the retention time for nabumetone is about 11 min. The test is not valid unless, in the chromatogram obtained with reference solution (d), the resolution between the peaks corresponding to nabumetone and impurity D is at least 1.5. Inject reference solution (a) six times. The test is not valid unless the relative standard deviation of the peak area for nabumetone is at most 1.0 per cent. Inject alternately test solution (b) and reference solution (a).

Calculate the percentage content of nabumetone using the chromatogram obtained with reference solution (a).

STORAGE

Store protected from light.

IMPURITIES

A. 3-(6-methoxynaphthalen-2-yl)-5-methylcyclohexanone,

B. (5*RS*)-5-(6-methoxynaphthalen-2-yl)-3-methylcyclohex-2-enone,

C. (2*RS*)-4-(6-methoxynaphthalen-2-yl)butan-2-ol,

D. (*E*)-4-(6-methoxynaphthalen-2-yl)but-3-en-2-one,

E. 1,5-bis(6-methoxynaphthalen-2-yl)pentan-3-one,

F. 6,6'-dimethoxy-2,2'-binaphthalenyl.

01/2005:1789

NADOLOL

Nadololum

$C_{17}H_{27}NO_4$

M_r 309.4

DEFINITION

cis-5-[3-[(1,1-Dimethylethyl)amino]-2-hydroxypropoxy]-1,2,3,4-tetrahydronaphthalene-2,3-diol.

It consists of 2 pairs of enantiomers which are present as 2 racemic compounds: racemate A and racemate B.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: slightly soluble in water, freely soluble in alcohol, practically insoluble in acetone.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: nadolol CRS.

TESTS

Racemate content. Infrared absorption spectrophotometry (2.2.24).

Prepare a mull in *liquid paraffin R* of the substance to be examined (dried substance), adjusting the thickness of the mull to give an absorbance reading of 0.6 ± 0.1 at 1587 cm^{-1} . Record the spectrum from 1667 to 1111 cm^{-1} , using *liquid paraffin R* as reference. Measure the absorbance A_a , corresponding to racemate A, at the maximum at 1266 cm^{-1} and the absorbance A_b , corresponding to racemate B, at the maximum at 1250 cm^{-1} . The ratio A_a/A_b is 0.72 to 1.08 (corresponding to racemate A content of between 40 per cent and 60 per cent).

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in 4.0 ml of *methanol R* and dilute to 100.0 ml with a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R*.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R*. Dilute 5.0 ml of the solution to 50.0 ml with a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R*.

Reference solution (b). Dissolve 20 mg of *pindolol CRS* and 20 mg of the substance to be examined in 20 ml of *methanol R* and dilute to 100.0 ml with a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R*. Dilute 1.0 ml of the solution to 100.0 ml with a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R*.

Reference solution (c). Dilute 5.0 ml of reference solution (a) to 20.0 ml with a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R*.

Column:

- *size*: $l = 0.30\text{ m}$, $\varnothing = 3.9\text{ mm}$,
- *stationary phase*: spherical *end-capped octadecylsilyl silica gel for chromatography R* ($5\text{ }\mu\text{m}$), with a specific surface area of $700\text{ m}^2/\text{g}$, a pore size of 0.9 nm and a carbon loading of 12 per cent.
- *temperature*: $40\text{ }^\circ\text{C}$.

Mobile phase:

- *mobile phase A*: 5.6 g/l solution of *sodium octanesulphonate R* adjusted to pH 3.5 with a 300 g/l solution of *phosphoric acid R*,
- *mobile phase B*: *acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 7	77	23
7 - 30	77 → 65	23 → 35
30 - 45	65	35
45 - 50	65 → 77	35 → 23
50 - 60	77	23

Flow rate: 1 ml/min.

Detection: spectrophotometer at 206 nm.

Injection: 20 μl .

Relative retention with reference to nadolol (retention time = about 18 min): impurity A = 0.25; impurity B = 0.4; impurity C (doublet) = 0.6 and 0.7; impurity D = 1.4; impurity E = 1.6; impurity F = 2.2; impurity G = 2.6.

System suitability: reference solution (b):

- **resolution:** minimum of 8.0 between the peaks due to nadolol and to pindolol.

Limits:

- **correction factors:** for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 1.7; impurity B = 1.7; impurity C = 1.7 (multiply the sum of the areas of the 2 peaks);
- **impurity A, B, C, D, E, F, G:** for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
- **any other impurity:** not more than half the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
- **total:** not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);
- **disregard limit:** area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Heavy metals (2.4.8): maximum 30 ppm.

1.0 g complies with limit test D. Prepare the standard using 3 ml of *lead standard solution* (10 ppm Pb) R.

Loss on drying (2.2.32): maximum 2.0 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C for 3 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 100 ml of *anhydrous acetic acid* R. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 30.94 mg of C₁₇H₂₇NO₄.

IMPURITIES

- A. R1 = OH, R2 = H: *cis*-5-[(2*RS*)-2,3-dihydroxypropoxy]-1,2,3,4-tetrahydronaphthalene-2,3-diol (tetraol),
- B. R1 = OCH₃, R2 = H: *cis*-5-[(2*RS*)-2-hydroxy-3-methoxypropoxy]-1,2,3,4-tetrahydronaphthalene-2,3-diol,
- E. R1 = NH-C(CH₃)₃, R2 = I: *cis*-5-[(2*RS*)-3-[(1,1-dimethylethyl)amino]-2-hydroxypropoxy]-8-iodo-1,2,3,4-tetrahydronaphthalene-2,3-diol,

- C. 5,5'-[(2-hydroxypropane-1,3-diyl)bis(oxy)]bis(*cis*-1,2,3,4-tetrahydronaphthalene-2,3-diol),

- D. 5,5'-[[[(1,1-dimethylethyl)imino]bis[(2-hydroxypropane-1,3-diyl)oxy]]bis(*cis*-1,2,3,4-tetrahydronaphthalene-2,3-diol),

- F. (2*RS*)-1-[(1,1-dimethylethyl)amino]-3-(naphthalen-1-yloxy)propan-2-ol,

- G. (2*RS*)-1-[(1,1-dimethylethyl)amino]-3-[(5,6,7,8-tetrahydronaphthalen-1-yl)oxy]propan-2-ol.

01/2005:1134

NADROPARIN CALCIUM

Nadroparinum calcicum

R = H or SO₃($1/2 \text{ Ca}$), R' = H or SO₃($1/2 \text{ Ca}$) or CO-CH₃
R2 = H and R3 = CO₂($1/2 \text{ Ca}$) or R2 = CO₂($1/2 \text{ Ca}$) and R3 = H

DEFINITION

Nadroparin calcium is the calcium salt of low-molecular-mass heparin obtained by nitrous acid depolymerisation of heparin from pork intestinal mucosa, followed by fractionation to eliminate selectively most of the chains with a molecular mass lower than 2000. The majority of the components have a 2-*O*-sulpho-α-*L*-idopyranosuronic acid structure at the non-reducing end and a 6-*O*-sulpho-2,5-anhydro-*D*-mannitol structure at the reducing end of their chain.

Nadroparin calcium complies with the monograph on *Heparins, low-molecular-mass (0828)* with the modifications and additional requirements below.

The mass-average molecular mass ranges between 3600 and 5000 with a characteristic value of about 4300.

The degree of sulphatation is about 2 per disaccharide unit. The potency is not less than 95 IU and not more than 130 IU of anti-factor Xa activity per milligram, calculated with reference to the dried substance. The ratio of anti-factor Xa activity to anti-factor IIa activity is between 2.5 and 4.0.

IDENTIFICATION

Carry out identification test C as described in the monograph on *Heparins, low-molecular-mass (0828)*. The following requirements apply.

The mass-average molecular mass ranges between 3600 and 5000. The mass percentage of chains lower than 2000 is not more than 15 per cent. The mass percentage of chains between 2000 and 8000 ranges between 75 per cent and 95 per cent. The mass percentage of chains between 2000 and 4000 ranges between 35 per cent and 55 per cent.

TESTS

Appearance of solution. Dissolve 0.5 g of the substance to be examined in 10 ml of *water R*. The solution is not more intensely opalescent than the reference suspension II (2.2.1) and not more intensely coloured than the reference solution Y₅ (2.2.2, *Method II*).

Ethanol. Not more than 1.0 per cent *m/m*, determined by head-space gas chromatography (2.2.28), using *2-propanol R* as the internal standard.

Internal standard solution. Dilute 1.0 ml of *2-propanol R* to 100.0 ml with *water R*. Dilute 1.0 ml of this solution to 50.0 ml with *water R*.

Reference solution. Dilute 1.0 ml of *ethanol R* to 100.0 ml with *water R*. Dilute 0.5 ml of this solution to 20.0 ml with *water R*.

Vial filling. Place the following into four separate vials which can be crimp-sealed and which are compatible with the injection system:

- 1.0 ml of *water R* (blank vial),
- 0.50 ml of the reference solution and 0.50 ml of the internal standard solution (reference vial),
- 10.0 mg of the substance to be examined. Add 1.0 ml of *water R* (test vial A),
- 10.0 mg of the substance to be examined. Add 0.50 ml of *water R* and 0.50 ml of the internal standard solution (test vial B).

The chromatographic procedure may be carried out using:

- a nickel column 1.5 m long and 2 mm in internal diameter packed with *ethylvinylbenzene divinylbenzene copolymer R* (150 µm to 180 µm),
- *helium for chromatography R* or *nitrogen for chromatography R* as the carrier gas at a flow rate of 30 ml/min,
- a flame-ionisation detector.

Maintain the temperature of the column at 150 °C and that of the injection port and that of the detector at 250 °C.

Equilibrate each vial in the head-space system at 90 °C for 15 min. The pre-injection pressurisation time is 1 min.

The chromatogram obtained with the reference vial shows two peaks which correspond in order of increasing retention time to ethanol and 2-propanol (with retention times of approximately 2.5 min and 4 min). Calculate the content of ethanol (*m/m*) taking its density at 20 °C to be 0.792 g/ml.

N-NO groups. Not more than 0.25 ppm, determined by cleavage of the N-NO bond with hydrobromic acid in ethyl acetate under a reflux condenser and detection of the released NO by chemiluminescence.

Description of the apparatus (Figure 1134-1). Use a 500 ml borosilicate glass round-bottomed flask, above which is attached a condenser which is equipped with:

- on one side, a torion joint through which a stream of *argon R* can be introduced via a cannula,

- on the other side, a screw joint with a piston equipped with a septum through which the reference solution and test solution will be injected.

The round-bottomed flask is connected in series to three bubble traps which are themselves connected to two cold traps, which are in turn connected to a chemiluminescence detector. Suitable tubing ensures the junctions are leak-free.

Preparation of the chemiluminescence detector. Switch on the chemiluminescence detector 48 h before use and start the vacuum pump. The vacuum must be less than 0.5 mm Hg. 1 h before use, open the oxygen valve at a pressure of 0.2 MPa and a flow rate of 9.4 ml/min.

Preparation of the bubble trap. In each bubble trap, place 30 ml of a 300 g/l solution of *sodium hydroxide R* in *water R*.

Preparation of the cold traps.

- Trap at –120 °C: Slowly add liquid nitrogen to an isothermic flask containing 250 ml of *ethanol R* whilst stirring with a wooden spatula until a paste is obtained. Place the cold trap in the isothermic flask prepared as described.
- Trap at –160 °C: Slowly add liquid nitrogen to an isothermic flask containing 250 ml of *2-methylbutane R* whilst stirring with a wooden spatula until a paste is obtained. Place the cold trap in the isothermic flask prepared as described.

Drying of the 500 ml borosilicate-glass round-bottomed flask and condenser. Boil 50 ml of *ethyl acetate R* under reflux for 1 h under *argon R* without connecting the system to the chemiluminescence detector.

Test solution. Dry the substance to be examined for 12 h over *diphosphorus pentoxide R* at 60 °C under vacuum. Dissolve 0.10 g of the treated substance to be examined in 1.0 ml of *treated formamide R*. Shake the solution obtained for 30 min.

Reference solution. Dilute 0.1 ml of *nitrosodipropylamine solution R* in 6.0 ml of *ethanol R*. Dilute 0.1 ml of the solution obtained in 1.0 ml of *treated formamide R*. (This solution is equivalent to 0.05 ppm of N-NO groups).

Place 50 ml of *treated ethyl acetate R* in the dry 500 ml borosilicate glass round-bottomed flask equipped with a septum. Connect the round-bottomed flask to the condenser which has been previously cooled to –15 °C for 2 h.

Connect the *argon R* cannula and adjust the flow rate to 0.1 litre/min. Check that the system is leak-free. Only the connector to the chemiluminescence detector remains open in order to avoid excess pressure.

Heat the *treated ethyl acetate R* to boiling.

Evacuate the system by slowly turning the valve of the chemiluminescence detector. At the same time tighten the inlet on the chemiluminescence detector.

When the system is equilibrated, the vacuum reaches 4 mm Hg.

The signal of the zero adjuster on the chemiluminescence detector is set to 10 per cent of the full scale of the recorder.

Through the septum of the 500 ml borosilicate glass round-bottomed flask, sequentially inject 0.5 ml of *water R*, 2.0 ml of *dilute hydrobromic acid R* and then another 2.0 ml of *dilute hydrobromic acid R*, making sure that the recorder pen has returned to the baseline between each injection.

Inject 50.0 µl of the reference solution, then 50.0 µl of the test solution after the recorder pen has returned to the baseline.

Calculate the content of N-NO groups of the substance to be examined.

Bubble traps. Height: 24 cm, internal diameter: 2.5 cm, internal tubing 23 cm in length by 0.5 cm internal diameter. Centrally positioned Rotulex mounting. Equipped with torion joints on the inlet and outlet.

Chemiluminescence detector.

Cold trap. Height: 16.5 cm, internal diameter: 4 cm, internal tubing 14 cm in length and internal diameter 1.3 cm. Equipped with torion joints on the inlet and outlet.

Condenser. Height: 21 cm, internal diameter: 3 cm. Lower rodavis joint and upper torion joint.

Flask. Round-bottomed borosilicate glass flask equipped with a central rodavis joint, a torion joint on the left neck and a 15 cm screw joint on the right neck.

Isothermic flask. Internal depth: 22 cm, internal diameter: 8 cm.

Septum. Silicone material, diameter: 14 mm; thickness: 3.5 mm.

Torion joint.

Tubing. Polytetrafluoroethylene FEP material, internal diameter: 3.2 mm, thickness: 0.8 mm.

Figure 1134.-1. – Apparatus used for the assay of N-NO groups

Free sulphates. Not more than 0.5 per cent, determined by liquid chromatography (2.2.29) using an instrument equipped with a conductivity detector.

Test solution. Dissolve 30.0 mg of the substance to be examined in *water R* and dilute to 10.0 ml with the same solvent.

Reference solution. Dissolve 1.4787 g of *anhydrous sodium sulphate R* in *water R* and dilute to 1000.0 ml with the same solvent. Dilute 1.0 ml of this solution to 200.0 ml with *distilled water R* (5 ppm of sulphate ions).

The chromatographic procedure may be carried out using:

- an anion separation column 50 mm long and 4.6 mm in internal diameter,
- a chemical neutralisation system: neutralisation micromembrane in line with the mobile phase for anion detection,

- elute with a 1.91 g solution of *disodium tetraborate R* in 1000 ml of *water R* as mobile phase for 15 min. Change to 100 per cent of 0.1 M *sodium hydroxide* for a period of 0.5 min. Elute with this solution for 10 min. Return to the initial conditions for a period of 0.5 min. The flow rate is 1.0 ml/min,
- a detector with a sensitivity of 30 µS.

Continuously pump the chemical neutralisation system in counter-flow with a 2.45 g/l solution of *sulphuric acid R*, at a flow rate of 4 ml/min.

Inject 50 µl of each solution. The chromatogram obtained with the reference solution shows a principal peak which corresponds to the sulphate ion (retention time of about 7.5 min). Change the composition of the mobile phase, if necessary, to obtain the prescribed retention time. Calculate the sulphate content of the substance to be examined.

01/2005:1594

NAFTIDROFURYL HYDROGEN OXALATE

Naftidrofuryli hydrogenooxalas

 $C_{26}H_{35}NO_7$ M_r 473.6

DEFINITION

Mixture of 4 stereoisomers of 2-(diethylamino)ethyl 2-[(naphthalen-1-yl)methyl]-3-(tetrahydrofuran-2-yl)propanoate hydrogen oxalate.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: freely soluble in water, freely soluble or soluble in alcohol, slightly or sparingly soluble in acetone.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Preparation: dissolve 1.0 g in *water R* and dilute to 50 ml with the same solvent. Add 2 ml of *concentrated ammonia R* and shake with 3 quantities, each of 10 ml, of *methylene chloride R*. To the combined lower layers, add *anhydrous sodium sulphate R*, shake, filter and evaporate the filtrate at a temperature not exceeding 30 °C, using a rotary evaporator. Use the residue obtained.

Comparison: *Ph. Eur.* reference spectrum of *naftidrofuryl*.

B. Dissolve 0.5 g in *water R* and dilute to 10 ml with the same solvent. Add 2.0 ml of *calcium chloride solution R*. A white precipitate is formed. The precipitate dissolves after the addition of 3.0 ml of *hydrochloric acid R*.

TESTS

Absorbance (2.2.25): maximum 0.1 at 430 nm.

Dissolve 1.5 g in *water R* and dilute to 10 ml with the same solvent. If necessary use an ultrasonic bath.

Related substances

A. Liquid chromatography (2.2.29).

Test solution. Dissolve 80.0 mg of the substance to be examined in the mobile phase and dilute to 20.0 ml with the mobile phase. Treat in an ultrasonic bath for 10 s. A precipitate is formed. Filter through a 0.45 µm membrane filter, discarding the first 5 millilitres. *Use a freshly prepared solution.*

Reference solution (a). Dissolve 5.0 mg of *naftidrofuryl impurity A CRS* in *acetonitrile R* and dilute to 25.0 ml with the same solvent. Dilute 1.0 ml of this solution to 50.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of *naftidrofuryl impurity B CRS* and 5 mg of the substance to be examined in *acetonitrile R* and dilute to 50 ml with the same solvent. Dilute 1 ml of this solution to 50 ml with the mobile phase.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** spherical *end-capped octadecylsilyl silica gel for chromatography R* (5 µm) with a specific surface area of 350 m²/g, a pore size of 10 nm and a carbon loading of 14 per cent.

Mobile phase: mix 60 ml of *methanol R* with 150 ml of *tetrabutylammonium buffer solution pH 7.0 R* and dilute to 1000 ml with *acetonitrile R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 283 nm.

Injection: 20 µl.

Run time: 2.3 times the retention time of *naftidrofuryl*.

Relative retention with reference to *naftidrofuryl* (retention time = about 7 min): *impurity A* = about 0.5; *impurity B* = about 0.8; *impurity C* = about 1.8.

System suitability: reference solution (b):

- **resolution:** minimum 3.0 between the peaks due to *naftidrofuryl* and *impurity B*.

Limits:

- **impurities A, B, C:** for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- **any other impurity:** for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- **total:** not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent),
- **disregard limit:** 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent).

B. Gas chromatography (2.2.28).

Test solution (a). Dissolve 1.0 g of the substance to be examined in *water R* and dilute to 50 ml with the same solvent. Add 2 ml of *concentrated ammonia R* and shake with 3 quantities, each of 10 ml, of *methylene chloride R*. To the combined lower layers, add *anhydrous sodium sulphate R*, shake, filter and evaporate the filtrate at a temperature not exceeding 30 °C, using a rotary evaporator. Take up the residue with *methylene chloride R* and dilute to 20.0 ml with the same solvent.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with *methylene chloride R*.

Reference solution. Dissolve 5 mg of *naftidrofuryl impurity F CRS* in *methylene chloride R* and dilute to 50 ml with the same solvent.

Column:

- **material:** fused silica,
- **size:** $l = 25$ m, $\varnothing = 0.32$ mm,
- **stationary phase:** *poly(dimethyl)(diphenyl)siloxane R* (film thickness 0.45 µm).

Carrier gas: *helium for chromatography R*.

Splitter flow rate: 25 ml/min.

Flow rate: 2.9 ml/min.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 4	210
	4 - 8	210 → 230
	8 - 18	230 → 260
	18 - 30	260
Injection port		290
Detector		290

Detection: flame ionisation.

Injection: 1 µl.

Relative retention with reference to the second eluting peak of naftidrofuryl: impurity D = about 0.14; impurity B = about 0.55 (for the second eluting peak); impurity E = about 0.86; impurity F = about 1.04 (for the second eluting peak).

System suitability: test solution (b):

- *resolution:* minimum 1.0 between the 2 peaks due to the diastereoisomers of naftidrofuryl.

Limits: test solution (a):

- *impurity F:* for the sum of the areas of the 2 peaks, maximum 0.20 per cent of the sum of the areas of the 2 peaks due to naftidrofuryl (0.20 per cent),
- *impurity E:* maximum 0.20 per cent of the sum of the areas of the 2 peaks due to naftidrofuryl (0.20 per cent),
- *impurity D:* maximum 0.10 per cent of the sum of the areas of the 2 peaks due to naftidrofuryl (0.10 per cent),
- *any other impurity:* for each impurity, maximum 0.10 per cent of the sum of the areas of the 2 peaks due to naftidrofuryl (0.10 per cent),
- *total:* maximum 0.50 per cent of the sum of the areas of the 2 peaks due to naftidrofuryl (0.50 per cent),
- *disregard limit:* 0.02 per cent of the sum of the areas of the 2 peaks due to naftidrofuryl (0.02 per cent); disregard any peaks due to impurity B.

Diastereoisomer ratio. Gas chromatography (2.2.28) as described in test B for related substances.

Limits: test solution (b):

- *first eluting naftidrofuryl diastereoisomer:* minimum 30 per cent of the sum of the areas of the 2 peaks due to naftidrofuryl.

Heavy metals (2.4.8): maximum 10 ppm.

In a silica crucible, mix thoroughly 1.0 g of the substance to be examined with 0.5 g of *magnesium oxide R1*. Ignite to dull redness until a homogeneous white or greyish-white mass is obtained. If after 30 min of ignition the mixture remains coloured, allow to cool, mix using a fine glass rod and repeat the ignition. If necessary repeat the operation. Heat at 800 °C for about 1 h. Take up the residue with 2 quantities, each of 5 ml, of a mixture of equal volumes of *hydrochloric acid R1* and *water R*. Add 0.1 ml of *phenolphthalein solution R* and then *concentrated ammonia R* until a pink colour is obtained. Cool, add *glacial acetic acid R* until the solution is decolorised and add 0.5 ml in excess. Filter if necessary and wash the filter. Dilute to 20 ml with *water R*. The solution complies with limit test E. Prepare the standard using 10 ml of *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.350 g in 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 47.36 mg of C₂₆H₃₅NO₇.

IMPURITIES

Specified impurities: A, B, C, D, E, F.

A. R = H: 2-[(naphthalen-1-yl)methyl]-3-(tetrahydrofuran-2-yl)propanoic acid,

B. R = C₂H₅: ethyl 2-[(naphthalen-1-yl)methyl]-3-(tetrahydrofuran-2-yl)propanoate,

C. 2-(diethylamino)ethyl 3-(naphthalen-1-yl)-2-[(naphthalen-1-yl)methyl]propanoate,

D. 2-(diethylamino)ethyl 3-[(2*RS*)-tetrahydrofuran-2-yl]propanoate,

E. 2-(diethylamino)ethyl (2*RS*)-2-[(furan-2-yl)methyl]-3-(naphthalen-1-yl)propanoate,

F. 2-(diethylamino)ethyl 2-[(naphthalen-2-yl)methyl]-3-(tetrahydrofuran-2-yl)propanoate.

01/2005:0701 *Reference solution (b).* Dilute 2 ml of test solution (b) to 10 ml with *methylene chloride R*.

NALIDIXIC ACID

Acidum nalidixicum

$C_{12}H_{12}N_2O_3$

M_r 232.2

DEFINITION

Nalidixic acid contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 1-ethyl-7-methyl-4-oxo-1,4-dihydro-1,8-naphthyridine-3-carboxylic acid, calculated with reference to the dried substance.

CHARACTERS

An almost white or pale yellow, crystalline powder, practically insoluble in water, soluble in methylene chloride, slightly soluble in acetone and in alcohol. It dissolves in dilute solutions of alkali hydroxides.

It melts at about 230 °C.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

- Dissolve 12.5 mg in 0.1 M sodium hydroxide and dilute to 50.0 ml with the same solvent. Dilute 2.0 ml of this solution to 100.0 ml with 0.1 M sodium hydroxide. Examined between 230 nm and 350 nm (2.2.25), the solution shows two absorption maxima, at 258 nm and 334 nm. The ratio of the absorbance measured at 258 nm to that measured at 334 nm is 2.2 to 2.4.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *nalidixic acid CRS*. Examine the substances prepared as discs.
- Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with the test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).
- Dissolve 0.1 g in 2 ml of *hydrochloric acid R*. Add 0.5 ml of a 100 g/l solution of β -naphthol *R* in *alcohol R*. An orange-red colour develops.

TESTS

Absorbance. Dissolve 1.50 g in *methylene chloride R* and dilute to 50.0 ml with the same solvent. The absorbance (2.2.25) measured at 420 nm is not greater than 0.10.

Related substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*.

Test solution (a). Dissolve 0.20 g of the substance to be examined in *methylene chloride R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 20 ml with *methylene chloride R*.

Reference solution (a). Dissolve 20 mg of *nalidixic acid CRS* in *methylene chloride R* and dilute to 20 ml with the same solvent.

Reference solution (c). Dilute 1 ml of reference solution (b) to 10 ml with *methylene chloride R*.

Reference solution (d). Dilute 1 ml of reference solution (b) to 25 ml with *methylene chloride R*.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *dilute ammonia R1*, 20 volumes of *methylene chloride R* and 70 volumes of *alcohol R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (c) (0.1 per cent) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (d).

Heavy metals (2.4.8). 1.0 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in 10 ml of *methylene chloride R* and add 30 ml of *2-propanol R* and 10 ml of *carbon dioxide-free water R*. Keep the titration vessel covered and pass *nitrogen R* through the solution throughout the titration. Keep the temperature of the solution between 15 °C and 20 °C. Titrate with 0.1 M *ethanolic sodium hydroxide*, determining the end-point potentiometrically (2.2.20) using a silver-silver chloride comparison electrode with a sleeve diaphragm or a capillary tip, filled with a saturated solution of *lithium chloride R* in *ethanol R*, and a glass electrode as indicator electrode.

1 ml of 0.1 M *ethanolic sodium hydroxide* is equivalent to 23.22 mg of $C_{12}H_{12}N_2O_3$.

STORAGE

Store in an airtight container, protected from light.

01/2005:0729

NALOXONE HYDROCHLORIDE DIHYDRATE

Naloxoni hydrochloridum dihydricum

$C_{19}H_{22}ClNO_4 \cdot 2H_2O$

M_r 399.9

DEFINITION

Naloxone hydrochloride dihydrate contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of 4,5 α -epoxy-3,14-dihydroxy-17-(prop-2-enyl)morphinan-6-one hydrochloride, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, hygroscopic, freely soluble in water, soluble in alcohol, practically insoluble in toluene.

IDENTIFICATION

First identification: A, C.

Second identification: B, C.

- A. Examine by infrared absorption spectrophotometry (2.2.24) comparing with the spectrum obtained with *naloxone hydrochloride dihydrate CRS*.
- B. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel G plate R*.

Test solution. Dissolve 8 mg of the substance to be examined in 0.5 ml of *water R* and dilute to 1 ml with *methanol R*.

Reference solution. Dissolve 8 mg of *naloxone hydrochloride dihydrate CRS* in 0.5 ml of *water R* and dilute to 1 ml with *methanol R*.

Apply to the plate 5 µl of each solution. Develop protected from light over a path of 10 cm using a mixture of 5 volumes of *methanol R* and 95 volumes of the upper layer from a mixture of 60 ml of *dilute ammonia R2* and 100 ml of *butanol R*. Dry the plate in a current of air. Spray with a freshly prepared 5 g/l solution of *potassium ferricyanide R* in *ferric chloride solution R1*. Examine in daylight. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

- C. It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 0.50 g in *carbon dioxide-free water R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 10.0 ml of solution S add 0.05 ml of *methyl red solution R*. Not more than 0.2 ml of 0.02 M *sodium hydroxide* or 0.02 M *hydrochloric acid* is required to change the colour of the indicator.

Specific optical rotation (2.2.7): –170 to –181, determined on solution S and calculated with reference to the anhydrous substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.125 g of the substance to be examined in 0.1 M *hydrochloric acid* and dilute to 25.0 ml with the same acid.

Reference solution (a). Dissolve 10.0 mg of *naloxone hydrochloride dihydrate CRS* and 10.0 mg of *naloxone impurity A CRS* in 0.1 M *hydrochloric acid* and dilute to 10.0 ml with the same acid. Dilute 1.0 ml to 100.0 ml with 0.1 M *hydrochloric acid*.

Reference solution (b). Dilute 1.0 ml of the test solution to 20.0 ml with 0.1 M *hydrochloric acid*. Dilute 1.0 ml to 10.0 ml with 0.1 M *hydrochloric acid*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.125 m long and 4.0 mm in internal diameter packed with *end-capped octylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.5 ml/min a linear gradient programme using the following conditions:
Mobile phase A. Mix 20 ml of *acetonitrile R*, 40 ml of *tetrahydrofuran R* and 940 ml of a solution prepared as follows: dissolve 1.17 g of *sodium octanesulphonate R* in 1000 ml of *water R*, adjust the pH to 2.0 with a 50 per cent V/V solution of *phosphoric acid R* and filter (octanesulphonic acid solution).
Mobile phase B. Mix 170 ml of *acetonitrile R*, 40 ml of *tetrahydrofuran R* and 790 ml of the octanesulphonic acid solution.

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 40	100 → 0	0 → 100	linear gradient
40 - 50	0	100	isocratic

- as detector a spectrophotometer set at 230 nm, maintaining the temperature of the column at 40 °C.

Inject separately 20 µl of each solution.

The test is not valid unless: the peak corresponding to naloxone in the chromatogram obtained with reference solution (a) has a signal-to-noise ratio of at least ten; in the chromatogram obtained with reference solution (a), the resolution between the peaks corresponding to impurity A and naloxone is not less than four. If necessary, adjust the chromatographic conditions.

When the chromatograms are recorded in the prescribed conditions, the retention time of naloxone is about 11 min and the relative retention time of impurity A is about 0.8 with respect to naloxone.

In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent). Disregard any peak with an area less than 0.1 times that of the principal peak in the chromatogram obtained with reference solution (b).

Water (2.5.12): 7.5 per cent to 11.0 per cent, determined on 0.200 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.2 per cent, determined on 0.50 g.

ASSAY

Dissolve 0.300 g in 50 ml of *alcohol R* and add 5.0 ml of 0.01 M *hydrochloric acid*. Carry out a potentiometric titration (2.2.20), using 0.1 M *ethanolic sodium hydroxide*. Read the volume added between the two points of inflexion.

1 ml of 0.1 M *ethanolic sodium hydroxide* is equivalent to 36.38 mg of C₁₉H₂₂ClNO₄.

STORAGE

Store in an airtight container, protected from light.

IMPURITIES

- A. R1 = R2 = R3 = H: 4,5 α -epoxy-3,14-dihydroxymorphinan-6-one (noroxymorphone),
 B. R1 = R3 = CH₂-CH=CH₂, R2 = H: 4,5 α -epoxy-14-hydroxy-17-(prop-2-enyl)-3-(prop-2-enyloxy)morphinan-6-one (3-*O*-allylnaloxone),
 C. R1 = H, R2 = OH, R3 = CH₂-CH=CH₂: 4,5 α -epoxy-3,10 α ,14-trihydroxy-17-(prop-2-enyl)morphinan-6-one (10 α -hydroxynaloxone),

- D. 7,8-didehydro-4,5 α -epoxy-3,14-dihydroxy-17-(prop-2-enyl)morphinan-6-one (7,8-didehydronaloxone),

- E. 4,5 α :4',5' α -diepoxy-3,3',14,14'-tetrahydroxy-17,17'-bis(prop-2-enyl)-2,2'-bimorphinan-6,6'-dione (2,2'-bisnaloxone).

01/2005:0730

NAPHAZOLINE HYDROCHLORIDE

Naphazolini hydrochloridum

C₁₄H₁₅ClN₂M_r 246.7

DEFINITION

2-(Naphthalen-1-ylmethyl)-4,5-dihydro-1H-imidazole hydrochloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water, soluble in alcohol.

mp: about 259 °C, with decomposition.

IDENTIFICATION

First identification: B.

Second identification: A, C.

- A. Dissolve 50.0 mg in 0.01 M hydrochloric acid and dilute to 250.0 ml with the same acid. Dilute 25.0 ml of the solution to 100.0 ml with 0.01 M hydrochloric acid. Examined between 230 nm and 350 nm (2.2.25), the solution shows 4 absorption maxima, at 270 nm, 280 nm, 287 nm and 291 nm. The ratios of the absorbances measured at the maxima at 270 nm, 287 nm and 291 nm to that measured at the maximum at 280 nm are 0.82 to 0.86, 0.67 to 0.70 and 0.65 to 0.69, respectively.
 B. Infrared absorption spectrophotometry (2.2.24).
Comparison: Ph. Eur. reference spectrum of naphazoline hydrochloride.
 C. It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 0.5 g in carbon dioxide-free water R and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, Method II).

Acidity or alkalinity. To 20 ml of solution S add 0.2 ml of 0.01 M sodium hydroxide and 0.1 ml of methyl red solution R. The solution is yellow. Not more than 0.6 ml of 0.01 M hydrochloric acid is required to change the colour of the solution to red.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 5 mg of 1-naphthylacetic acid R in the mobile phase, add 5 ml of the test solution and dilute to 100 ml with the mobile phase.

Reference solution (b). Dissolve 5.0 mg of naphazoline impurity A CRS in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml to 100.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.0$ mm,
- stationary phase: base-deactivated end-capped octylsilyl silica gel for chromatography R (4 μ m) with a pore size of 6 nm.

Mobile phase: dissolve 1.1 g of sodium octanesulphonate R in a mixture of 5 ml of glacial acetic acid R, 300 ml of acetonitrile R and 700 ml of water R.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 280 nm.

Injection: 20 μ l.

Run time: 3 times the retention time of naphazoline.

Retention time: naphazoline = about 14 min.

System suitability: reference solution (a):

- resolution: minimum 5.0 between the peaks due to naphazoline and to impurity B.

Limits:

- impurity A: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- any other impurity: not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent),

- *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent),
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in a mixture of 5.0 ml of 0.01 M hydrochloric acid and 50 ml of alcohol R. Carry out a potentiometric titration (2.2.20), using 0.1 M sodium hydroxide. Read the volume added between the 2 points of inflexion.

1 ml of 0.1 M sodium hydroxide is equivalent to 24.67 mg of C₁₄H₁₅CIN₂.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A.

Other detectable impurities: B, C, D.

- A. R = CO-NH-[CH₂]₂-NH₂: N-(2-aminoethyl)-2-(naphthalen-1-yl)acetamide (naphthylacetylenediamine),
- B. R = CO₂H: (naphthalen-1-yl)acetic acid (1-naphthylacetic acid),
- C. R = CN: (naphthalen-1-yl)acetonitrile (1-naphthylacetonitrile),

- D. 2-(naphthalen-2-ylmethyl)-4,5-dihydro-1H-imidazole (β-naphazoline).

01/2005:0147

NAPHAZOLINE NITRATE

Naphazolini nitras

C₁₄H₁₅N₃O₃

M_r 273.3

DEFINITION

2-(Naphthalen-1-ylmethyl)-4,5-dihydro-1H-imidazole nitrate.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: sparingly soluble in water, soluble in alcohol.

IDENTIFICATION

First identification: C.

Second identification: A, B, D.

A. Melting point (2.2.14): 167 °C to 170 °C.

B. Dissolve 50.0 mg in 0.01 M hydrochloric acid and dilute to 250.0 ml with the same acid. Dilute 25.0 ml of the solution to 100.0 ml with 0.01 M hydrochloric acid. Examined between 230 nm and 350 nm (2.2.25), the solution shows 4 absorption maxima, at 270 nm, 280 nm, 287 nm and 291 nm. The ratios of the absorbances measured at the maxima at 270 nm, 287 nm and 291 nm to that measured at the maximum at 280 nm are 0.82 to 0.86, 0.67 to 0.70 and 0.65 to 0.69, respectively.

C. Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of naphazoline nitrate.

D. Dissolve 45 mg of the substance to be examined in 2 ml of water R. Add 1 ml of sulphuric acid R. Shake carefully and allow to cool. Add 1 ml of ferrous sulphate solution R2 dropwise along the walls of the container. At the junction of the 2 liquids, a brown colour develops.

TESTS

Solution S. Dissolve 0.5 g in carbon dioxide-free water R, warming gently, and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, Method II).

pH (2.2.3): 5.0 to 6.5 for solution S.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 5 mg of 1-naphthylacetic acid R in the mobile phase, add 5 ml of the test solution and dilute to 100 ml with the mobile phase.

Reference solution (b). Dissolve 5.0 mg of naphazoline impurity A CRS in the mobile phase and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml to 100.0 ml with the mobile phase.

Reference solution (c). Dilute 2.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Column:

- *size:* *l* = 0.25 m, Ø = 4.0 mm,
- *stationary phase:* end-capped base-deactivated octylsilyl silica gel for chromatography R (4 µm) with a pore size of 6 nm.

Mobile phase: dissolve 1.1 g of sodium octanesulphonate R in a mixture of 5 ml of glacial acetic acid R, 300 ml of acetonitrile R and 700 ml of water R.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 280 nm.

Injection: 20 µl.

Run time: 3 times the retention time of naphazoline.

Retention time: naphazoline = about 14 min.

System suitability: reference solution (a):

- *resolution:* minimum 5.0 between the peaks due to naphazoline and impurity B.

Limits:

- *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
- *any other impurity*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent),
- *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent),
- *disregard limit*: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent); disregard any peak due to the nitrate ion.

Chlorides (2.4.4): maximum 330 ppm.

15 ml of solution S complies with the limit test for chlorides.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 30 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 27.33 mg of $C_{14}H_{15}N_3O_3$.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A.

Other detectable impurities: B, C, D.

- A. R = CO-NH-[CH₂]₂-NH₂: *N*-(2-aminoethyl)-2-(naphthalen-1-yl)acetamide (naphthylacetylenediamine),
- B. R = CO₂H: (naphthalen-1-yl)acetic acid (1-naphthylacetic acid),
- C. R = CN: (naphthalen-1-yl)acetonitrile (1-naphthylacetonitrile),

- D. 2-(naphthalen-2-ylmethyl)-4,5-dihydro-1H-imidazole (β-naphazoline).

NAPROXEN

Naproxenum

$C_{14}H_{14}O_3$

M_r 230.3

DEFINITION

Naproxen contains not less than 98.5 per cent and not more than the equivalent of 100.5 per cent of (2*S*)-2-(6-methoxynaphthalen-2-yl)propanoic acid, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, soluble in alcohol and in methanol.

IDENTIFICATION

First identification: A, B, D.

Second identification: A, B, C, E.

- A. It complies with the test for specific optical rotation (see Tests).
- B. Melting point (2.2.14): 154 °C to 158 °C.
- C. Dissolve 40.0 mg in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml of the solution to 100.0 ml with *methanol R*. Examined between 230 nm and 350 nm (2.2.25), the solution shows four absorption maxima, at 262 nm, 271 nm, 316 nm and 331 nm. The specific absorbances at the maxima are 216 to 238, 219 to 241, 61 to 69 and 79 to 87, respectively.
- D. Examine by infrared absorption spectrophotometry (2.2.24) comparing with the spectrum obtained with *naproxen CRS*. Examine the substances prepared as discs, using *potassium bromide R*.
- E. Dissolve about 2 mg in 2 ml of *sulphuric acid R*. The solution is yellow. Add 50 mg of *chloral hydrate R* and shake to dissolve. The solution becomes orange and then orange-red.

TESTS

Appearance of solution. Dissolve 1.25 g in *methanol R* and dilute to 25 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution BY₇ (2.2.2, *Method II*).

Specific optical rotation (2.2.7). Dissolve 0.500 g in *chloroform R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 63 to + 68.5, calculated with reference to the dried substance.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 0.25 g of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution. Dilute 0.5 ml of the test solution to 100 ml with *methanol R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 3 volumes of *glacial acetic acid R*, 9 volumes of *tetrahydrofuran R* and 90 volumes of *toluene R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the

chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) R.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C for 3 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in a mixture of 25 ml of *water* R and 75 ml of *methanol* R. Titrate with 0.1 M *sodium hydroxide*, using 1 ml of *phenolphthalein solution* R as indicator.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 23.03 mg of $C_{28}H_{36}O_{15}$.

STORAGE

Store protected from light.

01/2005:1547

NEOHESPERIDIN-DIHYDROCHALCONE

Neohesperidin-dihydrochalconum

$C_{28}H_{36}O_{15}$

M_r 613

DEFINITION

1-[4-[[2-O-(6-Deoxy- α -L-mannopyranosyl)- β -D-glucopyranosyl]oxy]-2,6-dihydroxyphenyl]-3-(3-hydroxy-4-methoxyphenyl)propan-1-one.

Content: 96.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or yellowish-white powder.

Solubility: practically insoluble in water, freely soluble in dimethyl sulphoxide, soluble in methanol, practically insoluble in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: *neohesperidin-dihydrochalcone* CRS.

B. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with test solution (b) is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (a).

TESTS

Appearance of solution. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y_4 (2.2.2, *Method II*).

Dissolve 0.25 g in *methanol* R and dilute to 25 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Test solution (a). Dissolve 0.10 g of the substance to be examined in *dimethyl sulphoxide* R and dilute to 50.0 ml with the same solvent.

Test solution (b). Dilute 10.0 ml of test solution (a) to 20.0 ml with *dimethyl sulphoxide* R.

Reference solution (a). Dissolve 50.0 mg of *neohesperidin-dihydrochalcone* CRS in *dimethyl sulphoxide* R and dilute to 50.0 ml with the same solvent.

Reference solution (b). Dissolve 4.0 mg of *neohesperidin-dihydrochalcone impurity B* CRS in *dimethyl sulphoxide* R and dilute to 100.0 ml with the same solvent.

Reference solution (c). Dilute 1.0 ml of test solution (a) to 100.0 ml with *dimethyl sulphoxide* R.

Reference solution (d). In order to prepare *in situ* impurity F and impurity G, suspend 0.10 g of the substance to be examined in 10.0 ml of a 100 g/l solution of *sulphuric acid* R. Heat the sample for 5 min on a water-bath. Dilute immediately 1.0 ml of the resulting solution to 50.0 ml with *dimethyl sulphoxide* R.

Column:

- **size:** $l = 0.15$ m, $\varnothing = 3.9$ mm,
- **stationary phase:** spherical *octadecylsilyl silica gel for chromatography* R (4 μ m) with a carbon loading of 7 per cent,
- **temperature:** 30 °C.

Mobile phase: mix 20 volumes of *acetonitrile* R and 80 volumes of a solution prepared by adding 5.0 ml of *glacial acetic acid* R to 1000.0 ml of *water* R.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 282 nm.

Injection: 10 μ l; inject test solution (a) and reference solutions (a), (b), (c) and (d).

Run time: 5 times the retention time of *neohesperidin-dihydrochalcone* which is about 10 min.

Relative retention with reference to *neohesperidin-dihydrochalcone*: impurity B = about 0.4; impurity D = about 0.7; impurity F = about 1.2; impurity G = about 3.7.

System suitability:

- **resolution:** minimum of 2.5 between the first peak (*neohesperidin-dihydrochalcone*) and the second peak (impurity F) in the chromatogram obtained with reference solution (d),
- chromatogram obtained with reference solution (a) is similar to the chromatogram provided with *neohesperidin-dihydrochalcone* CRS.

Limits:

- **impurity B:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (2 per cent),
- **impurity D:** not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (2 per cent),
- **any other impurity:** not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent),

- *total of all impurities apart from impurity B*: not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (2.5 per cent),
- *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Heavy metals (2.4.8): maximum 10 ppm.

2.0 g complies with limit test D. Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) R.

Water (2.5.12): maximum 12.0 per cent, determined on 0.200 g.

Sulphated ash (2.4.14): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances.

Injection: 10 µl; inject test solution (b) and reference solutions (a) and (d).

System suitability:

- *resolution*: minimum of 2.5 between the first peak (neohesperidin-dihydrochalcone) and the second peak (impurity F) in the chromatogram obtained with reference solution (d),
- *repeatability*: reference solution (a).

Calculate the percentage content of $C_{28}H_{36}O_{15}$ using the chromatogram obtained with reference solution (a) and the stated content of $C_{28}H_{36}O_{15}$ in *neohesperidin-dihydrochalcone CRS*, correcting for the water content of the substance to be examined.

STORAGE

Protected from light.

IMPURITIES

- A. 1-[4-[[2-*O*-(6-deoxy- α -L-mannopyranosyl)- β -D-glucopyranosyl]oxy]-2,6-dihydroxyphenyl]ethanone (phloroacetophenone neohesperidoside),

- B. 7-[[2-*O*-(6-deoxy- α -L-mannopyranosyl)- β -D-glucopyranosyl]oxy]-5-hydroxy-2-(3-hydroxy-4-methoxyphenyl)-4*H*-1-benzopyran-4-one (neodiosmin),

- C. (2*RS*)-7-[[2-*O*-(6-deoxy- α -L-mannopyranosyl)- β -D-glucopyranosyl]oxy]-5-hydroxy-2-(3-hydroxy-4-methoxyphenyl)-2,3-dihydro-4*H*-1-benzopyran-4-one (neohesperidin),

- D. 1-[4-[[2-*O*-(6-deoxy- α -L-mannopyranosyl)- β -D-glucopyranosyl]oxy]-2,6-dihydroxyphenyl]-3-(4-hydroxyphenyl)propan-1-one (naringin-dihydrochalcone),

- E. X = Rh: 1-[4-[[6-*O*-(6-deoxy- α -L-mannopyranosyl)- β -D-glucopyranosyl]oxy]-2,6-dihydroxyphenyl]-3-(3-hydroxy-4-methoxyphenyl)propan-1-one (hesperidin-dihydrochalcone),

- F. X = H: 1-[4-[(β -D-glucopyranosyloxy)-2,6-dihydroxyphenyl]-3-(3-hydroxy-4-methoxyphenyl)propan-1-one (hesperetin-dihydrochalcone 7'-glucoside),

- G. 3-(3-hydroxy-4-methoxyphenyl)-1-(2,4,6-trihydroxyphenyl)propan-1-one (hesperetin-dihydrochalcone).

01/2005:0197

NEOMYCIN SULPHATE

Neomycini sulfas

M_r 615 (base)

DEFINITION

Mixture of sulphates of substances produced by the growth of certain selected strains of *Streptomyces fradiae*, the main component being the sulphate of 2-deoxy-4-*O*-(2,6-diamino-2,6-dideoxy- α -D-glucopyranosyl)-5-*O*-[3-*O*-(2,6-diamino-2,6-dideoxy- β -L-idopyranosyl)- β -D-ribofuranosyl]-D-streptamine (neomycin B).

Content: minimum of 680 IU/mg (dried substance).

CHARACTERS

Appearance: white or yellowish-white powder, hygroscopic.

Solubility: very soluble in water, very slightly soluble in alcohol, practically insoluble in acetone.

IDENTIFICATION

A. Examine the chromatograms obtained in the test for related substances.

Results:

- the retention time of the principal peak in the chromatogram obtained with the test solution is approximately the same as that of the principal peak in the chromatogram obtained with reference solution (e),
- it complies with the limits given for impurity C.

B. It gives reaction (a) of sulphates (2.3.1).

TESTS

pH (2.2.3): 5.0 to 7.5.

Dissolve 0.1 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent.

Specific optical rotation (2.2.7): + 53.5 to + 59.0 (dried substance).

Dissolve 1.00 g in *water R* and dilute to 10.0 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 25.0 mg of *framycetin sulphate CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Reference solution (d). Dissolve the contents of a vial of *neamine CRS* (corresponding to 0.5 mg) in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (e). Dissolve 10 mg of *neomycin sulphate CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** base-deactivated octadecylsilyl silica gel for chromatography R (5 μ m),
- **temperature:** 25 °C.

Mobile phase: mix 20.0 ml of *trifluoroacetic acid R*, 6.0 ml of *carbonate-free sodium hydroxide solution R* and 500 ml of *water R*, allow to equilibrate, dilute to 1000 ml with *water R* and degas.

Flow rate: 0.7 ml/min.

Post-column solution: carbonate-free sodium hydroxide solution *R* diluted 1 in 25 previously degassed, which is added pulse-less to the column effluent using a 375 μ l polymeric mixing coil.

Flow rate: 0.5 ml/min.

Detection: pulsed amperometric detector with a gold indicator electrode, a silver-silver chloride reference electrode and a stainless steel auxiliary electrode which is the cell body, held at respectively 0.00 V detection, + 0.80 V oxidation and – 0.60 V reduction potentials, with pulse durations according to the instrument used.

Injection: 10 μ l; inject the test solution and the reference solutions (b), (c), (d) and (e).

Run time: 1.5 times the retention time of neomycin B.

Relative retention with reference to neomycin B (retention time = about 10 min): impurity A = about 0.65; impurity C = about 0.9; impurity G = about 1.1.

System suitability:

- **resolution:** minimum of 2.0 between the peaks due to impurity C and to neomycin B in the chromatogram obtained with reference solution (e); if necessary, adjust the volume of the carbonate-free sodium hydroxide solution in the mobile phase,
- **signal-to-noise ratio:** minimum 10 for the principal peak in the chromatogram obtained with reference solution (c).

Limits:

- **impurity A:** not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (2.0 per cent),
- **impurity C:** not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (15.0 per cent) and not less than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent),
- **any other impurity:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (5.0 per cent),
- **total of other impurities:** not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (15.0 per cent),
- **disregard limit:** area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent).

Sulphate: 27.0 per cent to 31.0 per cent (dried substance).

Dissolve 0.250 g in 100 ml of *water R* and adjust the solution to pH 11 using *concentrated ammonia R*. Add 10.0 ml of 0.1 *M barium chloride* and about 0.5 mg of *phthalein purple R*. Titrate with 0.1 *M sodium edetate* adding 50 ml of *alcohol R* when the colour of the solution begins to change, continuing the titration until the violet-blue colour disappears.

1 ml of 0.1 *M barium chloride* is equivalent to 9.606 mg of SO_4 .

Loss on drying (2.2.32): maximum 8.0 per cent, determined on 1.000 g by drying at 60 °C over *diphosphorus pentoxide R* at a pressure not exceeding 0.7 kPa for 3 h.

Sulphated ash (2.4.14): maximum 1.0 per cent, determined on 1.0 g.

ASSAY

Carry out the microbiological assay of antibiotics (2.7.2). Use *neomycin sulphate for microbiological assay CRS* as the reference substance.

STORAGE

In an airtight container, protected from light.

IMPURITIES

- A. R1 = H, R2 = NH₂: 2-deoxy-4-*O*-(2,6-diamino-2,6-dideoxy-α-D-glucopyranosyl)-D-streptamine (neamine or neomycin A-LP),
- B. R1 = CO-CH₃, R2 = NH₂: 3-*N*-acetyl-2-deoxy-4-*O*-(2,6-diamino-2,6-dideoxy-α-D-glucopyranosyl)-D-streptamine (3-acetylneamine),
- D. R1 = H, R2 = OH: 4-*O*-(2-amino-2-deoxy-α-D-glucopyranosyl)-2-deoxy-D-streptamine (paromamine or neomycin D),

- C. R1 = CH₂-NH₂, R2 = R3 = H, R4 = NH₂: 2-deoxy-4-*O*-(2,6-diamino-2,6-dideoxy-α-D-glucopyranosyl)-5-*O*-[3-*O*-(2,6-diamino-2,6-dideoxy-α-D-glucopyranosyl)-β-D-ribofuranosyl]-D-streptamine (neomycin C),
- E. R1 = R3 = H, R2 = CH₂-NH₂, R4 = OH: 4-*O*-(2-amino-2-deoxy-α-D-glucopyranosyl)-2-deoxy-5-*O*-[3-*O*-(2,6-diamino-2,6-dideoxy-β-L-idopyranosyl)-β-D-ribofuranosyl]-D-streptamine (paromomycin I or neomycin E),
- F. R1 = CH₂-NH₂, R2 = R3 = H, R4 = OH: 4-*O*-(2-amino-2-deoxy-α-D-glucopyranosyl)-2-deoxy-5-*O*-[3-*O*-(2,6-diamino-2,6-dideoxy-α-D-glucopyranosyl)-β-D-ribofuranosyl]-D-streptamine (paromomycin II or neomycin F),
- G. R1 = H, R2 = CH₂-NH₂, R3 = CO-CH₃, R4 = NH₂: 3-*N*-acetyl-2-deoxy-4-*O*-(2,6-diamino-2,6-dideoxy-α-D-glucopyranosyl)-5-*O*-[3-*O*-(2,6-diamino-2,6-dideoxy-β-L-idopyranosyl)-β-D-ribofuranosyl]-D-streptamine (neomycin B-LP).

01/2005:0046

NEOSTIGMINE BROMIDE

Neostigmini bromidum

C₁₂H₁₉BrN₂O₂M_r 303.2

DEFINITION

Neostigmine bromide contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 3-[(dimethylcarbamoyl)oxy]-*N,N,N*-trimethylanilinium bromide, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder or colourless crystals, hygroscopic, very soluble in water, freely soluble in alcohol.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

- A. Dissolve 20 mg in 0.5 *M* sulphuric acid and dilute to 100 ml with the same acid. Examined between 230 nm and 350 nm, the solution shows 2 absorption maxima (2.2.25), at 260 nm and 266 nm. The specific absorbances at the maxima are about 16 and about 14, respectively.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *neostigmine bromide CRS*.
- C. Heat about 50 mg with a mixture of 0.4 g of *potassium hydroxide R* and 2 ml of *alcohol R* on a water-bath for 3 min, replacing the evaporated alcohol. Cool and add 2 ml of *water R* and 2 ml of *diazobenzenesulphonic acid solution R1*. An orange-red colour develops.
- D. It gives the reactions of bromides (2.3.1).

TESTS

Solution S. Dissolve 2.5 g in *distilled water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

(3-Hydroxyphenyl)trimethylammonium bromide. Dissolve 50 mg in a mixture of 1 ml of *sodium carbonate solution R* and 9 ml of *water R*. The absorbance (2.2.25) measured immediately at 294 nm is not greater than 0.25.

Sulphates (2.4.13). 15 ml of solution S complies with the limit test for sulphates (200 ppm).

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.00 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.225 g in 2 ml of *anhydrous formic acid R*. Add 50 ml of *acetic anhydride R*. Titrate with 0.1 *M* perchloric acid, determining the end-point potentiometrically (2.2.20). 1 ml of 0.1 *M* perchloric acid is equivalent to 30.32 mg of C₁₂H₁₉BrN₂O₂.

STORAGE

Store protected from light.

IMPURITIES

- A. 3-hydroxy-*N,N,N*-trimethylanilinium bromide.

01/2005:0626

NEOSTIGMINE METILSULFATE

Neostigmini metilsulfas

 $C_{13}H_{22}N_2O_6S$ M_r 334.4**DEFINITION**

Neostigmine metilsulfate contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 3-[(dimethylcarbamoyl)oxy]-*N,N,N*-trimethylanilinium methyl sulphate, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder or colourless crystals, hygroscopic, very soluble in water, freely soluble in alcohol.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D, E.

A. Melting point (2.2.14): 144 °C to 149 °C.

B. Dissolve 50 mg in 0.5 M sulphuric acid and dilute to 100.0 ml with the same acid. Examined between 230 nm and 350 nm (2.2.25), the solution shows two absorption maxima, at 261 nm and 267 nm. The ratio of the absorbance at the maximum at 267 nm to that at the maximum at 261 nm is 0.84 to 0.87. The identification is not valid unless in the test for resolution (2.2.25) the ratio of the absorbances is not less than 1.9.

C. Examine by infrared absorption spectrophotometry (2.2.24) comparing with the spectrum obtained with *neostigmine metilsulfate CRS*. Examine the substances prepared as discs.

D. To 50 mg add 0.4 g of *potassium hydroxide R* and 2 ml of *alcohol R* and heat on a water-bath for 3 min, replacing the evaporated alcohol. Cool and add 2 ml of *water R* and 2 ml of *diazobenzenesulphonic acid solution R1*. An orange-red colour develops.

E. Dissolve 0.1 g in 5 ml of *distilled water R* and add 1 ml of *barium chloride solution R1*. No precipitate is formed. Add 2 ml of *hydrochloric acid R* and heat in a water-bath for 10 min. A fine, white precipitate is formed.

TESTS

Solution S. Dissolve 2.5 g in *distilled water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 4.0 ml of solution S add 6.0 ml of *water R* and 0.1 ml of *phenolphthalein solution R1*. The solution is colourless. Add 0.3 ml of 0.01 M *sodium hydroxide*; the solution becomes red. Add 0.4 ml of 0.01 M *hydrochloric acid*; the solution becomes colourless. Add 0.1 ml of *methyl red solution R*; the solution becomes red or yellowish-red.

(3-Hydroxyphenyl)trimethylammonium methyl sulphate. Dissolve 50 mg in a mixture of 1 ml of *sodium carbonate solution R* and 9 ml of *water R*. The absorbance (2.2.25) measured immediately at 294 nm is not greater than 0.20.

Sulphates (2.4.13). 15 ml of solution S complies with the limit test for sulphates (200 ppm).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 150 ml of *water R* and add 100 ml of *dilute sodium hydroxide solution R*. Distil collecting the distillate in 40 ml of a 40 g/l solution of *boric acid R* until the total volume in the collecting vessel is about 250 ml. Titrate the solution in the collecting vessel with 0.1 M *hydrochloric acid*, using 0.25 ml of *methyl red mixed solution R* as indicator. Carry out a blank test.

1 ml of 0.1 M *hydrochloric acid* is equivalent to 33.44 mg of $C_{13}H_{22}N_2O_6S$.

STORAGE

Store in a airtight container, protected from light.

01/2005:1351
corrected**NETILMICIN SULPHATE**

Netilmicini sulfas

 $C_{42}H_{92}N_{10}O_{34}S_5$ M_r 1442**DEFINITION**

2-Deoxy-6-*O*-[3-deoxy-4-*C*-methyl-3-(methylamino)-β-*L*-arabinopyranosyl]-4-*O*-(2,6-diamino-2,3,4,6-tetra-deoxy-α-*D*-glycero-hex-4-enopyranosyl)-1-*N*-ethyl-*D*-streptamine sulphate.

Substance obtained by synthesis from sisomicin.

Content: minimum 650 IU/mg (dried substance).

CHARACTERS

Appearance: white or yellowish-white powder, very hygroscopic.

Solubility: very soluble in water, practically insoluble in acetone and in alcohol.

IDENTIFICATION

A. Examine the chromatograms obtained in the test for related substances.

Results: the retention time and size of the principal peak in the chromatogram obtained with test solution (a) are approximately the same as those of the principal peak in the chromatogram obtained with reference solution (a).

B. It gives reaction (a) of sulphates (2.3.1).

TESTS

Solution S. Dissolve 0.80 g in *carbon dioxide-free water R* and dilute to 20.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and its absorbance at 400 nm (2.2.25) has a maximum of 0.08.

pH (2.2.3): 3.5 to 5.5 for solution S.

Specific optical rotation (2.2.7): + 88.0 to + 96.0 (dried substance).

Dissolve 0.50 g in *water R* and dilute to 10.0 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Test solution (a). Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the mobile phase.

Test solution (b). Dilute 1.0 ml of test solution (a) to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 25.0 mg of *netilmicin sulphate CRS* in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (b). Dissolve 25.0 mg of *sisomicin sulphate CRS* in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (c). Dissolve 20.5 mg of *1-N-ethylgaramine sulphate CRS* in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (d). Dilute 1.0 ml of reference solution (a), 1.0 ml of reference solution (b) and 1.0 ml of reference solution (c) to 100.0 ml with the mobile phase.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** *styrene-divinylbenzene copolymer R* (8 μ m) with a pore size of 100 nm,
- **temperature:** 50 °C.

Mobile phase: prepare a solution in *carbon dioxide-free water R* containing 35 g/l of *anhydrous sodium sulphate R*, 0.5 g/l of *sodium octanesulphonate R*, 10 ml/l of *tetrahydrofuran R*, 50 ml/l of 0.2 M *potassium dihydrogenphosphate R* previously adjusted to pH 3.0 with a 22.5 g/l solution of *phosphoric acid R* and degassed.

Flow rate: 1.0 ml/min.

Post-column solution: 20 g/l carbonate-free solution of *sodium hydroxide R* previously degassed, which is added pulse-less to the column effluent using a 375 μ l polymeric mixing coil.

Flow rate: 0.3 ml/min.

Detection: pulsed amperometric detector with a gold indicator electrode, a silver-silver chloride reference electrode and a stainless steel auxiliary electrode which is the cell body, held at respectively + 0.05 V detection, + 0.75 V oxidation and – 0.15 V reduction potentials, with pulse durations according to the instrument used.

Injection: 20 μ l; inject test solutions (a) and (b) and reference solution (d).

Run time: 3 times the retention time of netilmicin.

Retention time: netilmicin = about 12 min.

System suitability:

- **resolution:** minimum of 2.0 between the peaks due to impurity B (first peak) and to impurity A (second peak); minimum of 3.0 between the peaks due to impurity A (second peak) and to netilmicin (third peak) in the chromatogram obtained with reference solution (d). If necessary, adjust the concentration of sodium octanesulphonate in the mobile phase.
- **signal-to-noise ratio:** minimum of 10 for the principal peak in the chromatogram obtained with test solution (b).

Limits:

- **impurity A:** not more than the area of the second peak in the chromatogram obtained with reference solution (d) and taking into account the declared content of *sisomicin sulphate CRS* (1 per cent),
- **impurity B:** not more than the area of the first peak in the chromatogram obtained with reference solution (d) and taking into account the declared content of *1-N-ethylgaramine sulphate CRS* (1 per cent),
- **any other impurity:** not more than the area of the third peak in the chromatogram obtained with reference solution (d) (1 per cent),
- **total of other impurities:** not more than twice the area of the third peak in the chromatogram obtained with reference solution (d) (2 per cent),
- **disregard limit:** any peak with an area less than that of the principal peak in the chromatogram obtained with test solution (b) (0.1 per cent).

Sulphate: 31.5 per cent to 35.0 per cent (dried substance).

Dissolve 0.12 g in 100 ml of *water R* and adjust the solution to pH 11 using *concentrated ammonia R*. Add 30.0 ml of 0.1 M *barium chloride* and about 0.5 mg of *phthalein purple R*. Titrate with 0.1 M *sodium edetate* adding 50 ml of *alcohol R* when the colour of the solution begins to change and continue the titration until the violet-blue colour disappears.

1 ml of 0.1 M *barium chloride* is equivalent to 9.606 mg of SO_4 .

Loss on drying (2.2.32): maximum 15.0 per cent, determined on 0.500 g by drying at 110 °C under high vacuum for 3 h.

Sulphated ash (2.4.14): maximum 1.0 per cent, determined on 0.5 g.

Bacterial endotoxins (2.6.14): less than 1.25 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Carry out the microbiological assay of antibiotics (2.7.2), using the diffusion method.

STORAGE

In an airtight container, protected from light. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

- A. R1 = R2 = R3 = H: 2-deoxy-4-*O*-[3-deoxy-4-*C*-methyl-3-(methylamino)- β -L-arabinopyranosyl]-6-*O*-(2,6-diamino-2,3,4,6-tetra-deoxy- α -D-*glycero*-hex-4-enopyranosyl)-L-streptamine (sisomicin),
- C. R1 = R3 = C₂H₅, R2 = H: 4-*O*-[6-amino-2,3,4,6-tetra-deoxy-2-(ethylamino)- α -D-*glycero*-hex-4-enopyranosyl]-2-deoxy-6-*O*-[3-deoxy-4-*C*-methyl-3-(methylamino)- β -L-arabinopyranosyl]-1-*N*-ethyl-D-streptamine (2'-*N*-ethylnetilmicin),

- B. 2-deoxy-6-*O*-[3-deoxy-4-*C*-methyl-3-(methylamino)- β -L-arabinopyranosyl]-1-*N*-ethyl-D-streptamine (1-*N*-ethylgaramine).

01/2005:1998

NICERGOLINE

Nicergolinum

C₂₄H₂₆BrN₃O₃M_r 484.4

DEFINITION

[(6*aR*,9*R*,10*aS*)-10*a*-Methoxy-4,7-dimethyl-4,6,6*a*,7,8,9,10,10*a*-octahydroindolo[4,3-*fg*]quinolin-9-yl]methyl 5-bromopyridine-3-carboxylate.

Content: 99.0 per cent to 101.0 per cent (anhydrous and solvent-free substance).

CHARACTERS

Appearance: fine to granular, white or yellowish powder.

Solubility: practically insoluble in water, freely soluble in methylene chloride, soluble in alcohol.

It shows polymorphism.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D.

A. Specific optical rotation (2.2.7): + 4.8 to + 5.8 (anhydrous substance).

Dissolve 0.50 g in *alcohol R* and dilute to 10.0 ml with the same solvent.

B. Dissolve 50.0 mg in *alcohol R* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml to 50.0 ml with *alcohol R*. Examined between 220 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 288 nm and an absorption minimum at 251 nm. The specific absorbance at the maximum at 288 nm is 175 to 185 (anhydrous substance).

C. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: *Ph. Eur. reference spectrum of nicergoline.*

If the spectra obtained show differences, dissolve the substance to be examined in *alcohol R*, evaporate to dryness and record a further spectrum using the residue.

D. Dissolve 2 mg in 2 ml of *sulphuric acid R*. A blue colour develops.

TESTS

Appearance of solution. The solution is not more opalescent than reference suspension II (2.2.1) and not more intensely coloured than intensity 5 of the range of reference solutions of the most appropriate colour (2.2.2, *Method II*).

Dissolve 0.5 g in *alcohol R* and dilute to 10 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg in *acetonitrile R* and dilute to 25.0 ml with the same solvent.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *acetonitrile R*. Dilute 10.0 ml of this solution to 50.0 ml with *acetonitrile R*.

Reference solution (b). Dissolve 25.0 mg of the substance to be examined and 10.0 mg of *nicergoline impurity A CRS* in *acetonitrile R* and dilute to 25.0 ml with the same solvent. Dilute 1.0 ml to 100.0 ml with *acetonitrile R*.

Column:

— **size:** *l* = 0.25 m, Ø = 4.6 mm,

— **stationary phase:** octadecylsilyl silica gel for chromatography *R* (5 µm).

Mobile phase: mix 30 volumes of *acetonitrile R*, 35 volumes of *methanol R* and 35 volumes of a freshly prepared solution of 6.8 g/l *potassium dihydrogen phosphate R* previously adjusted to pH 7.0 with *triethylamine R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 288 nm.

Injection: 20 µl.

Run time: twice the retention time of nicergoline.

Relative retention with reference to nicergoline (retention time = about 25 min): impurity B = 0.5.

System suitability: reference solution (b):

— **resolution:** minimum 1.5 between the peaks due to nicergoline and impurity A.

Limits:

— **impurity B:** not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.8 per cent),

- *any other impurity*: not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and not more than 2 such peaks have an area greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),
- *total*: not more than 7.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent),
- *disregard limit*: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Water (2.5.32): maximum 0.5 per cent, determined on 0.100 g.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.400 g in 50 ml of *acetone R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20). Titrate to the 1st point of inflexion.

1 ml of 0.1 M *perchloric acid* is equivalent to 48.44 mg of C₂₄H₂₆BrN₃O₃.

IMPURITIES

- A. R1 = CH₃, R2 = OCH₃, R3 = Cl: [(6a*R*,9*R*,10a*S*)-10a-methoxy-4,7-dimethyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-*fg*]quinolin-9-yl]methyl 5-chloropyridine-3-carboxylate,
- B. R1 = H, R2 = OCH₃, R3 = Br: [(6a*R*,9*R*,10a*S*)-10a-methoxy-7-methyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-*fg*]quinolin-9-yl]methyl 5-bromopyridine-3-carboxylate,
- E. R1 = CH₃, R2 = OH, R3 = Br: [(6a*R*,9*R*,10a*S*)-10a-hydroxy-4,7-dimethyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-*fg*]quinolin-9-yl]methyl 5-bromopyridine-3-carboxylate,
- G. R1 = CH₃, R2 = H, R3 = Br: [(6a*R*,9*R*,10a*R*)-4,7-dimethyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-*fg*]quinolin-9-yl]methyl 5-bromopyridine-3-carboxylate

- C. [(6a*R*,9*R*,10a*S*)-10a-methoxy-4,7-dimethyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-*fg*]quinolin-9-yl]methanol,

- D. 5-bromopyridine-3-carboxylic acid,

- F. [(6a*R*,9*S*,10a*S*)-10a-methoxy-4,7-dimethyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-*fg*]quinolin-9-yl]methyl 5-bromopyridine-3-carboxylate.

01/2005:0679

NICLOSAMIDE, ANHYDROUS

Niclosamidum anhydricum

C₁₃H₈Cl₂N₂O₄

M_r 327.1

DEFINITION

Anhydrous niclosamide contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of 5-chloro-*N*-(2-chloro-4-nitrophenyl)-2-hydroxybenzamide, calculated with reference to the dried substance.

CHARACTERS

Yellowish-white or yellowish, fine crystals, practically insoluble in water, sparingly soluble in acetone, slightly soluble in ethanol.

IDENTIFICATION

First identification: B, E.

Second identification: A, C, D, E.

- A. Melting point (2.2.14): 227 °C to 232 °C.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *anhydrous niclosamide CRS*. Examine as discs prepared using about 0.5 mg of substance and 0.3 g of *potassium bromide R*.
- C. To 50 mg add 5 ml of 1 M *hydrochloric acid* and 0.1 g of *zinc powder R*, heat in a water-bath for 10 min, cool and filter. To the filtrate add 1 ml of a 5 g/l solution of *sodium nitrite R* and allow to stand for 3 min; add 2 ml of a 20 g/l solution of *ammonium sulphamate R*, shake, allow to stand for 3 min and add 2 ml of a 5 g/l solution of *naphthylethylenediamine dihydrochloride R*. A violet colour is produced.
- D. Heat the substance on a copper wire in a non-luminous flame. The flame becomes green.
- E. It complies with the test for loss on drying (see Tests).

TESTS

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 50 mg of the substance to be examined in *methanol R*, heating gently, cool and dilute to 50.0 ml with the same solvent.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with *acetonitrile R*. Dilute 1.0 ml of this solution to 20.0 ml with *acetonitrile R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.125 m long and 4 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow-rate of 1.0 ml/min, a mixture of equal volumes of *acetonitrile R* and a solution containing 2 g/l of *potassium dihydrogen phosphate R*, 1 g/l of *disodium hydrogen phosphate R* and 2 g/l of *tetrabutylammonium hydrogen sulphate R*,
- as detector a spectrophotometer set at 230 nm.

Adjust the sensitivity so that the height of the peak corresponding to niclosamide in the chromatogram obtained with the reference solution is not less than 20 per cent of the full scale of the recorder. Inject 20 µl of each solution and record the chromatogram for twice the retention time of niclosamide. In the chromatogram obtained with the test solution, the sum of the areas of the peaks, apart from the peak corresponding to niclosamide and the peak due to the solvent, is not greater than four times the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent). Disregard any peak with an area less than 10 per cent of the area of the peak corresponding to niclosamide in the chromatogram obtained with the reference solution.

5-Chlorosalicylic acid

Test solution. To 1.0 g of the substance to be examined add 15 ml of *water R*, boil for 2 min, cool, filter through a membrane filter (nominal pore size: 0.45 µm), wash the filter and dilute the combined filtrate and washings to 20.0 ml with *water R*.

Reference solution. Dissolve 30 mg of *5-chlorosalicylic acid R* in 20 ml of *methanol R* and dilute to 100.0 ml with *water R*. Dilute 1.0 ml of the solution to 100.0 ml with *water R*.

To 10.0 ml of the test solution and to 10.0 ml of the reference solution add separately 0.1 ml of *ferric chloride solution R2*. Any violet colour in the test solution is not more intense than that in the reference solution (60 ppm).

2-Chloro-4-nitroaniline

Test solution. To 0.250 g of the substance to be examined add 5 ml of *methanol R*, heat to boiling, cool, add 45 ml of *1 M hydrochloric acid*, heat again to boiling, cool, filter and dilute the filtrate to 50.0 ml with *1 M hydrochloric acid*.

Reference solution. Dissolve 50 mg of *2-chloro-4-nitroaniline R* in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 100.0 ml with *methanol R*. Dilute 2.0 ml of this solution to 20.0 ml with *1 M hydrochloric acid*.

To 10.0 ml of the test solution and to 10.0 ml of the reference solution add separately 0.5 ml of a 5 g/l solution of *sodium nitrite R* and allow to stand for 3 min. Add 1 ml of a 20 g/l solution of *ammonium sulphamate R*, shake, allow to stand for 3 min and add 1 ml of a 5 g/l solution of *naphthylethylenediamine dihydrochloride R*. Any pinkish-violet colour in the test solution is not more intense than that in the reference solution (100 ppm).

Chlorides (2.4.4). To 2 g add a mixture of 1.2 ml of *acetic acid R* and 40 ml of *water R*, boil for 2 min, cool and filter. 2 ml of the filtrate diluted to 15 ml with *water R* complies with the limit test for chlorides (500 ppm).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C for 4 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.3000 g in 80 ml of a mixture of equal volumes of *acetone R* and *methanol R*. Titrate with 0.1 M *tetrabutylammonium hydroxide*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *tetrabutylammonium hydroxide* is equivalent to 32.71 mg of C₁₃H₈Cl₂N₂O₄.

STORAGE

Store in an airtight container, protected from light.

01/2005:0680

NICLOSAMIDE MONOHYDRATE

Niclosamidum monohydricum

C₁₃H₈Cl₂N₂O₄·H₂O

*M*_r 345.1

DEFINITION

Niclosamide monohydrate contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of 5-chloro-*N*-(2-chloro-4-nitrophenyl)-2-hydroxybenzamide, calculated with reference to the dried substance.

CHARACTERS

Yellowish, fine crystals, practically insoluble in water, sparingly soluble in acetone, slightly soluble in ethanol.

IDENTIFICATION

First identification: B, E.

Second identification: A, C, D, E.

- Melting point (2.2.14): 227 °C to 232 °C, determined after drying at 100 °C to 105 °C for 4 h.
- Dry the substance to be examined at 100 °C to 105 °C for 4 h. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *anhydrous niclosamide CRS*. Examine as discs prepared using about 0.5 mg of substance and 0.3 g of *potassium bromide R*.
- To 50 mg add 5 ml of *1 M hydrochloric acid* and 0.1 g of *zinc powder R*, heat in a water-bath for 10 min, cool and filter. To the filtrate add 1 ml of a 5 g/l solution of *sodium nitrite R* and allow to stand for 3 min; add 2 ml of a 20 g/l solution of *ammonium sulphamate R*, shake, allow to stand for 3 min and add 2 ml of a 5 g/l solution of *naphthylethylenediamine dihydrochloride R*. A violet colour is produced.
- Heat the substance on a copper wire in a non-luminous flame. The flame becomes green.
- It complies with the test for loss on drying (see Tests).

TESTS

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 50 mg of the substance to be examined in *methanol R*, heating gently, cool and dilute to 50.0 ml with the same solvent.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with *acetonitrile R*. Dilute 1.0 ml of this solution to 20.0 ml with *acetonitrile R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.125 m long and 4 mm in internal diameter, packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow-rate of 1.0 ml/min, a mixture of equal volumes of *acetonitrile R* and a solution containing 2 g/l of *potassium dihydrogen phosphate R*, 1 g/l of *disodium hydrogen phosphate R* and 2 g/l of *tetrabutylammonium hydrogen sulphate R*,
- as detector a spectrophotometer set at 230 nm.

Adjust the sensitivity so that the height of the peak corresponding to niclosamide in the chromatogram obtained with the reference solution is not less than 20 per cent of full-scale of the recorder. Inject 20 µl of each solution and record the chromatogram for twice the retention time of niclosamide. In the chromatogram obtained with the test solution, the sum of the areas of the peaks, apart from the peak corresponding to niclosamide and the peak due to the solvent, is not greater than four times the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent). Disregard any peak with an area less than 10 per cent of the area of the peak corresponding to niclosamide in the chromatogram obtained with the reference solution.

5-Chlorosalicylic acid

Test solution. To 1.0 g of the substance to be examined add 15 ml of *water R*, boil for 2 min, cool, filter through a membrane filter (nominal pore size: 0.45 µm), wash the filter and dilute the combined filtrate and washings to 20.0 ml with *water R*.

Reference solution. Dissolve 30 mg of *5-chlorosalicylic acid R* in 20 ml of *methanol R* and dilute to 100.0 ml with *water R*. Dilute 1.0 ml of the solution to 100.0 ml with *water R*.

To 10.0 ml of the test solution and to 10.0 ml of the reference solution add separately 0.1 ml of *ferric chloride solution R2*. Any violet colour produced in the test solution is not more intense than that in the reference solution (60 ppm).

2-Chloro-4-nitroaniline

Test solution. To 0.250 g of the substance to be examined add 5 ml of *methanol R*, heat to boiling, cool, add 45 ml of *1 M hydrochloric acid*, heat again to boiling, cool, filter and dilute the filtrate to 50.0 ml with *1 M hydrochloric acid*.

Reference solution. Dissolve 50 mg of *2-chloro-4-nitroaniline R* in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 100.0 ml with *methanol R*. Dilute 2.0 ml of this solution to 20.0 ml with *1 M hydrochloric acid*.

To 10.0 ml of the test solution and to 10.0 ml of the reference solution add separately 0.5 ml of a 5 g/l solution of *sodium nitrite R* and allow to stand for 3 min. Add 1 ml of a 20 g/l solution of *ammonium sulphamate R*, shake, allow to stand for 3 min and add 1 ml of a 5 g/l solution of *naphthylethylenediamine dihydrochloride R*. Any pinkish-violet colour produced in the test solution is not more intense than that in the reference solution (100 ppm).

Chlorides (2.4.4). To 2 g add a mixture of 1.2 ml of *acetic acid R* and 40 ml of *water R*, boil for 2 min, cool and filter. 2 ml of the filtrate diluted to 15 ml with *water R* complies with the limit test for chlorides (500 ppm).

Loss on drying (2.2.32): 4.5 per cent to 6.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C for 4 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.3000 g in 80 ml of a mixture of equal volumes of *acetone R* and *methanol R*. Titrate with *0.1 M tetrabutylammonium hydroxide*, determining the end-point potentiometrically (2.2.20).

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 32.71 mg of $C_{13}H_{18}Cl_2N_2O_4$.

STORAGE

Store protected from light.

01/2005:0047

NICOTINAMIDE

Nicotinamidum

$C_6H_6N_2O$

M_r 122.1

DEFINITION

Nicotinamide contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of pyridine-3-carboxamide, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder or colourless crystals, freely soluble in water and in ethanol.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. Melting point (2.2.14): 128 °C to 131 °C.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *nicotinamide CRS*.

C. Boil 0.1 g with 1 ml of *dilute sodium hydroxide solution R*. Ammonia is evolved which is recognisable by its odour.

D. Dilute 2 ml of solution S (see Tests) to 100 ml with *water R*. To 2 ml of the solution, add 2 ml of *cyanogen bromide solution R* and 3 ml of a 25 g/l solution of *aniline R* and shake. A yellow colour develops.

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₇ (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 6.0 to 7.5.

Related substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel GF₂₅₄ plate R*.

Test solution. Dissolve 0.4 g of the substance to be examined in a mixture of equal volumes of *alcohol R* and *water R* and dilute to 5.0 ml with the same mixture of solvents.

Reference solution. Dilute 0.5 ml of the test solution to 200 ml with a mixture of equal volumes of *alcohol R* and *water R*.

Apply to the plate 5 µl of each solution. Develop over a path of 10 cm using a mixture of 4 volumes of *water R*, 45 volumes of *ethanol R* and 48 volumes of *chloroform R*. Allow the plate to dry and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.25 per cent).

Heavy metals (2.4.8). Dilute 12 ml of solution S to 18 ml with *water R*. 12 ml of the solution complies with limit test A for heavy metals (30 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.00 g by drying *in vacuo* for 18 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 20 ml of *anhydrous acetic acid R*, heating slightly if necessary, and add 5 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*, using *crystal violet solution R* as indicator until the colour changes to greenish-blue.

1 ml of 0.1 M *perchloric acid* is equivalent to 12.21 mg of C₆H₆N₂O.

01/2005:1452

NICOTINE

Nicotinum

C₁₀H₁₄N₂*M*_r 162.2

DEFINITION

Nicotine contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 3-[(2*S*)-1-methylpyrrolidin-2-yl]pyridine, calculated with reference to the anhydrous substance.

CHARACTERS

A colourless or brownish viscous liquid, volatile, hygroscopic, soluble in water, miscible with ethanol.

IDENTIFICATION

- It complies with the test for specific optical rotation (see Tests).
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of nicotine*.

TESTS

Appearance of solution. Dissolve 1.0 g in *water R* and dilute to 10 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₅, BY₅ or R₅ (2.2.2, *Method II*).

Specific optical rotation (2.2.7). Dissolve 1.00 g in *ethanol R* and dilute to 50.0 ml with the same solvent. The specific optical rotation is –140 to –152.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dissolve 4 mg of *nicotine ditartrate CRS* and 2 mg of *myosmine R* in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 0.4 ml of the test solution to 100.0 ml with the mobile phase.

The chromatography may be carried out using:

- a stainless steel column 0.10 m long and 8 mm in internal diameter, packed with *octadecylsilyl silica gel for chromatography R* (4 µm),
- as mobile phase at a flow rate of 1.5 ml/min a solution prepared as follows: dissolve 2.31 g of *sodium dodecyl sulphate R* in a mixture of 250 ml of *acetonitrile R* and 750 ml of a 13.6 g/l solution of *potassium dihydrogen phosphate R*, adjusted to pH 4.5 with *sodium hydroxide R* or *phosphoric acid R*,
- as detector a spectrophotometer set at 254 nm.

Inject 25 µl of reference solution (a). When the chromatograms are recorded in the prescribed conditions the retention times are: nicotine about 13 min and impurity D about 11 min. The test is not valid unless the resolution between the impurity D peak eluting closest to the nicotine peak and the peak due to nicotine is at least 1.5; if necessary, adjust the concentration of acetonitrile in the mobile phase.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 25 µl of reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 25 µl of the test solution and 25 µl of reference solution (b). Continue the chromatography for twice the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.8 per cent). Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Water (2.5.12). Not more than 0.5 per cent, determined on 1.00 g by the semi-micro determination of water.

ASSAY

Dissolve 60.0 mg in 30 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid* determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 8.11 mg of C₁₀H₁₄N₂.

STORAGE

Store, under nitrogen, in an airtight container, protected from light.

IMPURITIES

- (2*S*)-1,2,3,6-tetrahydro-2,3'-bipyridyl (anatabine),

B. 3-(1-methyl-1*H*-pyrrol-2-yl)pyridine (β-nicotyrine),

C. (5*S*)-1-methyl-5-(pyridin-3-yl)pyrrolidin-2-one (cotinine),

D. 3-(4,5-dihydro-3*H*-pyrrol-2-yl)pyridine (myosmine),

E. (1*R*,2*S*)-1-methyl-2-(pyridin-3-yl)pyrrolidine 1-oxide (nicotine *N*-oxide).

01/2005:1792

NICOTINE RESINATE

Nicotini resinas

DEFINITION

Complex of nicotine (3-[(2*S*)-1-methylpyrrolidin-2-yl]pyridine) with a weak cationic exchange resin.

Content: 95.0 per cent to 115.0 per cent of the declared content of nicotine stated on the label (anhydrous substance). It may contain glycerol.

CHARACTERS

Appearance: white or slightly yellowish powder.

Solubility: practically insoluble in water.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Preparation: shake a quantity of the substance to be examined equivalent to 100 mg of nicotine with a mixture of 10 ml of *dilute ammonia R2*, 10 ml of *water R*, 5 ml of *strong sodium hydroxide solution R* and 20 ml of *hexane R* for 5 min. Transfer the upper layer to a beaker and evaporate to produce an oily residue. Record the spectrum of the oily residue as a thin film between *sodium chloride R* plates.

Comparison: *Ph. Eur. reference spectrum of nicotine*.

B. It complies with the test for nicotine release (see Tests).

TESTS

Nicotine release: minimum 70 per cent of the content determined under Assay in 10 min.

Transfer an accurately weighed quantity of the substance to be examined equivalent to about 4 mg of nicotine, to a glass-stoppered test-tube, add 10.0 ml of a 9 g/l solution of *sodium chloride R* previously heated to 37 °C and shake vigorously for 10 min. Immediately filter the liquid through a dry filter paper discarding the first millilitre of filtrate.

Transfer 1.0 ml of the filtrate to a 20 ml volumetric flask, dilute to volume with 0.1 *M hydrochloric acid* and mix. Determine the absorbance (2.2.25) at the minima at about 236 nm and 282 nm and at the maximum at 259 nm using 1.0 ml of a 9 g/l solution of *sodium chloride R* diluted to 20 ml with 0.1 *M hydrochloric acid* as compensation liquid. Calculate the percentage of nicotine release from the expression:

$$\frac{20 \times 10^6 \times (A_{259} - 0.5A_{236} - 0.5A_{282})}{323 \times C \times m}$$

323 = specific absorbance of nicotine at 259 nm,

C = percentage of nicotine in the substance to be examined on the basis of the amount determined in the assay,

m = mass of the substance to be examined, in milligrams,

$A_{259}, A_{236}, A_{282}$ = absorbances of the solution at the wavelength indicated by the subscript.

Related substances. Liquid chromatography (2.2.29).

Test solution. Accurately weigh a quantity of the substance to be examined equivalent to 20 mg of nicotine into a glass-stoppered test-tube, add 5.0 ml of *dilute ammonia R2*, 5.0 ml of *water R* and shake vigorously for 10 min. Centrifuge at about 2000 r/min for 10 min and dilute 3.0 ml of the clear solution to 10.0 ml with a 39.5 g/l solution of *phosphoric acid R*.

Reference solution (a). Weigh 60.0 mg of *nicotine ditartrate CRS* into a glass-stoppered test-tube, add 5.0 ml of *dilute ammonia R2*, 5.0 ml of *water R* and shake until dissolution is complete. Dilute 3.0 ml of the clear solution to 10.0 ml with a 39.5 g/l solution of *phosphoric acid R*.

Reference solution (b). Dissolve 5 mg of *myosmine R* in *acetonitrile R* and dilute to 5.0 ml with the same solvent. To 2.0 ml add 1.0 ml of the clear solution obtained during preparation of reference solution (a) and dilute to 10.0 ml with a 39.5 g/l solution of *phosphoric acid R*.

Reference solution (c). Dilute 1.0 ml of the test solution to 10.0 ml with a 39.5 g/l solution of *phosphoric acid R*. Dilute 1.0 ml to 20.0 ml with the mobile phase.

Column:

- size: *l* = 0.10 m, Ø = 8 mm,
- stationary phase: octadecylsilyl silica gel for chromatography *R* (4 µm).

Mobile phase: dissolve 2.31 g of *sodium dodecyl sulphate R* in a mixture of 250 ml of *acetonitrile R* and 750 ml of a 13.6 g/l solution of *potassium dihydrogen phosphate R* adjusted to pH 4.5 with *dilute sodium hydroxide R* or *dilute phosphoric acid R*.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 50 µl.

Run time: twice the retention time of nicotine.

System suitability: reference solution (b):

- resolution: minimum 1.5 between the peaks due to impurity D and nicotine.

Limits:

- any impurity: not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent),

- *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent),
- *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Water (2.5.12): maximum 5.0 per cent.

Suspend 1.0 g in 20.0 ml of *methanol R*, shake for 30 min and allow to stand for 30 min. Use 10 ml of the methanol layer for the titration. Carry out a blank titration.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances.

Calculate the percentage content of nicotine using the chromatograms obtained with the test solution and reference solution (a) taking into account the declared content of *nicotine ditartrate CRS*.

STORAGE

In an airtight container, protected from light.

LABELLING

The label states the content of nicotine.

IMPURITIES

- A. (2*S*)-1,2,3,6-tetrahydro-2,3'-bipyridyl (anatabine),

- B. 3-(1-methyl-1*H*-pyrrol-2-yl)pyridine (β-nicotyrine),

- C. (5*S*)-1-methyl-5-(pyridin-3-yl)pyrrolidin-2-one (cotinine),

- D. 3-(4,5-dihydro-3*H*-pyrrol-2-yl)pyridine (myosmine),

and epimer at N*

- E. (1*RS*,2*S*)-1-methyl-2-(pyridin-3-yl)pyrrolidine 1-oxide (nicotine *N*-oxide).

NICOTINIC ACID

Acidum nicotinicum

$C_6H_5NO_2$

M_r 123.1

DEFINITION

Nicotinic acid contains not less than 99.5 per cent and not more than the equivalent of 100.5 per cent of pyridine-3-carboxylic acid, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder, soluble in boiling water and in boiling alcohol, sparingly soluble in water. It dissolves in dilute solutions of the alkali hydroxides and carbonates.

IDENTIFICATION

First identification: A, B.

Second identification: A, C.

A. Melting point (2.2.14): 234 °C to 240 °C.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *nicotinic acid CRS*.

C. Dissolve about 10 mg in 10 ml of *water R*. To 2 ml of the solution add 2 ml of *cyanogen bromide solution R* and 3 ml of a 25 g/l solution of *aniline R* and shake. A yellow colour develops.

TESTS

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 0.5 g of the substance to be examined in *water R*, warming slightly if necessary, and dilute to 25 ml with the same solvent.

Reference solution. Dilute 0.5 ml of the test solution to 100 ml with *water R*.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 5 volumes of *water R*, 10 volumes of *anhydrous formic acid R* and 85 volumes of *propanol R*. Dry the plate at 100 °C to 105 °C for 10 min and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Chlorides (2.4.4). Dissolve 0.25 g in *water R*, heating on a water-bath, and dilute to 15 ml with the same solvent. The solution complies with the limit test for chlorides (200 ppm).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C for 1 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 50 ml of *water R*. Titrate with 0.1 M *sodium hydroxide*, using 0.25 ml of *phenolphthalein solution R* as indicator, until a pink colour is obtained. Carry out a blank titration.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 12.31 mg of $C_{17}H_{18}N_2O_6$.

STORAGE

Store protected from light.

01/2005:0627
corrected

NIFEDIPINE

Nifedipinum

$C_{17}H_{18}N_2O_6$

M_r 346.3

DEFINITION

Dimethyl 2,6-dimethyl-4-(2-nitrophenyl)-1,4-dihydropyridine-3,5-dicarboxylate.

Content: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: yellow, crystalline powder.

Solubility: practically insoluble in water, freely soluble in acetone, sparingly soluble in ethanol.

When exposed to daylight and to artificial light of certain wavelengths, it readily converts to a nitrosophenylpyridine derivative. Exposure to ultraviolet light leads to the formation of a nitrophenylpyridine derivative.

Prepare solutions immediately before use in the dark or under long-wavelength light (> 420 nm) and protect them from light.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

A. Melting point (2.2.14): 171 °C to 175 °C.

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: *nifedipine CRS*.

C. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 10 mg of *nifedipine CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: TLC silica gel F_{254} plate *R*.

Mobile phase: *ethyl acetate R*, *cyclohexane R* (40:60 V/V).

Application: 5 µl.

Development: over 3/4 of the plate.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, appearance at 254 nm and size to the principal spot in the chromatogram obtained with the reference solution.

D. To 25 mg in a test tube, add 10 ml of a mixture of 1.5 volumes of *hydrochloric acid R*, 3.5 volumes of *water R* and 5 volumes of *alcohol R* and dissolve with gentle heating. Add 0.5 g of *zinc R* in granules and allow to stand for 5 min with occasional swirling. Filter into a second test tube, add 5 ml of a 10 g/l solution of *sodium nitrite R* to the filtrate and allow to stand for 2 min. Add 2 ml of a 50 g/l solution of *ammonium sulphamate R*, shake vigorously with care and add 2 ml of a 5 g/l solution of *naphthylethylenediamine dihydrochloride R*. An intense red colour develops which persists for not less than 5 min.

TESTS

Impurity D and other basic impurities. Transfer 4 g to a 250 ml conical flask and dissolve in 160 ml of *glacial acetic acid R* using an ultrasonic bath. Titrate with 0.1 M *perchloric acid* using 0.25 ml of *naphtholbenzein solution R* as indicator until the colour changes from brownish-yellow to green. Not more than 0.48 ml of 0.1 M *perchloric acid* is required (0.14 per cent).

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.200 g of the substance to be examined in 20 ml of *methanol R* and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 10 mg of *nifedipine impurity A CRS* in *methanol R* and dilute to 25.0 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *nifedipine impurity B CRS* in *methanol R* and dilute to 25.0 ml with the same solvent.

Reference solution (c). Mix 1.0 ml of reference solution (a), 1.0 ml of reference solution (b) and 0.1 ml of the test solution and dilute to 20.0 ml with the mobile phase. Dilute 2.0 ml of this solution to 10.0 ml with the mobile phase.

Column:

- *size*: $l = 0.15$ m, $\varnothing = 4.6$ mm,
- *stationary phase*: octadecylsilyl silica gel for chromatography *R* (5 µm).

Mobile phase: *acetonitrile R*, *methanol R*, *water R* (9:36:55 V/V/V).

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 235 nm.

Injection: 20 µl; inject the test solution and reference solution (c).

Run time: twice the retention time of nifedipine.

Elution order: impurity A, impurity B, nifedipine.

Retention time: nifedipine = about 15.5 min.

System suitability: reference solution (c):

- *resolution*: minimum 1.5 between the peaks due to impurity A and impurity B and minimum 1.5 between the peaks due to impurity B and nifedipine.

Limits:

- *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.1 per cent),
- *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.1 per cent),

- *any other impurity*: not more than the area of the peak due to nifedipine in the chromatogram obtained with reference solution (c) (0.1 per cent),
- *total*: not more than 0.3 per cent,
- *disregard limit*: 0.1 times the area of the peak due to nifedipine in the chromatogram obtained with reference solution (c) (0.01 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C for 2 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.1300 g in a mixture of 25 ml of *2-methyl-2-propanol R* and 25 ml of *perchloric acid solution R*. Titrate with 0.1 M *cerium sulphate* using 0.1 ml of *ferroin R* as indicator, until the pink colour disappears. Titrate slowly towards the end of the titration. Carry out a blank titration.

1 ml of 0.1 M *cerium sulphate* is equivalent to 17.32 mg of $C_{17}H_{18}N_2O_6$.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C, D.

- A. R = NO₂: dimethyl 2,6-dimethyl-4-(2-nitrophenyl)pyridine-3,5-dicarboxylate (nitrophenylpyridine analogue),
- B. R = NO: dimethyl 2,6-dimethyl-4-(2-nitrosophenyl)pyridine-3,5-dicarboxylate (nitrosophenylpyridine analogue),

- C. methyl 2-(2-nitrobenzylidene)-3-oxobutanoate,

- D. methyl 3-aminobut-2-enoate.

corrected

NIFUROXAZIDE

Nifuroxazidum

$C_{12}H_9N_3O_5$

M_r 275.2

DEFINITION

1-(4-Hydroxybenzoyl)-2-[(5-nitrofuran-2-yl)methylene]-diazane.

Content: 98.5 per cent to 101.5 per cent (dried substance).

CHARACTERS

Appearance: bright yellow, crystalline powder.

Solubility: practically insoluble in water, slightly soluble in alcohol, practically insoluble in methylene chloride.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of nifuroxazide.

TESTS

Specific absorbance (2.2.25): 940 to 1000 at the absorption maximum at 367 nm.

Protected from light, dissolve 10.0 mg in 10 ml of *ethylene glycol monomethyl ether R* and dilute to 100.0 ml with *methanol R*. Dilute 5.0 ml of this solution to 100.0 ml with *methanol R*.

Impurity A: maximum 0.05 per cent.

Test solution (a). Dissolve 1.0 g of the substance to be examined in *dimethyl sulphoxide R* and dilute to 10.0 ml with the same solvent.

Test solution (b). To 5.5 ml of test solution (a) add 50.0 ml of *water R* while stirring. Allow to stand for 15 min and filter.

Reference solution. To 0.5 ml of test solution (a) add 5.0 ml of a 50 mg/l solution of *4-hydroxybenzohydrazide R* in *dimethyl sulphoxide R*. Add 50.0 ml of *water R* while stirring. Allow to stand for 15 min and filter.

Add 0.5 ml of *phosphomolybdotungstic reagent R* and 10.0 ml of *sodium carbonate solution R* separately to 10.0 ml of test solution (b) and to 10.0 ml of the reference solution. Allow to stand for 1 h. Examine the 2 solutions at 750 nm. The absorbance (2.2.25) of the solution obtained with test solution (b) is not greater than that obtained with the reference solution.

Related substances. Liquid chromatography (2.2.29). *Use freshly prepared solutions, protected from light.*

Test solution. Dissolve 0.100 g of the substance to be examined in 15.0 ml of *dimethylformamide R* and dilute to 100.0 ml with the mobile phase. If precipitation occurs, use the supernatant liquid.

Reference solution (a). Dissolve 10.0 mg of *methyl parahydroxybenzoate R* (impurity B) in 2.0 ml of *dimethylformamide R* and dilute to 20.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of the substance to be examined and 10 mg of *methyl parahydroxybenzoate R* in 2 ml of *dimethylformamide R* and dilute to 20 ml with the mobile phase. Dilute 1 ml of this solution to 100 ml with the mobile phase.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** spherical octadecylsilyl silica gel for chromatography *R* (5 μ m) with a specific surface area of 340 m²/g, a pore size of 10 nm and a carbon loading of 19 per cent.

Mobile phase: acetonitrile *R*, water *R* (35:65 V/V).

Flow rate: 1 ml/min.

Detection: spectrophotometer at 280 nm.

Injection: 20 μ l.

Run time: 6 times the retention time of nifuroxazide.

Relative retention with reference to nifuroxazide (retention time = about 6.5 min): impurity A = about 0.4; impurity B = about 1.2; impurity C = about 2.8; impurity D = about 5.2.

System suitability: reference solution (b):

- **resolution:** minimum 3.0 between the peaks due to nifuroxazide and impurity B.

Limits:

- **any impurity:** not more than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent), and not more than 1 such peak has an area greater than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- **total:** not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- **disregard limit:** 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test D. Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) *R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C for 3 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g, if necessary with heating, in 30 ml of *dimethylformamide R* and add 20 ml of *water R*. Titrate with 0.1 *M sodium hydroxide*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 *M sodium hydroxide* is equivalent to 27.52 mg of C₁₂H₉N₃O₅.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C, D.

A. R = NH-NH₂: (4-hydroxybenzoyl)diazane (*p*-hydroxybenzohydrazide),

B. R = OCH₃: methyl 4-hydroxybenzoate,

C. (5-nitrofuran-2-yl)methylene diacetate,

D. 1,2-bis[(5-nitrofuran-2-yl)methylene]diazane (5-nitrofurfural azine).

01/2005:0233

NIKETHAMIDE

Nicethamidum

C₁₀H₁₄N₂O

*M*_r 178.2

DEFINITION

Nikethamide contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of *N,N*-diethylpyridine-3-carboxamide, calculated with reference to the anhydrous substance.

CHARACTERS

An oily liquid or a crystalline mass, colourless or slightly yellowish, miscible with water and with alcohol.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. Dissolve 0.15 g in 0.01 *M hydrochloric acid* and dilute to 100.0 ml with the same acid. Dilute 1.0 ml of this solution to 100.0 ml with 0.01 *M hydrochloric acid*. Examined between 230 nm and 350 nm (2.2.25) in a 2 cm cell, the solution shows a single absorption maximum, at 263 nm. The specific absorbance at the maximum is about 285.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *nikethamide CRS*.

C. Heat 0.1 g with 1 ml of *dilute sodium hydroxide solution R*. Diethylamine is evolved progressively and is recognisable by its characteristic odour and by its turning *red litmus paper R* blue.

D. Dilute 1 ml of solution S (see Tests) to 250 ml with *water R*. To 2 ml of this solution add 2 ml of *cyanogen bromide solution R*. Add 3 ml of a 25 g/l solution of *aniline R* and shake. A yellow colour develops.

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent.

Appearance. The substance to be examined, in liquid form or liquefied by slight heating, is clear (2.2.1) and not more intensely coloured than reference solution Y₅ (2.2.2, Method II).

pH (2.2.3). The pH of solution S is 6.0 to 7.8.

Refractive index (2.2.6). 1.524 to 1.526.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 0.4 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 40 mg of *ethylnicotinamide CRS* in *methanol R* and dilute to 100 ml with the same solvent.

Reference solution (b). Dilute 1 ml of reference solution (a) to 10 ml with *methanol R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 25 volumes of *propanol R* and 75 volumes of *chloroform R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. In the chromatogram obtained with the test solution, any spot corresponding to ethylnicotinamide is not more intense than the spot in the chromatogram obtained with reference solution (a) (1.0 per cent) and any spot, apart from the principal spot and the spot corresponding to ethylnicotinamide, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.1 per cent).

Heavy metals (2.4.8). Dilute 10 ml of solution S to 25 ml with *water R*. 12 ml of this solution complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Water (2.5.12). Not more than 0.3 per cent, determined on 2.00 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in a mixture of 5 ml of *acetic anhydride R* and 20 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 17.82 mg of C₁₃H₁₂N₂O₅S.

01/2005:1548

NIMESULIDE

Nimesulidum

C₁₃H₁₂N₂O₅S

*M*_r 308.3

DEFINITION

N-(4-Nitro-2-phenoxyphenyl)methanesulphonamide.

Content: 98.5 per cent to 101.5 per cent (dried substance).

CHARACTERS

Appearance: yellowish crystalline powder.

Solubility: practically insoluble in water, freely soluble in acetone, slightly soluble in ethanol.

mp: about 149 °C.

It shows polymorphism.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: *nimesulide CRS*.

If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in *acetone R*, evaporate to dryness and record new spectra using the residues.

TESTS

Absorbance (2.2.25): maximum 0.50 at 450 nm.

Dissolve 1.0 g in *acetone R* and dilute to 10.0 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 20 mg of the substance to be examined in 8 ml of *acetonitrile R* and dilute to 20.0 ml with *water R*.

Reference solution (a). Dissolve 10 mg of *nimesulide impurity C CRS* and 10 mg of *nimesulide impurity D CRS* in 20 ml of *acetonitrile R* and dilute to 50.0 ml with *water R*. Dilute 1.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Column:

- *dimensions:* *l* = 0.125 m, Ø = 4.0 mm,
- *stationary phase:* octadecylsilyl silica gel for chromatography *R*.

Mobile phase: a mixture of 35 volumes of *acetonitrile R* and 65 volumes of a 1.15 g/l solution of *ammonium dihydrogen phosphate R* adjusted to pH 7.0 with *ammonia R*.

Flow rate: 1.3 ml/min.

Detection: spectrophotometer at 230 nm.

Injection: 20 µl.

Run time: 7 times the retention time of nimesulide.

System suitability:

- *resolution:* minimum of 2.0 between the 2 principal peaks in the chromatogram obtained with reference solution (a).

Limits:

- *any impurity:* not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- *total:* not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
- *disregard limit:* 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.01 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test D. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 4 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.240 g in 30 ml of previously neutralised *acetone R* and add 20 ml of *water R*. Titrate with 0.1 M sodium hydroxide, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M sodium hydroxide is equivalent to 30.83 mg of $C_{13}H_{12}N_2O_5S$.

IMPURITIES

- A. $R_1 = SO_2CH_3$, $R_2 = H$, $R_3 = R_4 = NO_2$: *N*-(2,4-dinitro-6-phenoxyphenyl)methanesulphonamide,
 B. $R_1 = SO_2CH_3$, $R_2 = R_3 = R_4 = H$: *N*-(2-phenoxyphenyl)methanesulphonamide,
 C. $R_1 = R_2 = R_3 = R_4 = H$: 2-phenoxyaniline,
 D. $R_1 = R_2 = R_4 = H$, $R_3 = NO_2$: 4-nitro-2-phenoxyaniline,
 E. $R_1 = R_2 = SO_2CH_3$, $R_3 = R_4 = H$: *N,N*-bis(methylsulphonyl)-2-phenoxyaniline,
 F. $R_1 = R_2 = SO_2CH_3$, $R_3 = NO_2$, $R_4 = H$: *N,N*-bis(methylsulphonyl)-4-nitro-2-phenoxyaniline,

- G. 4-nitro-2-phenoxyphenol.

01/2005:1245

NIMODIPINE

Nimodipinum

 $C_{21}H_{26}N_2O_7$ M_r 418.4

DEFINITION

Nimodipine contains not less than 98.5 per cent and not more than the equivalent of 101.5 per cent of 2-methoxyethyl 1-methylethyl (4*RS*)-2,6-dimethyl-4-(3-nitrophenyl)-1,4-dihydropyridine-3,5-dicarboxylate, calculated with reference to the dried substance.

CHARACTERS

A light yellow or yellow, crystalline powder, practically insoluble in water, freely soluble in ethyl acetate, sparingly soluble in ethanol.

It shows polymorphism.

Exposure to ultraviolet light leads to the formation of a nitrophenylpyridine derivative.

Prepare solutions immediately before use either protected from light or under long-wavelength light (> 420 nm).

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *nimodipine CRS*. If the spectra obtained in the solid state show differences, record further spectra using 20 g/l solutions in *methylene chloride R* and a 0.2 mm cell.

TESTS

Solution S. Dissolve 1.0 g in *acetone R* and dilute to 20.0 ml with *acetone R*.

Appearance of solution. Solution S is clear (2.2.1).

Optical rotation (2.2.7). The angle of optical rotation, determined on solution S, is -0.10° to $+0.10^\circ$.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 40.0 mg of the substance to be examined in 2.5 ml of *tetrahydrofuran R* and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 2.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 20.0 mg of *nimodipine impurity A CRS* in 2.5 ml of *tetrahydrofuran R* and dilute to 25.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

Reference solution (c). Dilute 0.5 ml of the test solution to 20.0 ml with the mobile phase.

Reference solution (d). Mix 1.0 ml of reference solution (b) and 1.0 ml of reference solution (c) and dilute to 25.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.125 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 μ m),
- as mobile phase at a flow rate of 2.0 ml/min a mixture of 20 volumes of *methanol R*, 20 volumes of *tetrahydrofuran R* and 60 volumes of *water R*,
- as detector a spectrophotometer set at 235 nm, maintaining the temperature of the column at 40 $^\circ$ C.

Adjust the sensitivity of the system so that the height of the peak corresponding to nimodipine in the chromatogram obtained with 20 μ l of reference solution (d) is at least 50 per cent of the full scale of the recorder.

Inject 20 μ l of reference solution (d). When the chromatograms are recorded in the prescribed conditions, the retention times are: impurity A about 7 min and nimodipine about 8 min. The test is not valid unless the resolution between the peaks corresponding to impurity A and nimodipine is at least 1.5.

Inject separately 20 μ l of the test solution and 20 μ l of reference solution (a). Record the chromatogram of the test solution for four times the retention time of nimodipine. In the chromatogram obtained with the test solution: the area of the peak due to impurity A is not greater than the corresponding peak in the chromatogram obtained with reference solution (d) (0.1 per cent); none of the peaks, apart from the principal peak and the peak due to impurity A, has an area greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per

cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Disregard any peak due to the solvent and any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (d).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.180 g with gentle heating in a mixture of 25 ml of 2-methyl-2-propanol *R* and 25 ml of perchloric acid solution *R*. Add 0.1 ml of ferroin *R*. Titrate with 0.1 *M* cerium sulphate. Titrate slowly towards the end of the titration. Carry out a blank titration.

1 ml of 0.1 *M* cerium sulphate is equivalent to 20.92 mg of C₂₁H₂₆N₂O₇.

STORAGE

Store protected from light.

IMPURITIES

A. 2-methoxyethyl 1-methylethyl 2,6-dimethyl-4-(3-nitrophenyl)pyridine-3,5-dicarboxylate,

B. R = CH(CH₃)₂: bis(1-methylethyl) 2,6-dimethyl-4-(3-nitrophenyl)-1,4-dihydropyridine-3,5-dicarboxylate,

C. R = CH₂CH₂OCH₃: bis(2-methoxyethyl) 2,6-dimethyl-4-(3-nitrophenyl)-1,4-dihydropyridine-3,5-dicarboxylate.

01/2005:0415

NITRAZEPAM

Nitrazepamum

C₁₅H₁₁N₃O₃

*M*_r 281.3

DEFINITION

Nitrazepam contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 7-nitro-5-phenyl-1,3-dihydro-2*H*-1,4-benzodiazepin-2-one, calculated with reference to the dried substance.

CHARACTERS

A yellow, crystalline powder, practically insoluble in water, slightly soluble in alcohol.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D, E.

A. Melting point (2.2.14): 226 °C to 230 °C.

B. *Protect the solutions from light and measure the absorbances immediately.* Dissolve 25.0 mg in a 5 g/l solution of sulphuric acid *R* in methanol *R* and dilute to 250.0 ml with the same solvent. Dilute 5.0 ml of the solution to 100.0 ml with a 5 g/l solution of sulphuric acid *R* in methanol *R*. Examined between 230 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 280 nm. The specific absorbance at the maximum is 890 to 950.

C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with nitrazepam CRS.

D. Dissolve about 20 mg in a mixture of 5 ml of hydrochloric acid *R* and 10 ml of water *R*. Boil for 5 min, cool and add 2 ml of a 1 g/l solution of sodium nitrite *R*. Allow to stand for 1 min and add 1 ml of a 5 g/l solution of sulphamic acid *R* and mix. Allow to stand for 1 min and add 1 ml of a 1 g/l solution of naphthylethylenediamine dihydrochloride *R*. A red colour is produced.

E. Dissolve about 10 mg in 1 ml of methanol *R*, warming if necessary, and add 0.05 ml of dilute sodium hydroxide solution *R*. An intense yellow colour is produced.

TESTS

Related substances. Carry out the test protected from light. Examine by thin-layer chromatography (2.2.27), using silica gel GF₂₅₄ *R* as the coating substance.

Test solution. Dissolve 0.2 g of the substance to be examined in acetone *R* and dilute to 10 ml with the same solvent. Prepare the solution immediately before use.

Reference solution (a). Dissolve 10 mg of aminonitrobenzophenone *R* in acetone *R* and dilute to 100 ml with the same solvent. Dilute 10 ml of the solution to 50 ml with acetone *R*.

Reference solution (b). Dissolve 10 mg of nitrazepam impurity A CRS in acetone *R* and dilute to 100 ml with the same solvent. Dilute 10 ml of the solution to 50 ml with acetone *R*.

Reference solution (c). Dilute 1 ml of the test solution to 20 ml with acetone *R*. Dilute 1 ml of this solution to 50 ml with acetone *R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 12 cm using a mixture of 15 volumes of ethyl acetate *R* and 85 volumes of nitromethane *R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. In the chromatogram obtained with the test solution: any spot corresponding to aminonitrobenzophenone is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.1 per cent); any spot corresponding to nitrazepam impurity A is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.1 per cent); any spot apart from the principal spot and the spots corresponding to aminonitrobenzophenone and

nitrazepam impurity A is not more intense than the spot in the chromatogram obtained with reference solution (c) (0.1 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) *R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.00 g by drying in an oven at 100 °C to 105 °C for 4 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 25 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 28.13 mg of $C_{15}H_{11}N_3O_3$.

STORAGE

Store protected from light.

IMPURITIES

A. 3-amino-6-nitro-4-phenylquinolin-2(1H)-one,

B. (2-amino-5-nitrophenyl)phenylmethanone.

01/2005:1246

NITRENDIPINE

Nitrendipinum

$C_{18}H_{20}N_2O_6$

M_r 360.4

DEFINITION

Nitrendipine contains not less than 98.5 per cent and not more than the equivalent of 101.5 per cent of ethyl methyl (4*RS*)-2,6-dimethyl-4-(3-nitrophenyl)-1,4-dihydropyridine-3,5-dicarboxylate, calculated with reference to the dried substance.

CHARACTERS

A yellow, crystalline powder, practically insoluble in water, freely soluble in ethyl acetate, sparingly soluble in ethanol and in methanol.

It shows polymorphism.

Exposure to ultraviolet light leads to the formation of a nitrophenylpyridine derivative

Prepare solutions immediately before use either protected from light or under long-wavelength light (> 420 nm).

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *nitrendipine CRS*. If the spectra obtained in the solid state show differences, record further spectra using 20 g/l solutions in *methylene chloride R* and a 0.2 mm cell.

TESTS

Optical rotation (2.2.7). Dissolve 0.2 g in *acetone R* and dilute to 10.0 ml with the same solvent. The angle of optical rotation is -0.10° to $+0.10^\circ$.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 40.0 mg of the substance to be examined in 2.5 ml of *tetrahydrofuran R* and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dilute 2.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 25.0 ml with the mobile phase.

Reference solution (b). Dissolve 20.0 mg of *nitrendipine impurity A CRS* in 2.5 ml of *tetrahydrofuran R* and dilute to 25.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 20.0 ml with the mobile phase.

Reference solution (c). Dilute 0.5 ml of the test solution to 20.0 ml with the mobile phase.

Reference solution (d). Mix 1.0 ml of reference solution (b) and 1.0 ml of reference solution (c) and dilute to 25.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.125 m long and 4 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 μ m),
- as mobile phase at a flow rate of 1 ml/min a mixture of 14 volumes of *acetonitrile R*, 22 volumes of *tetrahydrofuran R* and 64 volumes of *water R*,
- as detector a spectrophotometer set at 235 nm, maintaining the temperature of the column at 40 °C.

Adjust the sensitivity of the system so that the height of the nitrendipine peak in the chromatogram obtained with 20 μ l of reference solution (d) is at least 50 per cent of the full scale of the recorder.

Inject 20 μ l of reference solution (d). When the chromatogram is recorded in the prescribed conditions, the retention times are: nitrendipine impurity A about 6 min and nitrendipine about 8 min. The test is not valid unless the resolution between the peaks corresponding to nitrendipine impurity A and nitrendipine is at least 2.0.

Inject separately 20 μ l of the test solution and 20 μ l of reference solution (a). Record the chromatogram of the test solution for five times the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of the peak corresponding to nitrendipine impurity A is not greater than the area of the corresponding peak in the chromatogram obtained with reference solution (d) (0.1 per cent); none of the peaks, apart from the principal peak and the peaks corresponding to nitrendipine impurity A

has an area greater than that of the peak corresponding to nitrendipine in the chromatogram obtained with reference solution (a) (0.8 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.2 per cent). Disregard any peak with an area less than 0.5 times the area of the nitrendipine peak in the chromatogram obtained with reference solution (d).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.160 g with gentle heating if necessary in a mixture of 25 ml of *2-methyl-2-propanol R* and 25 ml of *perchloric acid solution R*. Titrate with *0.1 M cerium sulphate*, using *0.1 ml of ferroin R* as indicator. Titrate slowly towards the end of the titration. Carry out a blank titration.

1 ml of *0.1 M cerium sulphate* is equivalent to 18.02 mg of $C_{18}H_{20}N_2O_6$.

STORAGE

Store protected from light.

IMPURITIES

A. ethyl methyl 2,6-dimethyl-4-(3-nitrophenyl)pyridine-3,5-dicarboxylate,

B. $R = CH_3$: dimethyl 2,6-dimethyl-4-(3-nitrophenyl)-1,4-dihydropyridine-3,5-dicarboxylate,

C. $R = CH_2CH_3$: diethyl 2,6-dimethyl-4-(3-nitrophenyl)-1,4-dihydropyridine-3,5-dicarboxylate.

01/2005:1549

NITRIC ACID

Acidum nitricum

 HNO_3
 M_r 63.0

DEFINITION

Nitric acid contains not less than 68.0 per cent *m/m* and not more than 70.0 per cent *m/m* of HNO_3 .

CHARACTERS

A clear, colourless to almost colourless liquid, miscible with water.

It has a relative density of about 1.41.

IDENTIFICATION

- Dilute 1 ml to 100 ml with *water R*. The solution is strongly acid (2.2.4).
- 0.2 ml of the solution obtained in identification test A gives the reaction of nitrates (2.3.1).

TESTS

Appearance of solution. Dilute 2 ml to 10 ml with *water R*. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y_6 (2.2.2, *Method II*).

Chlorides (2.4.4). To 5 g add 10 ml of *water R* and 0.3 ml of *silver nitrate solution R2* and allow to stand for 2 min protected from light. Any opalescence is not more intense than that of a standard prepared in the same manner using 13 ml of *water R*, 0.5 ml of *nitric acid R*, 0.5 ml of *chloride standard solution (5 ppm Cl) R* and 0.3 ml of *silver nitrate solution R2* (0.5 ppm).

Sulphates (2.4.13). To 15 g add 0.2 g of *sodium carbonate R*. After carbon dioxide has evolved, evaporate to dryness. Dissolve the residue in 15 ml of *distilled water R*. The solution complies with the limit test for sulphates (10 ppm).

Iron (2.4.9). Dissolve the residue obtained in the test for sulphated ash in 1 ml of *dilute hydrochloric acid R* and dilute to 20 ml with *water R*. Dilute 1 ml to 10 ml with *water R*. The solution complies with the limit test for iron (10 ppm).

Heavy metals (2.4.8). Carefully evaporate 10.0 g to dryness on a water-bath. Moisten the residue with a few drops of *dilute hydrochloric acid R* and dilute to 20 ml with *water R*. 12 ml of the solution complies with limit test A for heavy metals (2 ppm). Prepare the standard using *lead standard solution (2 ppm Pb) R*.

Sulphated ash. Carefully evaporate 20.00 g to dryness. Moisten the residue with a few drops of *sulphuric acid R* and ignite to dull red. The residue does not exceed 0.01 per cent.

ASSAY

To 0.750 g add 50 ml of *water R* and titrate with *1 M sodium hydroxide*, determining the end-point potentiometrically (2.2.20).

1 ml of *1 M sodium hydroxide* is equivalent to 63.0 mg of HNO_3 .

STORAGE

Store protected from light.

01/2005:1550

NITRIC OXIDE

Nitrogenii oxidum

 NO
 M_r 30.01

DEFINITION

Nitric oxide contains not less than 99.0 per cent *V/V* of NO . This monograph applies to nitric oxide for medicinal use.

CHARACTERS

A colourless gas which turns brown when exposed to air. At 20 °C and at a pressure of 101 kPa, 1 volume dissolves in about 21 volumes of water.

PRODUCTION

Carbon dioxide. Not more than 3000 ppm *V/V*, determined by gas chromatography (2.2.28).

Gas to be examined. The substance to be examined.

Reference gas. Use a mixture containing 3000 ppm V/V of carbon dioxide R1 in nitrogen R.

The chromatography may be carried out using:

- a stainless steel column 3.5 m long and 2 mm in internal diameter packed with *ethylvinylbenzene-divinylbenzene copolymer R*,
- *helium for chromatography R* as the carrier gas at a flow rate of 15 ml/min,
- a thermal conductivity detector,
- a loop injector,

maintaining the temperature of the column at 50 °C.

Inject the gas to be examined and the reference gas. The test is not valid unless the chromatograms obtained show a clear separation of carbon dioxide from nitric oxide.

Calculate the carbon dioxide content in the gas to be examined from the area of the carbon dioxide peak in the chromatogram obtained with the reference gas.

Nitrogen. Not more than 3000 ppm V/V, determined by gas chromatography (2.2.28).

Gas to be examined. The substance to be examined.

Reference gas. Use a mixture containing 3000 ppm V/V of nitrogen R in *helium for chromatography R*.

The chromatography may be carried out using:

- a stainless steel column 3.5 m long and 2 mm in internal diameter packed with *molecular sieve for chromatography R* (0.5 nm),
- *helium for chromatography R* as the carrier gas at a flow rate of 15 ml/min,
- a thermal conductivity detector,
- a loop injector,

maintaining the temperature of the column at 50 °C.

Inject the gas to be examined and the reference gas. The test is not valid unless the chromatograms obtained show a clear separation of nitrogen from nitric oxide.

Calculate the nitrogen content in the gas to be examined from the area of the peak due to nitrogen in the chromatogram obtained with the reference gas.

Nitrogen dioxide. Not more than 400 ppm V/V, determined using an ultraviolet absorption spectrophotometry analyser.

Gas to be examined. The substance to be examined.

Reference gas (a). Use *nitrogen R1*.

Reference gas (b). Use a mixture containing 400 ppm V/V of *nitrogen dioxide R* in *nitrogen R*.

The apparatus consists of the following:

- an ultraviolet-visible light source (analytical wavelength about 400 nm),
- a sample gas cell through which the feed gas flows,
- a closed reference gas cell containing *nitrogen R1* in parallel with the sample gas cell,
- a rotating chopper which feeds light alternately through the reference gas cell and the sample gas cell,
- a semiconductor detector which generates a frequency modulated output whose amplitude is a measure of the difference of absorption of the sample gas and the reference gas.

Carry out the analysis in the following way:

- set the zero of the instrument using reference gas (a) through the sample gas cell at a flow rate of 1 litre/min,
- adjust the span while feeding reference gas (b) through the sample gas cell at a flow rate of 1 litre/min,

- feed the gas to be examined through the sample gas cell at a flow rate of 1 litre/min, read the value from the instrument output and calculate if necessary the concentration of nitrogen dioxide.

Nitrous oxide. Not more than 3000 ppm V/V, determined by gas chromatography (2.2.28).

Gas to be examined. The substance to be examined.

Reference gas. Use a mixture containing 3000 ppm V/V of *nitrous oxide R* in *nitrogen R*.

The chromatography may be carried out using:

- a stainless steel column 3.5 m long and 2 mm in internal diameter packed with *ethylvinylbenzene-divinylbenzene copolymer R*,
- *helium for chromatography R* as the carrier gas at a flow rate of 15 ml/min,
- a thermal conductivity detector,
- a loop injector,

maintaining the temperature of the column at 50 °C.

Inject the gas to be examined and the reference gas. The test is not valid unless the chromatograms obtained show a clear separation of nitrous oxide from nitric oxide.

Calculate the nitrous oxide content in the gas to be examined from the area of the peak due to nitrous oxide in the chromatogram obtained with the reference gas.

Water. Not more than 100 ppm V/V, determined using an electrolytic hygrometer (2.5.28).

Assay. Determine the content of nitric oxide by difference using the mass balance equation after determining the sum of the impurities described under Production.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of nitric oxide*.

STORAGE

Store compressed at a pressure not exceeding 2.5 MPa (25 bars) measured at 15 °C, in suitable containers complying with the legal regulations.

IMPURITIES

- carbon dioxide,
- nitrogen,
- nitrogen dioxide,
- nitrous oxide,
- water.

01/2005:1135

NITROFURAL

Nitrofuralum

$C_6H_6N_4O_4$

M_r 198.1

DEFINITION

Nitrofural contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of 2-[(5-nitrofuran-2-yl)methylene]diazanecarboxamide, calculated with reference to the dried substance.

CHARACTERS

A yellow or brownish-yellow, crystalline powder, very slightly soluble in water, slightly soluble in alcohol.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

- Carry out the test protected from bright light.* Use the solution prepared for the assay. Examined between 220 nm and 400 nm (2.2.25), the solution shows two absorption maxima, at 260 nm and 375 nm. The ratio of the absorbance measured at the maximum at 375 nm to that measured at the maximum at 260 nm is 1.15 to 1.30.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *nitrofural CRS*. Examine the substances prepared as discs.
- Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.
Test solution. Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.
Reference solution. Dissolve 10 mg of *nitrofural CRS* in *methanol R* and dilute to 10 ml with the same solvent. Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *methanol R* and 90 volumes of *nitromethane R*. Allow the plate to dry in air and spray with *phenylhydrazine hydrochloride solution R*. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.
- Dissolve about 1 mg in 1 ml of *dimethylformamide R* and add 0.1 ml of *alcoholic potassium hydroxide solution R*. A violet-red colour is produced.

TESTS

pH (2.2.3). To 1.0 g add 100 ml of *carbon dioxide-free water R*. Shake and filter. The pH of the filtrate is 5.0 to 7.0.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.10 g of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 10.0 mg of (5-nitro-2-furyl)methylene diacetate *R* in the mobile phase and dilute to 20.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 10 mg of *nitrofural CRS* and 10 mg of *nitrofurantoin R* in the mobile phase and dilute to 100 ml with the mobile phase. Dilute 5 ml of this solution to 100 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml per minute a mixture of 40 volumes of *acetonitrile R* and 60 volumes of *water R*,
- as detector a spectrophotometer set at 310 nm.

Inject 20 µl of reference solution (a). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained is not less than 50 per cent of the full scale of the recorder. Inject 20 µl of reference solution (b). The test is not valid unless, in the chromatogram obtained,

the resolution between the peaks due to nitrofurantoin and nitrofural is at least 2.0. Inject 20 µl of the test solution and 20 µl of reference solution (a). Continue the chromatography for ten times the retention time of nitrofural, which is about 3 min. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Disregard any peak with an area less than 0.05 times that of the principal peak in the chromatogram obtained with reference solution (a).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Carry out the assay protected from bright light. Dissolve 60.0 mg in 20 ml of *dimethylformamide R* and dilute to 500.0 ml with *water R*. Dilute 5.0 ml to 100.0 ml with *water R*. Prepare a reference solution in the same manner using 60.0 mg of *nitrofural CRS*. Measure the absorbances (2.2.25) of the two solutions at the maximum at 375 nm. Calculate the content of C₈H₆N₄O₅ from the absorbances measured and the concentrations of the solutions.

STORAGE

Store protected from light.

IMPURITIES

A. bis[(5-nitrofuran-2-yl)methylene]diazane,

B. (5-nitrofuran-2-yl)methylene diacetate.

01/2005:0101

NITROFURANTOIN

Nitrofurantoinum

C₈H₆N₄O₅M_r 238.2

DEFINITION

Nitrofurantoin contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of 1-[(5-nitrofuran-2-yl)methylene]aminolimidazolidine-2,4-dione, calculated with reference to the dried substance.

CHARACTERS

A yellow, crystalline powder or yellow crystals, odourless or almost odourless, very slightly soluble in water and in alcohol, soluble in dimethylformamide.

IDENTIFICATION

- A. *Carry out the test protected from bright light.* Use the solution prepared for the assay. Examined between 220 nm and 400 nm (2.2.25), the solution shows two absorption maxima, at 266 nm and 367 nm. The ratio of the absorbance at the maximum at 367 nm to that at the maximum at 266 nm is 1.36 to 1.42.
- B. Dissolve about 10 mg in 10 ml of *dimethylformamide R*. To 1 ml of the solution add 0.1 ml of 0.5 M alcoholic *potassium hydroxide*. A brown colour develops.

TESTS

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel HF₂₅₄ R* as the coating substance.

Test solution. Dissolve 0.25 g of the substance to be examined in a minimum of *dimethylformamide R* and dilute to 10 ml with *acetone R*.

Reference solution. Dilute 1 ml of the test solution to 100 ml with *acetone R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *methanol R* and 90 volumes of *nitromethane R*. Allow the plate to dry in air and heat at 100 °C to 105 °C for 5 min. Examine in ultraviolet light at 254 nm. Spray with *phenylhydrazine hydrochloride solution R*. Heat the plate at 100 °C to 105 °C for a further 10 min. When examined in ultraviolet light and after spraying, any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (1.0 per cent).

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.00 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Carry out the assay protected from bright light. Dissolve 0.120 g in 50 ml of *dimethylformamide R* and dilute to 1000.0 ml with *water R*. Dilute 5.0 ml of the solution to 100.0 ml with a solution containing 18 g/l of *sodium acetate R* and 0.14 per cent V/V of *glacial acetic acid R*. Measure the absorbance (2.2.25) at the absorption maximum at 367 nm, using the sodium acetate solution described above as compensation liquid.

Calculate the content of C₈H₆N₄O₅, taking the specific absorbance to be 765.

STORAGE

Store protected from light, at a temperature below 25 °C.

DEFINITION

Nitrogen contains not less than 99.5 per cent V/V of N₂. This monograph applies to nitrogen for medicinal use.

CHARACTERS

A colourless, odourless gas. At 20 °C and at a pressure of 101 kPa, 1 volume dissolves in about 62 volumes of water and about 10 volumes of alcohol.

PRODUCTION

Carbon dioxide. Not more than 300 ppm V/V, determined using an infrared analyser (2.5.24).

Gas to be examined. The substance to be examined. It must be filtered to avoid stray light phenomena.

Reference gas (a). Use *nitrogen R1*.

Reference gas (b). Use a mixture containing 300 ppm V/V of *carbon dioxide R1* in *nitrogen R1*.

Calibrate the apparatus and set the sensitivity using reference gases (a) and (b). Measure the content of carbon dioxide in the gas to be examined.

Carbon monoxide. Not more than 5 ppm V/V, determined using an infrared analyser (2.5.25).

Gas to be examined. The substance to be examined. It must be filtered to avoid stray light phenomena.

Reference gas (a). Use *nitrogen R1*.

Reference gas (b). Use a mixture containing 5 ppm V/V of *carbon monoxide R* in *nitrogen R1*.

Calibrate the apparatus and set the sensitivity using reference gases (a) and (b). Measure the content of carbon monoxide in the gas to be examined.

Oxygen. Not more than 50 ppm V/V, determined using an oxygen analyser with a detector scale ranging from 0 ppm V/V to 100 ppm V/V and equipped with an electrochemical cell.

The gas to be examined passes through a detection cell containing an aqueous solution of an electrolyte, generally potassium hydroxide. The presence of oxygen in the gas to be examined produces variation in the electric signal recorded at the outlet of the cell that is proportional to the oxygen content.

Calibrate the analyser according to the instructions of the manufacturer. Pass the gas to be examined through the analyser using a suitable pressure regulator and airtight metal tubes and operating at the prescribed flow-rates until constant readings are obtained.

Water. Not more than 67 ppm V/V, determined using an electrolytic hygrometer (2.5.28).

Assay. Examine by gas chromatography (2.2.28).

Gas to be examined. The substance to be examined.

Reference gas (a). Use ambient air.

Reference gas (b). Use *nitrogen R1*.

The chromatographic procedure may be carried out using:

- a stainless steel column 2 m long and 2 mm in internal diameter packed with an appropriate molecular sieve for chromatography (0.5 nm),
- *helium for chromatography R* as the carrier gas at a flow rate of 40 ml/min,
- a thermal conductivity detector,
- a loop injector,

maintaining the temperature of the column at 50 °C and that of the detector at 130 °C.

Inject reference gas (a). Adjust the injected volumes and operating conditions so that the height of the peak due to nitrogen in the chromatogram obtained with the reference

01/2005:1247

NITROGEN

Nitrogenium

N₂M_r 28.01

gas is at least 35 per cent of the full scale of the recorder. The assay is not valid unless the chromatograms obtained show a clear separation of oxygen and nitrogen.

Inject the gas to be examined and reference gas (b). Calculate the content of N₂ in the gas to be examined.

IDENTIFICATION

First identification: A.

Second identification: B, C.

- A. Examine the chromatograms obtained in the Assay. The retention time of the principal peak in the chromatogram obtained with the substance to be examined is approximately the same as that of the principal peak in the chromatogram obtained with reference gas (b).
- B. In a 250 ml conical flask replace the air by the substance to be examined. Place a burning or glowing splinter of wood in the flask. The splinter is extinguished.
- C. In a suitable test tube, place 0.1 g of *magnesium R* in turnings. Close the tube with a two-hole stopper fitted with a glass tube reaching about 1 cm above the turnings. Pass the substance to be examined through the glass tube for 1 min without heating, then for 15 min while heating the test tube to a red glow. After cooling, add 5 ml of *dilute sodium hydroxide solution R*. The evolving vapours change the colour of moistened *red litmus paper R* blue.

TESTS

Carbon dioxide. Not more than 300 ppm V/V, determined using a carbon dioxide detector tube (2.1.6).

Carbon monoxide. Not more than 5 ppm V/V, determined using a carbon monoxide detector tube (2.1.6).

Water vapour. Not more than 67 ppm V/V, determined using a water vapour detector tube (2.1.6).

STORAGE

Store as a compressed gas or a liquid in appropriate containers complying with the legal regulations.

IMPURITIES

- A. carbon dioxide,
- B. carbon monoxide,
- C. oxygen,
- D. water.

01/2005:1685

NITROGEN, LOW-OXYGEN

Nitrogenium oxygenio depletum

N₂

M_r 28.01

DEFINITION

This monograph applies to nitrogen which is used for inerting finished medicinal products which are particularly sensitive to degradation by oxygen. It does not necessarily apply to nitrogen used in earlier production steps.

Content: minimum 99.5 per cent V/V of N₂, calculated by deduction of the sum of impurities found when performing the test for impurities.

CHARACTERS

Colourless and odourless gas.

Solubility: at 20 °C and at a pressure of 101 kPa, 1 volume dissolves in about 62 volumes of water and about 10 volumes of alcohol.

PRODUCTION

Oxygen: maximum 5 ppm V/V, determined using an oxygen analyser with a detector scale ranging from 0 ppm V/V to 100 ppm V/V and equipped with an electrochemical cell.

The gas to be examined passes through a detection cell containing an aqueous solution of an electrolyte, generally potassium hydroxide. The presence of oxygen in the gas to be examined produces variation in the electric signal recorded at the outlet of the cell that is proportional to the oxygen content.

Calibrate the analyser according to the manufacturer's instructions. Pass the gas to be examined through the analyser using a suitable pressure regulator and airtight metal tubes and operating at the prescribed flow rates until constant readings are obtained.

Impurities. Gas chromatography (2.2.28).

Gas to be examined. The substance to be examined.

Reference gas (a). Use ambient air.

Reference gas (b). Use *nitrogen R1*.

Column:

- *material:* stainless steel,
- *size:* *l* = 2 m, Ø = 2 mm,
- *stationary phase:* appropriate molecular sieve for chromatography (0.5 nm).

Carrier gas: *helium for chromatography R*.

Flow rate: 40 ml/min.

Temperature:

- *column:* 50 °C,
- *detector:* 130 °C.

Detection: thermal conductivity.

System suitability: reference gas (a): adjust the injected volumes and operating conditions so that the height of the peak due to nitrogen in the chromatogram obtained is at least 35 per cent of the full scale of the recorder:

- the chromatogram obtained shows a clear separation of oxygen and nitrogen.

Limit:

- *total:* not more than 0.5 per cent of the sum of the areas of all the peaks (0.5 per cent V/V).

IDENTIFICATION

First identification: A.

Second identification: B, C.

- A. Examine the chromatograms obtained in the test for impurities (see Production).

Results: the principal peak in the chromatogram obtained with the gas to be examined is similar in retention time to the principal peak in the chromatogram obtained with reference gas (b).

- B. In a 250 ml conical flask replace the air by the gas to be examined. Place a burning or glowing splinter of wood in the flask. The splinter is extinguished.
- C. In a suitable test tube, place 0.1 g of *magnesium R* in turnings. Close the tube with a two-hole stopper fitted with a glass tube reaching about 1 cm above the turnings. Pass the gas to be examined through the glass tube for 1 min without heating, then for 15 min while heating the test tube to a red glow. After cooling, add 5 ml of *dilute sodium hydroxide solution R*. The evolving vapours turn the colour of moistened *red litmus paper R* blue.

STORAGE

Where the gas has to be stored, store as a compressed gas or a liquid in appropriate containers complying with the legal regulations.

IMPURITIES

- A. oxygen,
- B. argon.

01/2005:0416

NITROUS OXIDE

Dinitrogenii oxidum

N₂OM_r 44.01

DEFINITION

Content: minimum 98.0 per cent V/V of N₂O in the gaseous phase, when sampled at 15 °C.

This monograph applies to nitrous oxide for medicinal use.

CHARACTERS

Appearance: colourless gas.

Solubility: at 20 °C and at a pressure of 101 kPa, 1 volume dissolves in about 1.5 volumes of water.

PRODUCTION

Nitrous oxide is produced from ammonium nitrate by thermic decomposition.

Examine the gaseous phase.

If the test is performed on a cylinder, keep the cylinder at room temperature for at least 6 h before carrying out the tests. Keep the cylinder in the vertical position with the outlet valve uppermost.

Carbon dioxide. Gas chromatography (2.2.28).

Gas to be examined. The substance to be examined.

Reference gas. A mixture containing 300 ppm V/V of carbon dioxide R1 in nitrous oxide R.

Column:

- **material:** stainless steel,
- **size:** $l = 3.5$ m, $\varnothing = 2$ mm,
- **stationary phase:** ethylvinylbenzene-divinylbenzene copolymer R.

Carrier gas: helium for chromatography R.

Flow rate: 15 ml/min.

Temperature:

- **column:** 40 °C,
- **detector:** 90 °C.

Detection: thermal conductivity.

Injection: loop injector.

Adjust the injected volumes and operating conditions so that the height of the peak due to carbon dioxide in the chromatogram obtained with the reference gas is at least 35 per cent of the full scale of the recorder. The test is not valid unless the chromatograms obtained show a clear separation of carbon dioxide from nitrous oxide.

Limit:

- **carbon dioxide:** not more than the area of the corresponding peak in the chromatogram obtained with the reference gas (300 ppm V/V).

Carbon monoxide. Gas chromatography (2.2.28). *When the test is carried out on a cylinder, use the first portion of gas to be withdrawn.*

Gas to be examined. The substance to be examined.

Reference gas. A mixture containing 5 ppm V/V of carbon monoxide R in nitrous oxide R.

Column:

- **material:** stainless steel,
- **size:** $l = 2$ m, $\varnothing = 4$ mm,
- **stationary phase:** suitable molecular sieve for chromatography (0.5 nm).

Carrier gas: helium for chromatography R.

Flow rate: 60 ml/min.

Temperature:

- **column:** 50 °C,
- **injection port and detector:** 130 °C.

Detection: flame ionisation with methaniser.

Injection: loop injector.

Adjust the injected volumes and the operating conditions so that the height of the peak due to carbon monoxide in the chromatogram obtained with the reference gas is at least 35 per cent of the full scale of the recorder.

Limit:

- **carbon monoxide:** not more than the area of the corresponding peak in the chromatogram obtained with the reference gas (5 ppm V/V).

Nitrogen monoxide and nitrogen dioxide: maximum

2 ppm V/V in total in the gaseous and liquid phases, determined using a chemiluminescence analyser (2.5.26).

Gas to be examined. The substance to be examined.

Reference gas (a). Nitrous oxide R.

Reference gas (b). A mixture containing 2 ppm V/V of nitrogen monoxide R in nitrogen R1.

Calibrate the apparatus and set the sensitivity using reference gases (a) and (b). Measure the content of nitrogen monoxide and nitrogen dioxide, separately examining the samples collected from the gaseous phase and the liquid phase of the gas to be examined.

Multiply the result obtained by the quenching correction factor in order to correct the quenching effect on the analyser response caused by the nitrous oxide matrix effect.

The quenching correction factor is determined by applying a known reference mixture of nitrogen monoxide in nitrous oxide and comparing the actual content with the content indicated by the analyser which has been calibrated with a NO/N₂ reference mixture.

$$\text{Quenching correction factor} = \frac{\text{actual nitrogen monoxide content}}{\text{indicated nitrogen monoxide content}}$$

Water: maximum 67 ppm V/V, determined using an electrolytic hygrometer (2.5.28).

Assay. Gas chromatography (2.2.28).

Gas to be examined. The substance to be examined.

Reference gas. Nitrous oxide R.

Column:

- **material:** stainless steel,
- **size:** $l = 2$ m, $\varnothing = 2$ mm,
- **stationary phase:** silica gel for chromatography R (250-355 μm).

Carrier gas: helium for chromatography R.

Flow rate: 50 ml/min.

Temperature:

- **column and injection port:** 60 °C,

– detector: 130 °C.

Detection: thermal conductivity.

Injection: loop injector.

Adjust the injected volumes and the operating conditions so that the height of the peak due to nitrous oxide in the chromatogram obtained with the reference gas is at least 35 per cent of the full scale of the recorder.

The area of the peak due to nitrous oxide in the chromatogram obtained with the gas to be examined is at least 98.0 per cent of the area of the peak due to nitrous oxide in the chromatogram obtained with the reference gas.

IDENTIFICATION

First identification: A.

Second identification: B, C.

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of nitrous oxide.

B. Place a glowing splinter of wood in the substance to be examined. The splinter bursts into flame.

C. Introduce the substance to be examined into *alkaline pyrogallol solution R*. A brown colour does not develop.

TESTS

Examine the gaseous phase.

If the test is performed on a cylinder, keep the cylinder of the substance to be examined at room temperature for at least 6 h before carrying out the tests. Keep the cylinder in the vertical position with the outlet valve uppermost.

Carbon dioxide: maximum 300 ppm V/V, determined using a carbon dioxide detector tube (2.1.6).

Carbon monoxide: maximum 5 ppm V/V, determined using a carbon monoxide detector tube (2.1.6). When the test is carried out on a cylinder, use the first portion of the gas to be withdrawn.

Nitrogen monoxide and nitrogen dioxide: maximum 2 ppm V/V, determined using a nitrogen monoxide and nitrogen dioxide detector tube (2.1.6).

Water vapour: maximum 67 ppm V/V, determined using a water vapour detector tube (2.1.6).

STORAGE

Store liquefied under pressure in suitable containers complying with the legal regulations. The taps and valves are not greased or oiled.

IMPURITIES

A. carbon dioxide,

B. carbon monoxide,

C. nitrogen monoxide,

D. nitrogen dioxide,

E. water.

NIZATIDINE

Nizatidinum

$C_{12}H_{21}N_5O_2S_2$

M_r 331.5

DEFINITION

Nizatidine contains not less than 97.0 per cent and not more than the equivalent of 101.0 per cent of (EZ)-N-[2-[[[2-[(dimethylamino)methyl]thiazol-4-yl]methyl]sulphanyl]ethyl]-N'-methyl-2-nitroethene-1,1-diamine, calculated with reference to the dried substance.

CHARACTERS

An almost white or slightly brownish, crystalline powder, sparingly soluble in water, soluble in methanol.

IDENTIFICATION

First identification: C.

Second identification: A, B, D.

A. Melting point (2.2.14): 131 °C to 134 °C.

B. Dissolve 0.10 g of the substance to be examined in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml of the solution to 100.0 ml with *methanol R*. Examined between 220 nm and 350 nm (2.2.25), the solution shows two absorption maxima, at 242 nm and 325 nm. The ratio of the absorbance measured at the maximum at 325 nm to that measured at the maximum at 242 nm is 2.2 to 2.5.

C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *nizatidine CRS*. Examine the substance prepared as discs.

D. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution. Dissolve 50 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 50 mg of *nizatidine CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 50 mg of *nizatidine CRS* and 50 mg of *ranitidine hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Apply to the plate 5 µl of each solution. Develop over a path corresponding to two thirds of the height of the plate using a mixture of 2 volumes of *water R*, 4 volumes of *concentrated ammonia R1*, 15 volumes of *2-propanol R* and 25 volumes of *ethyl acetate R*. Allow the plate to dry in air and expose to iodine vapour until the spots are clearly visible. Examine in daylight. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

TESTS

Appearance of solution. Dissolve 0.2 g of the substance to be examined in a 10 g/l solution of *hydrochloric acid R* and dilute to 20 ml with the same acid solution. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₅ (2.2.2, *Method II*).

pH (2.2.3). Dissolve 0.2 g of the substance to be examined in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent. The pH of the solution is 8.5 to 10.0.

Related substances. Examine by liquid chromatography (2.2.29) as described under Assay, replacing the mixture of mobile phases by the following elution programme:

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 3	76	24	isocratic
3 - 20	76 → 50	24 → 50	linear gradient
20 - 45	50	50	isocratic
45 - 50	50 → 76	50 → 24	linear gradient
50 - 60	76	24	re-equilibration

Inject 20 µl of reference solution (a). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with the reference solution is at least 50 per cent of the full scale of the recorder. The test is not valid unless the retention time of nizatidine is between 10 min and 20 min and the symmetry factor of the peak due to nizatidine is not greater than 2.0. Inject 20 µl of reference solution (c). The test is not valid unless the resolution between the peak due to nizatidine (first peak) and impurity F (second peak) is at least 2.0.

Inject 20 µl of test solution (a). In the chromatogram obtained, the area of any peak apart from the principal peak, is not greater than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent) and the sum of the areas of all these peaks is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent). Disregard any peak with an area less than 0.03 times the area of the principal peak in the chromatogram obtained with reference solution (a).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) *R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution (a). Dissolve 50.0 mg of the substance to be examined in a mixture of 24 volumes of mobile phase B and 76 volumes of mobile phase A and dilute to 10.0 ml with the same mixture of mobile phases.

Test solution (b). Dissolve 15.0 mg of the substance to be examined in a mixture of 24 volumes of mobile phase B and 76 volumes of mobile phase A and dilute to 50.0 ml with the same mixture of mobile phases.

Reference solution (a). Dilute 1.0 ml of test solution (a) to 100.0 ml with a mixture of 24 volumes of mobile phase B and 76 volumes of mobile phase A.

Reference solution (b). Dissolve 15.0 mg of *nizatidine CRS* in a mixture of 24 volumes of mobile phase B and 76 volumes of mobile phase A and dilute to 50.0 ml with the same mixture of mobile phases.

Reference solution (c). Dissolve 5 mg of *nizatidine CRS* and 0.5 mg of *nizatidine impurity F CRS* in a mixture of 24 volumes of mobile phase B and 76 volumes of mobile phase A and dilute to 100.0 ml with the same mixture of mobile phases.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.0 ml/min a mixture of 35 volumes of mobile phase B and 65 volumes of mobile phase A:

Mobile phase A. Dissolve 5.9 g of *ammonium acetate R* in 760 ml of *water R*, add 1 ml of *diethylamine R*, and adjust the pH to 7.5 with *acetic acid R*,

Mobile phase B. Methanol R,

- as detector a spectrophotometer set at 254 nm.

Inject 20 µl of reference solution (b). The test is not valid unless the retention time of nizatidine is between 8 min and 10 min and the symmetry of the peak due to nizatidine is not greater than 2.0.

Inject reference solution (b) six times. The test is not valid unless the relative standard deviation of the peak area for nizatidine is at most 2.0 per cent.

Inject 20 µl of test solution (b) and 20 µl of reference solution (b). Calculate the percentage content of nizatidine from the areas of the peaks and the declared content of *nizatidine CRS*.

IMPURITIES

A. X = NH: *N,N'*-dimethyl-2-nitroethene-1,1-diamine,

B. X = S: (*EZ*)-*N*-methyl-1-(methylsulphonyl)-2-nitroethen-1-amine,

C. (*EZ*)-*N*-[2-[[2-[(dimethylamino)methyl]thiazol-4-yl]methyl]sulphonyl]ethyl]-*N'*-methyl-2-nitroethene-1,1-diamine,

- D. $R = S-CH_2-CH_2-NH_2$: 2-[[2-[(dimethylamino)methyl]thiazol-4-yl]methyl]sulphanyl]ethanamine,
- E. $R = S-CH_2-CH_2-NH-CO-CH_2-NO_2$: *N*-[2-[[2-[(dimethylamino)methyl]thiazol-4-yl]methyl]sulphanyl]ethyl]-2-nitroacetamide,
- I. $R = S-CH_2-CH_2-NH-CO-NH-CH_3$: *N*-[2-[[2-[(dimethylamino)methyl]thiazol-4-yl]methyl]sulphanyl]ethyl]-*N'*-methylurea,
- J. $R = OH$: [2-[(dimethylamino)methyl]thiazol-4-yl]methanol,

- F. (*EZ*)-*N*¹,*N*^{1'}-[thiazole-2,4-diylbis(methylenesulphanediyl-ethylene)]bis(*N'*-methyl-2-nitroethene-1,1-diamine),

- G. *N,N'*-bis[2-[[2-[(dimethylamino)methyl]thiazol-4-yl]methyl]sulphanyl]ethyl]-2-nitroethene-1,1-diamine,

- H. 2-(dimethylamino)thioacetamide,

- K. 3-(methylamino)-5,6-dihydro-2*H*-1,4-thiazin-2-one oxime.

DEFINITION

Nomegestrol acetate contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of 6-methyl-3,20-dioxo-19-norpregna-4,6-dien-17-yl acetate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, freely soluble in acetone, soluble in alcohol.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *nomegestrol acetate CRS*.

TESTS

Appearance of solution. Dissolve 1.0 g in *methylene chloride R* and dilute to 10 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₅ (2.2.2, *Method II*).

Specific optical rotation (2.2.7). Dissolve 0.500 g in *ethanol R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is -60.0 to -64.0 , calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in *methanol R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Reference solution (b). Dissolve 25.0 mg of *nomegestrol acetate impurity A CRS* in *methanol R* and dilute to 50.0 ml with the same solvent.

Reference solution (c). Dissolve 25.0 mg of *nomegestrol acetate CRS* in 20 ml of *methanol R*, add 0.25 ml of reference solution (b) and dilute to 50.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 μ m),
- as mobile phase at a flow rate of 1.3 ml/min a mixture of 24 volumes of *acetonitrile R*, 38 volumes of *methanol R* and 38 volumes of *water R*,
- as detector, a variable wavelength spectrophotometer capable of operating at 245 nm and at 290 nm.

Inject 10 μ l of reference solution (c) and record the chromatogram with the detector set at 245 nm.

When the chromatogram is recorded in the prescribed conditions, the retention times are: nomegestrol acetate about 17 min and impurity A about 18.5 min. Adjust the sensitivity of the system at 245 nm so that the height of the peak due to impurity A in the chromatogram obtained with reference solution (c) is at least 50 per cent of the full scale of the recorder.

Measure the height H_p above the baseline of the peak due to impurity A and the height H_r above the baseline of the lowest point of the curve separating this peak from the peak due to nomegestrol acetate. The test is not valid unless H_p is greater than 5 times H_r .

Inject 10 μ l of reference solution (a) and record the chromatogram with the detector set at 290 nm. Adjust the sensitivity of the system at 290 nm so that the height of the

01/2005:1551

NOMEGESTROL ACETATE

Nomegestroli acetat

C₂₃H₃₀O₄M_r 370.5

principal peak in the chromatogram obtained with reference solution (a) is at least 50 per cent of the full scale of the recorder.

Inject 10 µl of the test solution and record the chromatograms at 245 nm and 290 nm for 1.5 times the retention time of the principal peak.

In the chromatogram obtained with the test solution at 290 nm: the area of any peak, apart from the principal peak, is not greater than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). Disregard any peak with an area less than 0.04 times that of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent). In the chromatogram obtained with the test solution at 245 nm: the area of any peak corresponding to impurity A is not greater than 0.4 times the area of the peak due to impurity A in the chromatogram obtained with reference solution (c) (0.2 per cent); the area of any peak, apart from the principal peak and any peak corresponding to impurity A, is not greater than 0.2 times the area of the peak due to impurity A in the chromatogram obtained with reference solution (c) (0.1 per cent). Disregard any peak with an area less than 0.1 times that of the peak due to impurity A in the chromatogram obtained with reference solution (c) (0.05 per cent).

In the chromatograms obtained at 290 nm and 245 nm, the sum of the related substances apart from impurity A is not greater than 0.3 per cent.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C.

ASSAY

Dissolve 50.0 mg in *ethanol R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml of the solution to 100.0 ml with *ethanol R*. Measure the absorbance (2.2.25) at the maximum at 287 nm.

Calculate the content of $C_{23}H_{30}O_4$ taking the specific absorbance to be 685.

STORAGE

Store protected from light.

IMPURITIES

A. 6α-methyl-3,20-dioxo-19-norpregn-4-en-17-yl acetate.

01/2005:1454

NONOXINOL 9

Nonoxinolum 9

DEFINITION

α-(4-Nonylphenyl)-ω-hydroxynona(oxyethylene).

Mixture consisting mainly of monononylphenyl ethers of macrogols corresponding to the formula: $C_9H_{19}C_6H_4-[OCH_2CH_2]_n-OH$ where the average value of n is 9. It may contain free macrogols.

CHARACTERS

Appearance: clear, colourless or light yellow, viscous liquid.

Solubility: miscible with water, with alcohol and with vegetable oils.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: *Ph. Eur. reference spectrum of nonoxinol 9.*

Preparation: film between *sodium chloride R* plates.

B. It complies with the test for cloud point (see Tests).

TESTS

Acidity or alkalinity. Boil 1.0 g with 20 ml of *carbon dioxide-free water R* for 1 min, with constant stirring. Cool and filter. To 10 ml of the filtrate, add 0.05 ml of *bromothymol blue solution R1*. Not more than 0.5 ml of 0.01 M *hydrochloric acid* or 0.01 M *sodium hydroxide* is required to change the colour of the indicator.

Hydroxyl value (2.5.3, *Method A*): 84 to 94.

Cloud point: 52 °C to 58 °C.

Dissolve 1.0 g in 99 g of *water R*. Transfer about 30 ml of this solution into a test-tube, heat on a water-bath and stir continuously until the solution becomes cloudy. Remove the test-tube from the water-bath (ensuring that the temperature does not increase more than 2 °C) and continue to stir. The cloud point is the temperature at which the solution becomes sufficiently clear that the entire thermometer bulb is plainly seen.

Ethylene oxide and dioxan (2.4.25): maximum 1 ppm of ethylene oxide and maximum 10 ppm of dioxan.

Heavy metals (2.4.8): maximum 10 ppm.

Dissolve 2.0 g in *distilled water R* and dilute to 20.0 ml with the same solvent. 12 ml of this solution complies with limit test A. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Water (2.5.12): maximum 0.5 per cent, determined on 2.00 g.

Total ash (2.4.16): maximum 0.4 per cent, determined on 1.0 g.

STORAGE

In an airtight container.

NORADRENALINE HYDROCHLORIDE

Noradrenalini hydrochloridum

$C_8H_{12}ClNO_3$

M_r 205.6

DEFINITION

(*R*)-2-Amino-1-(3,4-dihydroxyphenyl)ethanol hydrochloride.

Content: 98.5 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or brownish-white, crystalline powder.

Solubility: very soluble in water, slightly soluble in alcohol. It becomes coloured on exposure to air and light.

IDENTIFICATION

- A. Specific optical rotation (see Tests).
 B. Infrared absorption spectrophotometry (2.2.24).

Dissolve 2 g in 20 ml of a 5 g/l solution of *sodium metabisulphite R* and make alkaline by addition of *ammonia R*. Keep in iced water for 1 h and filter. Wash the precipitate with 3 quantities, each of 2 ml, of *water R*, with 5 ml of *alcohol R* and finally with 5 ml of *ether R* and dry *in vacuo* for 3 h. Examine the noradrenaline base thus prepared, comparing with the spectrum obtained with noradrenaline base prepared by the same method from a suitable amount of *noradrenaline tartrate CRS*. Examine the substances prepared as discs.

- C. 0.2 ml of solution S (see Tests) gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 0.500 g in *carbon dioxide-free water R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. The solution is clear (2.2.1) and not more intensely coloured than a mixture of 0.2 ml of blue primary solution, 0.4 ml of yellow primary solution, 0.4 ml of red primary solution and 9 ml of a 13.7 per cent V/V solution of *dilute hydrochloric acid R* (2.2.2, Method II).

Dissolve 0.2 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent. Examine the solution immediately.

pH (2.2.3): 3.5 to 4.5 for solution S.

Specific optical rotation (2.2.7): –37 to –41, determined on solution S (anhydrous substance).

Noradrenalone: maximum 0.12 per cent.

Dissolve 30.0 mg in 0.01 M *hydrochloric acid* and dilute to 25.0 ml with the same acid. The absorbance (2.2.25) of the solution measured at 310 nm is not greater than 0.20.

Adrenaline. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 0.15 g of the substance to be examined in *water R* and dilute to 10 ml with the same solvent. Prepare immediately before use.

Reference solution (a). Dissolve 12.5 mg of *adrenaline tartrate CRS* in *water R* and dilute to 10 ml with the same solvent. Prepare immediately before use.

Reference solution (b). Dilute 2 ml of reference solution (a) to 10 ml with *water R*.

Reference solution (c). Mix 2 ml of the test solution and 2 ml of reference solution (b).

Plate: TLC silica gel G plate R.

Mobile phase: *anhydrous formic acid R*, *acetone R*, *methylene chloride R* (0.5:50:50 V/V/V).

Application: apply as bands 20 mm by 2 mm, 6 µl of the test solution, 6 µl of reference solution (a), 6 µl of reference solution (b) and 12 µl of reference solution (c). Allow to dry in air and spray the bands with a saturated solution of *sodium hydrogen carbonate R*. Allow the plate to dry in air and spray the bands twice with *acetic anhydride R*, drying between the 2 sprayings. Heat the plate at 50 °C for 90 min.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with a solution freshly prepared by mixing 2 volumes of *ethylenediamine R* and 8 volumes of *methanol R* and adding 2 volumes of a 5 g/l solution of *potassium ferricyanide R*. Dry the plate at 60 °C for 10 min and examine in ultraviolet light at 254 nm and 365 nm.

System suitability: the chromatogram obtained with reference solution (c) shows above the most intense zone a clearly separated zone corresponding to the most intense zone in the chromatogram obtained with reference solution (a).

Limits: any zone situated immediately above the most intense zone is not more intense than the corresponding zone in the chromatogram obtained with reference solution (b) (1.0 per cent).

Water (2.5.12): maximum 0.5 per cent, determined on 1.000 g.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 0.50 g.

ASSAY

Dissolve 0.180 g in 50 ml of *acetic anhydride R* and add 10 ml of *anhydrous formic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20). 1 ml of 0.1 M *perchloric acid* is equivalent to 20.56 mg of C₈H₁₂ClNO₃.

STORAGE

Store in an airtight container, or preferably in a sealed tube under vacuum or under an inert gas, protected from light.

01/2005:0285

NORADRENALINE TARTRATE

Noradrenalini tartras

C₁₂H₁₇NO₉·H₂OM_r 337.3

DEFINITION

(1R)-2-Amino-1-(3,4-dihydroxyphenyl)ethanol hydrogen (2R,3R)-2,3-dihydroxybutanedioate monohydrate.

Content: 98.5 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water, slightly soluble in alcohol.

IDENTIFICATION

- A. Dissolve 2 g in 20 ml of a 5 g/l solution of *sodium metabisulphite R* and make alkaline by addition of *ammonia R*. Keep in iced water for 1 h and filter. Reserve the filtrate for identification test C. Wash the precipitate with 3 quantities, each of 2 ml, of *water R*, with 5 ml of *alcohol R* and finally with 5 ml of *ether R* and dry *in vacuo* for 3 h. The specific optical rotation (2.2.7) of the precipitate (noradrenaline base) is –44 to –48, determined using a 20.0 g/l solution in 0.5 M *hydrochloric acid*.
- B. Infrared absorption spectrophotometry (2.2.24).
 Use noradrenaline base prepared as described under identification test A and compare with the spectrum obtained with noradrenaline base prepared by the same method from a suitable amount of *noradrenaline tartrate CRS*. Examine the substances prepared as discs.
- C. 0.2 ml of the filtrate obtained in identification test A gives reaction (b) of tartrates (2.3.1).

TESTS

01/2005:0234

Appearance of solution. The solution is clear (2.2.1) and not more intensely coloured than reference solution BY₅ (2.2.2, Method II).

Dissolve 0.2 g in *water R* and dilute to 10 ml with the same solvent. Examine the solution immediately.

Noradrenalone: the absorbance (2.2.25) of the solution measured at 310 nm is not greater than 0.20.

Dissolve 50.0 mg in 0.01 M hydrochloric acid and dilute to 25.0 ml with the same acid.

Adrenaline. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 0.25 g of the substance to be examined in *water R* and dilute to 10 ml with the same solvent. Prepare immediately before use.

Reference solution (a). Dissolve 12.5 mg of *adrenaline tartrate CRS* in *water R* and dilute to 10 ml with the same solvent. Prepare immediately before use.

Reference solution (b). Dilute 2 ml of reference solution (a) to 10 ml with *water R*.

Reference solution (c). Mix 2 ml of the test solution with 2 ml of reference solution (b).

Plate: TLC silica gel G plate *R*.

Mobile phase: anhydrous formic acid *R*, acetone *R*, methylene chloride *R* (0.5:50:50 V/V/V).

Application: apply as bands 20 mm by 2 mm, 6 µl of the test solution, 6 µl of reference solution (a), 6 µl of reference solution (b) and 12 µl of reference solution (c). Allow to dry in air and spray the bands with a saturated solution of sodium hydrogen carbonate *R*. Allow the plate to dry in air and spray the bands twice with acetic anhydride *R*, drying between the 2 sprayings. Heat the plate at 50 °C for 90 min.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with a solution freshly prepared by mixing 2 volumes of ethylenediamine *R* and 8 volumes of methanol *R* and adding 2 volumes of a 5 g/l solution of potassium ferricyanide *R*. Dry the plate at 60 °C for 10 min and examine in ultraviolet light at 254 nm and 365 nm.

System suitability: the chromatogram obtained with reference solution (c) shows above the most intense zone a clearly separated zone corresponding to the most intense zone in the chromatogram obtained with reference solution (a).

Limit:

- *adrenaline:* any zone situated immediately above the most intense zone is not more intense than the corresponding zone in the chromatogram obtained with reference solution (b) (1.0 per cent).

Water (2.5.12): 4.5 per cent to 5.8 per cent, determined on 0.500 g.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 0.5 g.

ASSAY

Dissolve 0.300 g in 50 ml of anhydrous acetic acid *R*, heating gently if necessary. Titrate with 0.1 M perchloric acid using 0.1 ml of crystal violet solution *R* as indicator, until a bluish-green colour is obtained.

1 ml of 0.1 M perchloric acid is equivalent to 31.93 mg of C₁₂H₁₇NO₉.

STORAGE

In an airtight container, or preferably in a sealed tube under vacuum or under an inert gas, protected from light.

NORETHISTERONE

Norethisteronum

C₂₀H₂₆O₂M_r 298.4

DEFINITION

Norethisterone contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of 17-hydroxy-19-nor-17α-pregn-4-en-20-yn-3-one, calculated with reference to the dried substance.

CHARACTERS

A white or yellowish-white, crystalline powder, practically insoluble in water, slightly soluble in alcohol.

It melts at about 206 °C, with decomposition.

IDENTIFICATION

First identification: A, B, E.

Second identification: B, C, D, E.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *norethisterone CRS*. Examine the substances prepared in the form of discs. If the spectra obtained with the substance to be examined and the reference substance show differences, dissolve the substances in *chloroform R*, evaporate to dryness on a water-bath and then record the spectra.
- Examine by thin-layer chromatography (2.2.27), using *kieselguhr G R* as the coating substance. Impregnate the plate by placing it in a tank containing the necessary quantity of a mixture of 10 volumes of *formamide R* and 90 volumes of *acetone R* so that the plate dips about 5 mm into the liquid. When the front of the impregnation mixture has risen at least 1 cm above the level prescribed for the mobile phase, remove the plate and allow it to stand at room temperature until the solvent has completely evaporated (about 2 min to 5 min). Use the impregnated plate within 2 h and carry out the chromatography in the same direction as the impregnation.

Test solution. Dissolve 10 mg of the substance to be examined in *chloroform R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 10 mg of *norethisterone CRS* in *chloroform R* and dilute to 10 ml with the same solvent.

Apply separately to the plate 2 µl of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of *dioxan R* and 80 volumes of *hexane R*. Heat the plate at 120 °C for 15 min and spray with *alcoholic solution of sulphuric acid R*. Heat at 120 °C for 10 min to 15 min or until the spots appear. Allow to cool and examine in daylight and in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution is similar in position, colour, fluorescence and size to the principal spot in the chromatogram obtained with the reference solution.

- C. Dissolve about 2 mg in 2 ml of *alcohol R*, add 1 ml of *ammoniacal silver nitrate solution R* and heat on a water-bath. The solution becomes turbid and a white precipitate is formed which becomes grey when heated. A silver mirror is deposited on the walls of the tube.
- D. Dissolve about 2 mg in a cooled mixture of 2 ml of *ethanol R* and 2 ml of *sulphuric acid R* and heat to 70 °C. The resulting solution is dichroic, appearing blue-violet in transmitted light and red in reflected light. The solution shows a bright-red fluorescence in ultraviolet light at 365 nm.
- E. Dissolve about 2 mg in 2 ml of *alcohol R*, add 1 ml of a 10 g/l solution of *butylhydroxytoluene R* in *alcohol R* and 2 ml of 1 M *sodium hydroxide*. Heat in a water-bath at 80 °C for 30 min and cool to room temperature. A yellowish-pink colour is produced.

TESTS

Solution S. Dissolve 0.200 g in *dioxan R* and dilute to 10.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, Method I).

Specific optical rotation (2.2.7). Dilute 5.0 ml of solution S to 10.0 ml with *dioxan R*. The specific optical rotation is –33 to –37, calculated with reference to the dried substance.

Absorbance (2.2.25). Dissolve 10.0 mg in *alcohol R* and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml of this solution to 100.0 ml with *alcohol R*. The solution shows an absorption maximum at 240 nm. The specific absorbance at the maximum is 550 to 590, calculated with reference to the dried substance.

Related substances. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution. Dissolve 50 mg of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *chloroform R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dilute 1.0 ml of the test solution to 200 ml with a mixture of 1 volume of *methanol R* and 9 volumes of *chloroform R*.

Reference solution (b). Dissolve 25 mg of *ethisterone CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *chloroform R*, add 5 ml of the test solution and dilute to 100 ml with the same mixture of solvents.

Apply separately to the plate, as two applications of 5 µl, 10 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *acetone R* and 90 volumes of *chloroform R*. Allow the plate to dry in air, spray with *alcoholic solution of sulphuric acid R* and heat at 100 °C to 105 °C for 5 min. Examine in ultraviolet light at 365 nm.

Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots of approximately equal intensity.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.00 g by drying in an oven at 100 °C to 105 °C for 3 h.

ASSAY

Dissolve 0.200 g in 40 ml of *tetrahydrofuran R*. Add 10 ml of a 100 g/l solution of *silver nitrate R*. Using 2 ml of *bromocresol green solution R* as indicator, titrate with 0.1 M *sodium hydroxide* until a violet colour is obtained. Carry out a blank titration.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 29.84 mg of C₂₀H₂₆O₂.

STORAGE

Store protected from light.

01/2005:0850

NORETHISTERONE ACETATE

Norethisteroni acetat

C₂₂H₂₈O₃M_r 340.5

DEFINITION

3-Oxo-19-nor-17α-pregn-4-en-20-yn-17-yl acetate.

Content: 98.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or yellowish-white, crystalline powder.

Solubility: practically insoluble in water, freely soluble in methylene chloride, soluble in alcohol.

It shows polymorphism.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: *norethisterone acetate CRS*.

If the spectra show differences, dissolve the substance to be examined and the reference substance separately in *methylene chloride R*, evaporate to dryness on a water-bath and record new spectra using the residues.

TESTS

Specific optical rotation (2.2.7) –30 to –35 (dried substance).

Dissolve 0.500 g in *ethanol R* and dilute to 25.0 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 2 mg of *desoxycortone acetate CRS* and 2 mg of *norethisterone acetate CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Column:

- size: *l* = 0.25 m, Ø = 4.6 mm,
- stationary phase: octadecylsilyl silica gel for chromatography R (5 µm).

Mobile phase: acetonitrile *R*, water *R* (60:40 *V/V*).

Flow rate: 1.0 ml/min.

Detection: variable wavelength spectrophotometer capable of operating at 254 nm and at 210 nm.

Injection: 20 µl.

Run time: 3 times the retention time of norethisterone acetate.

Relative retention with reference to norethisterone acetate (retention time = about 10 min): impurity A = about 0.48; impurity D = about 0.65; impurity E = about 0.83; impurity C = about 1.35; impurity B = about 1.40.

System suitability: reference solution (a) at 254 nm:

- resolution: minimum of 3.5 between the peaks due to norethisterone acetate and to desoxycortone acetate.

Limits: spectrophotometer at 254 nm:

- any impurity: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
- total: not more than 0.75 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.75 per cent),
- disregard limit: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Limits: spectrophotometer at 210 nm:

- any impurity with a relative retention between 1.0 and 1.6, with reference to norethisterone acetate (retention time = about 10 min): not more than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent),
- total of these impurities: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
- disregard limit: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

ASSAY

Dissolve 0.200 g in 40 ml of *tetrahydrofuran R*. Add 10 ml of a 100 g/l solution of *silver nitrate R* and titrate with 0.1 *M* sodium hydroxide, determining the end-point potentiometrically (2.2.20). Carry out a blank titration.

1 ml of 0.1 *M* sodium hydroxide is equivalent to 34.05 mg of $C_{22}H_{28}O_3$.

IMPURITIES

Specified impurities: A, B, C, D, E.

Other detectable impurities: F, G.

A. norethisterone,

B. 3-oxo-19-nor-17 α -pregn-5(10)-en-20-yn-17-yl acetate,

C. 3-oxo-19-nor-17 α -pregn-5-en-20-yn-17-yl acetate,

D. R1 = H, R2 = CO-CH₃, R3 = C $\equiv$ CH: 6 β -acetyl-3-oxo-19-nor-17 α -pregn-4-en-20-yn-17-yl acetate,

E. R1 = R2 = H, R3 = CO-CH₃: 3,20-dioxo-19-nor-17 α -pregn-4-en-17-yl acetate,

F. R1 = H, R2 = OH, R3 = C $\equiv$ CH: 6 β -hydroxy-3-oxo-19-nor-17 α -pregn-4-en-20-yn-17-yl acetate,

G. R1 + R2 = O, R3 = C $\equiv$ CH: 3,6-dioxo-19-nor-17 α -pregn-4-en-20-yn-17-yl acetate.

01/2005:1248

NORFLOXACIN

Norfloxacinum

$C_{16}H_{18}FN_3O_3$

M_r 319.3

DEFINITION

Norfloxacin contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 1-ethyl-6-fluoro-4-oxo-7-(piperazin-1-yl)-1,4-dihydroquinoline-3-carboxylic acid, calculated with reference to the dried substance.

CHARACTERS

A white or pale-yellow, hygroscopic, photosensitive, crystalline powder, very slightly soluble in water, slightly soluble in acetone and in alcohol.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *norfloxacin CRS*. Examine the substances prepared as discs.

TESTS

Appearance of solution. Dissolve 0.5 g in a previously filtered 4 g/l solution of *sodium hydroxide R* in *methanol R* and dilute to 50 ml with the same solution. The solution is not more opalescent than reference suspension II (2.2.1) and not more intensely coloured than reference solution B₇ (2.2.2, *Method II*).

01/2005:0940

Related substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel GF₂₅₄* plate *R*, previously washed with *methanol R* and dried in air.

Test solution (a). Dissolve 40 mg of the substance to be examined in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 5 ml with the same mixture of solvents.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with a mixture of equal volumes of *methanol R* and *methylene chloride R*.

Reference solution (a). Dilute 1 ml of test solution (b) to 50 ml with a mixture of equal volumes of *methanol R* and *methylene chloride R*.

Reference solution (b). Dissolve 4.0 mg of *norfloxacin impurity A CRS* in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 5 ml with the same mixture of solvents. Dilute 1 ml of this solution to 2 ml with test solution (b).

Apply to the plate 5 µl of test solution (a) and 5 µl of each reference solution. Develop over a path of 18 cm using a mixture of 8 volumes of *water R*, 14 volumes of *diethylamine R*, 20 volumes of *toluene R*, 40 volumes of *chloroform R* and 40 volumes of *methanol R*. Dry the plate in a current of air and examine in ultraviolet light at 254 nm and then 365 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the principal spot in the chromatogram obtained with reference solution (a) (0.2 per cent) and there are no more than three such spots. The test is not valid unless, in the chromatogram obtained with reference solution (b), the ratio of the *R_f* value of impurity A to the *R_f* value of norfloxacin is at least 1.2.

Heavy metals (2.4.8). 2.0 g complies with limit test D for heavy metals (15 ppm). Prepare the standard using 3 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven at 100-105 °C under high vacuum for 2 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Dissolve 0.240 g in 80 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 31.93 mg of C₁₆H₁₈FN₃O₃.

STORAGE

Store in an airtight container, protected from light.

IMPURITIES

A. R = Cl: 7-chloro-1-ethyl-6-fluoro-4-oxo-1,4-dihydroquinoline-3-carboxylic acid,

B. R = NH-CH₂-CH₂-NH₂: 7-[(2-aminoethyl)amino]-1-ethyl-6-fluoro-4-oxo-1,4-dihydroquinoline-3-carboxylic acid.

NORGESTREL

Norgestrelum

C₂₁H₂₈O₂*M_r* 312.5

DEFINITION

Norgestrel contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of *rac*-13-ethyl-17-hydroxy-18,19-dinor-17α-pregn-4-en-20-yn-3-one, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, sparingly soluble in methylene chloride, slightly soluble in alcohol.

IDENTIFICATION

- Dissolve 0.5 g in *methylene chloride R* and dilute to 10.0 ml with the same solvent. The angle of optical rotation (2.2.7) is + 0.05° to - 0.05°.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *norgestrel CRS*.

TESTS

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. Dissolve 0.2 g of the substance to be examined in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dilute 1 ml of the test solution to 10 ml with *methylene chloride R*. Dilute 1 ml of this solution to 20 ml with *methylene chloride R*.

Reference solution (b). Dilute 4 ml of reference solution (a) to 10 ml with *methylene chloride R*.

Reference solution (c). Dissolve 5 mg of *norgestrel CRS* and 5 mg of *ethinylestradiol CRS* in *methylene chloride R* and dilute to 50 ml with the same solvent.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of *ethyl acetate R* and 80 volumes of *methylene chloride R*. Allow the plate to dry in air, spray with a 100 g/l solution of *phosphomolybdic acid R* in *alcohol R*, heat at 100-105 °C for 15 min and examine immediately. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the principal spot in the chromatogram obtained with reference solution (a) (0.5 per cent) and at most two such spots are more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 45 ml of *tetrahydrofuran R*. Add 10 ml of a 100 g/l solution of *silver nitrate R*. After 1 min, titrate with 0.1 M *sodium hydroxide* determining the end-point potentiometrically (2.2.20). Carry out a blank titration. 1 ml of 0.1 M *sodium hydroxide* is equivalent to 31.25 mg of $C_{21}H_{28}O_2$.

STORAGE

Store protected from light.

01/2005:0941

NORTRIPTYLINE HYDROCHLORIDE

Nortriptylini hydrochloridum

 $C_{19}H_{22}ClN$ M_r 299.8

DEFINITION

Nortriptyline hydrochloride contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of 3-(10,11-dihydro-5H-dibenzo[a,d][7]annulen-5-ylidene)-N-methylpropan-1-amine hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, sparingly soluble in water, soluble in alcohol and in methylene chloride.

IDENTIFICATION

First identification: C, E.

Second identification: A, B, D, E.

- Melting point (2.2.14): 216 °C to 220 °C.
- Dissolve 20.0 mg in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of this solution to 100.0 ml with *methanol R*. Examined between 230 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 239 nm. The specific absorbance at the maximum is 465 to 495.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of nortriptyline hydrochloride*.
- Dissolve 50 mg in 3 ml of warm *water R*, cool and add 0.05 ml of a 25 g/l solution of *quinhydrone R* in *methanol R*. A red colour develops slowly.
- 50 mg gives reaction (b) of chlorides (2.3.1).

TESTS

Appearance of solution. Dissolve 0.5 g in *water R* with gentle heating and dilute to 25 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution B₇ (2.2.2, *Method II*).

Acidity or alkalinity. Dissolve 0.2 g with gentle heating in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent. Add 0.1 ml of *methyl red solution R* and 0.2 ml of 0.01 M *sodium hydroxide*. The solution is yellow. Add 0.4 ml of 0.01 M *hydrochloric acid*. The solution is red.

Related substances. Prepare the solutions in subdued light and develop the chromatograms protected from light. Examine by thin-layer chromatography (2.2.27), using a TLC silica gel plate R.

Test solution (a). Dissolve 0.20 g of the substance to be examined in *alcohol R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 2 ml with *alcohol R*.

Reference solution (a). Dissolve 10 mg of *dibenzosuberone CRS* in *alcohol R* and dilute to 10 ml with the same solvent. Dilute 1 ml of the solution to 100 ml with *alcohol R*.

Reference solution (b). Dissolve 10 mg of *norcyclobenzaprine CRS* in *alcohol R* and dilute to 10 ml with the same solvent. Dilute 1 ml of the solution to 100 ml with *alcohol R*.

Reference solution (c). To 0.1 ml of test solution (b) add 10 ml of reference solution (b).

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm in an unsaturated tank using a mixture of 3 volumes of *diethylamine R*, 15 volumes of *ethyl acetate R* and 85 volumes of *cyclohexane R*. Allow the plate to dry in air and spray with a freshly prepared mixture of 4 volumes of *formaldehyde solution R* and 96 volumes of *sulphuric acid R*. Examine immediately in ultraviolet light at 365 nm and then at 254 nm. In the chromatogram obtained with test solution (a): any spot corresponding to dibenzosuberone, is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.05 per cent); and any spot in the chromatogram obtained with test solution (b), apart from the principal spot and any spot corresponding to dibenzosuberone, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.1 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 2 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 30 ml of *alcohol R*. Add 1.0 ml of 0.1 M *hydrochloric acid*. Carry out a potentiometric titration (2.2.20), using 0.1 M *sodium hydroxide*. Read the volume added between the two points of inflexion.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 29.98 mg of $C_{19}H_{22}ClN$.

STORAGE

Store protected from light.

IMPURITIES

- A. 10,11-dihydro-5H-dibenzo[a,d][7]annulen-5-one (dibenzosuberone),

- B. 3-(5*H*-dibenzo[*a,d*][7]annulen-5-ylidene)-*N*-methylpropan-1-amine (norcyclobenzaprine),

- C. 10,11-dihydro-5-[3-(methylamino)propylidene]-5*H*-dibenzo[*a,d*][7]annulen-10-ol.

01/2005:0516

NOSCAPINE

Noscapinum

C₂₂H₂₃NO₇M_r 413.4

DEFINITION

(3*S*)-6,7-Dimethoxy-3-[(5*R*)-4-methoxy-6-methyl-5,6,7,8-tetrahydro-1,3-dioxolo[4,5-*g*]isoquinolin-5-yl]isobenzofuran-1(3*H*)-one.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white, crystalline powder or colourless crystals.

Solubility: practically insoluble in water, soluble in acetone, slightly soluble in alcohol. It dissolves in strong acids; on dilution of the solution with water, the base may be precipitated.

IDENTIFICATION

First identification: C, E.

Second identification: A, B, D, E.

- A. It complies with the test for specific optical rotation (see Tests).

- B. Melting point (2.2.14): 174 °C to 177 °C.

- C. Infrared absorption spectrophotometry (2.2.24).

Comparison: noscapine CRS.

- D. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 25 mg of the substance to be examined in *acetone R* and dilute to 100 ml with the same solvent.

Reference solution. Dissolve 25 mg of *noscapine CRS* in *acetone R* and dilute to 100 ml with the same solvent.

Plate: TLC silica gel plate *R*.

Mobile phase: concentrated ammonia *R*, alcohol *R*, acetone *R*, toluene *R* (1:3:20:20 V/V/V/V).

Application: 10 µl.

Development: over 2/3 of the plate.

Drying: in air.

Detection: spray with dilute potassium iodobismuthate solution *R*.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

- E. To 20 mg add 10 ml of *water R* and shake. It does not dissolve.

TESTS

Appearance of solution. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, Method II).

Dissolve 0.2 g in *acetone R* and dilute to 10 ml with the same solvent. Examine immediately after preparation.

Specific optical rotation (2.2.7): + 42 to + 48 (dried substance).

Dissolve 0.500 g in 0.1 *M* hydrochloric acid and dilute to 25.0 ml with the same acid.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 20.0 mg of the substance to be examined with gentle heating in 14 ml of *methanol R*, cool the solution and dilute to 20.0 ml with *phosphate buffer solution pH 6.0 R1*.

Reference solution (a). Dilute 1.0 ml of the test solution to 20.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of *papaverine hydrochloride R* in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

Reference solution (c). Dissolve 1.5 mg of *papaverine hydrochloride R* in 10 ml of the test solution and dilute to 50 ml with the mobile phase.

Column:

– *size*: *l* = 0.125 m, Ø = 4.6 mm,

– *stationary phase*: nitrile silica gel for chromatography *R* (5 µm).

Mobile phase: *methanol R*, *phosphate buffer solution pH 6.0 R1* (350:650 V/V).

Flow rate: 1 ml/min.

Detection: spectrophotometer at 240 nm.

Injection: 20 µl.

Run time: 2.5 times the retention time of noscapine.

Relative retention with reference to noscapine (retention time = about 10 min): impurity A = about 1.3.

System suitability: reference solution (c):

– *resolution*: minimum 2 between the peaks due to noscapine and to impurity A.

Limits:

– *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),

– *any other impurity*: not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),

- *total of other impurities*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Loss on drying (2.2.32): maximum 1.0 per cent, determined on 0.500 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.350 g in 40 ml of *anhydrous acetic acid R*, warming gently. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 41.34 mg of $C_{22}H_{23}NO_7$.

STORAGE

Protected from light.

IMPURITIES

A. papaverine.

01/2005:0515

NOSCAPINE HYDROCHLORIDE

Noscapini hydrochloridum

$C_{22}H_{24}ClNO_7 \cdot H_2O$

M_r 467.9

DEFINITION

(3*S*)-6,7-Dimethoxy-3-[(5*R*)-4-methoxy-6-methyl-5,6,7,8-tetrahydro-1,3-dioxolo[4,5-*g*]isoquinolin-5-yl]isobenzofuran-1(3*H*)-one hydrochloride monohydrate.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white, crystalline powder or colourless crystals, hygroscopic.

Solubility: freely soluble in water and in alcohol. Aqueous solutions are faintly acid; the base may be precipitated when the solutions are allowed to stand.

mp: about 200 °C, with decomposition.

IDENTIFICATION

First identification: C, E.

Second identification: A, B, D, E.

A. It complies with the test for specific optical rotation (see Tests).

B. Melting point (2.2.14) of the precipitate obtained in identification test E: 174 °C to 177 °C.

C. Infrared absorption spectrophotometry (2.2.24).

Preparation: examine the precipitate obtained in identification test E.

Comparison: noscapine CRS.

D. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 25 mg of the substance to be examined in *alcohol R* and dilute to 100 ml with the same solvent.

Reference solution. Dissolve 22 mg of *noscapine CRS* in *acetone R* and dilute to 100 ml with the same solvent.

Plate: TLC silica gel plate *R*.

Mobile phase: concentrated ammonia *R*, alcohol *R*, acetone *R*, toluene *R* (1:3:20:20 V/V/V/V).

Application: 10 µl.

Development: over 2/3 of the plate.

Drying: in air.

Detection: spray with dilute potassium iodobismuthate solution *R*.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

E. Dissolve about 40 mg in a mixture of 2 ml of *water R* and 3 ml of *alcohol R* and add 1 ml of dilute ammonia *R*2. Heat until dissolution is complete. Allow to cool, scratching the wall of the tube with a glass rod. Filter. The filtrate gives reaction (a) of chlorides (2.3.1). Wash the precipitate with *water R*, dry at 100–105 °C and reserve for identification tests B and C.

TESTS

Appearance of solution. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₆ or BY₆ (2.2.2, Method II).

Dissolve 0.5 g in *water R*, add 0.3 ml of 0.1 M *hydrochloric acid* and dilute to 25 ml with *water R*.

pH (2.2.3): minimum 3.0.

Dissolve 0.2 g in 10 ml of carbon dioxide-free *water R*.

Specific optical rotation (2.2.7): + 38.5 to + 44.0 (dried substance).

Dissolve 0.500 g in 0.01 M *hydrochloric acid* and dilute to 25.0 ml with the same acid.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 20.0 mg of the substance to be examined with gentle heating in 14 ml of *methanol R*, cool the solution and dilute to 20.0 ml with *phosphate buffer solution pH 6.0 RI*.

Reference solution (a). Dilute 1.0 ml of the test solution to 20.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of *papaverine hydrochloride R* in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

Reference solution (c). Dissolve 1.5 mg of *papaverine hydrochloride R* in 10 ml of the test solution and dilute to 50 ml with the mobile phase.

Column:

– *size*: $l = 0.125$ m, $\varnothing = 4.6$ mm,

– *stationary phase*: nitrile silica gel for chromatography *R* (5 µm).

Mobile phase: *methanol R*, *phosphate buffer solution pH 6.0 RI* (350:650 V/V).

Flow rate: 1 ml/min.

Detection: spectrophotometer at 240 nm.

Injection: 20 µl.

Run time: 2.5 times the retention time of noscapine.

Relative retention with reference to noscapine (retention time = about 10 min): impurity A = about 1.3.

System suitability: reference solution (c):

- **resolution:** minimum 2 between the peaks due to noscapine and to impurity A.

Limits:

- **impurity A:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
- **any other impurity:** not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),
- **total of other impurities:** not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- **disregard limit:** 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Loss on drying (2.2.32): 2.5 per cent to 6.5 per cent, determined on 0.200 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.400 g in a mixture of 5.0 ml of 0.01 M hydrochloric acid and 50 ml of alcohol R. Carry out a potentiometric titration (2.2.20), using 0.1 M sodium hydroxide. Read the volume added between the 2 points of inflexion.

1 ml of 0.1 M sodium hydroxide is equivalent to 44.99 mg of C₂₂H₂₄ClNO₇.

STORAGE

In an airtight container, protected from light.

IMPURITIES

A. papaverine.

01/2005:1552

NUTMEG OIL

Myristicae fragrantis aetheroleum

DEFINITION

Nutmeg oil is obtained by steam distillation of the dried and crushed kernels of *Myristica fragrans* Houtt.

CHARACTERS

A colourless or pale yellow liquid, with a spicy odour.

IDENTIFICATION

First identification: B.

Second identification: A.

A. Examine by thin-layer chromatography (2.2.27), using a TLC silica gel plate R.

Test solution. Dissolve 1 ml of the substance to be examined in toluene R and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 20 µl of myristicine R in 10 ml of toluene R.

Apply to the plate as bands 10 µl of each solution. Develop over a path of 15 cm using a mixture of 5 volumes of ethyl acetate R and 95 volumes of toluene R. Allow the plate to dry in air and spray with vanillin reagent R. Heat the plate at 100 °C to 105 °C for 10 min. Examine in daylight.

The chromatogram obtained with the reference solution shows in the upper third a pink to reddish-brown zone (myristicine). The chromatogram obtained with the test solution shows a series of zones of which one is similar in position and colour to the zone in the chromatogram obtained with the reference solution. Above this zone a brownish zone (safrole) and a violet zone (hydrocarbons) are present. Below the myristicine zone, 5 blue zones of variable intensity are present.

B. Examine the chromatograms obtained in the test for chromatographic profile. The retention times of the principal peaks in the chromatogram obtained with the test solution are similar to those in the chromatogram obtained with the reference solution.

TESTS

Relative density (2.2.5): 0.885 to 0.905.

Refractive index (2.2.6): 1.475 to 1.485.

Optical rotation (2.2.7): + 8° to + 18°.

Chromatographic profile. Examine by gas chromatography (2.2.28).

Test solution. The substance to be examined.

Reference solution. Dissolve 15 µl of α-pinene R, 15 µl of β-pinene R, 15 µl of sabinene R, 5 µl of car-3-ene R, 5 µl of limonene R, 5 µl of γ-terpinene R, 5 µl of terpinen-4-ol R, 5 µl of safrole R and 10 µl of myristicine R in 1 ml of hexane R.

The chromatographic procedure may be carried out using:

- a fused-silica column 25 m to 60 m long and about 0.3 mm in internal diameter, coated with macrogol 20 000 R as the bonded phase,
- helium for chromatography R as the carrier gas at a flow rate of 1.5 ml/min,
- a flame-ionisation detector,
- a split ratio of 1:100.
- with the following temperature programme:

	Time (min)	Temperature (°C)	Rate (°C/min)	Comment
Column	0 - 10	50	–	isothermal
	10 - 75	50 → 180	2	linear gradient
	75 - 130	180	–	isothermal
Injection port		200 - 220		
Detector		240 - 250		

Inject 0.2 µl of the reference solution. When the chromatogram is recorded in the prescribed conditions, the components elute in the order indicated in the composition of the reference solution. Record the retention times of these substances.

The test is not valid unless the resolution between the peaks corresponding to β-pinene and sabinene is at least 1.5.

Inject 0.2 µl of the test solution. Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution. Determine the percentage content of each of these components by the normalisation procedure.

The percentages are within the following ranges:

- α-pinene: 15 per cent to 28 per cent,
- β-pinene: 13 per cent to 18 per cent,
- sabinene: 14 per cent to 29 per cent,
- car-3-ene: 0.5 per cent to 2.0 per cent,
- limonene: 2.0 per cent to 7.0 per cent,
- γ-terpinene: 2.0 per cent to 6.0 per cent,

- *terpinen-4-ol*: 2.0 per cent to 6.0 per cent,
- *safrole*: less than 2.5 per cent,
- *myristicine*: 5.0 per cent to 12.0 per cent.

STORAGE

Store in a well-filled, airtight container, protected from light and heat.

01/2005:0517

NYSTATIN**Nystatinum**C₄₇H₇₅NO₁₇M_r 926**DEFINITION**

Antifungal substance obtained by fermentation using certain strains of *Streptomyces noursei* as the production micro-organism. It contains mainly tetraenes, the principal component being (1*S*,3*R*,4*R*,7*R*,9*R*,11*R*,15*S*,16*R*,17*R*,18*S*,19*E*,21*E*,25*E*,27*E*,29*E*,31*E*,33*R*,35*S*,36*R*,37*S*)-33-[(3-amino-3,6-dideoxy-β-D-mannopyranosyl)oxy]-1,3,4,7,9,11,17,37-octahydroxy-15,16,18-trimethyl-13-oxo-14,39-dioxabicyclo[33.3.1]nonatriaconta-19,21,25,27,29,31-hexaene-36-carboxylic acid (nystatin A1).

Content: minimum 4400 IU/mg (dried substance) and minimum 5000 IU/mg (dried substance) if intended for oral administration.

PRODUCTION

If nystatin is not intended for cutaneous administration, the method of manufacture is validated to demonstrate that the product, if tested, would comply with the following test.

Abnormal toxicity (2.6.9). Inject intraperitoneally into each mouse a quantity equivalent to not less than 600 IU suspended in 0.5 ml of a 5 g/l solution of *acacia R*.

CHARACTERS

Appearance: yellow or slightly brownish powder, hygroscopic.

Solubility: practically insoluble in water, freely soluble in dimethylformamide and in dimethyl sulphoxide, slightly soluble in methanol, practically insoluble in alcohol.

IDENTIFICATION

First identification: B, E.

Second identification: A, C, D.

A. Examine the solution prepared in the test for absorbance between 220 nm and 350 nm (2.2.25). The solution shows 4 absorption maxima at 230 nm, 291 nm, 305 nm

and 319 nm, and a shoulder at 280 nm. The ratios of the absorbances at the absorption maxima at 291 nm and 319 nm to the absorbance at the absorption maximum at 305 nm are 0.61 to 0.73 and 0.83 to 0.96, respectively. The ratio of the absorbance measured at the absorption maximum at 230 nm to that measured at the shoulder at 280 nm is 0.83 to 1.25.

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: *nystatin CRS*.

C. To about 2 mg add 0.1 ml of *hydrochloric acid R*. A brown colour develops.

D. To about 2 mg add 0.1 ml of *sulphuric acid R*. A brown colour develops that becomes violet on standing.

E. Examine the chromatograms obtained in the test for composition.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

TESTS

Absorbance (2.2.25). Dissolve 0.10 g in a mixture of 5.0 ml of *glacial acetic acid R* and 50 ml of *methanol R* and dilute to 100.0 ml with *methanol R*. Dilute 1.0 ml of the solution to 100.0 ml with *methanol R*. Determined at the maximum at 305 nm within 30 min of preparation of the solution, the absorbance is not less than 0.60.

Composition. Liquid chromatography (2.2.29): use the normalisation procedure. Carry out the test protected from light.

Test solution. Dissolve 20 mg of the substance to be examined in *dimethyl sulphoxide R* and dilute to 50 ml with the same solvent.

Reference solution (a). Dissolve 20 mg of *nystatin CRS* in *dimethyl sulphoxide R* and dilute to 50 ml with the same solvent.

Reference solution (b). Dissolve 20 mg of the substance to be examined in 25 ml of *methanol R* and dilute to 50 ml with *water R*. To 10.0 ml of the solution add 2.0 ml of *dilute hydrochloric acid R*. Allow to stand at room temperature for 1 h.

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 100.0 ml with *dimethyl sulphoxide R*. Dilute 1.0 ml of this solution to 10.0 ml with *dimethyl sulphoxide R*.

Column:

- size: $l = 0.15$ m, $\varnothing = 4.6$ mm,
- stationary phase: base-deactivated end-capped octadecylsilyl silica gel for chromatography *R* (5 μ m),
- temperature: 30 °C.

Mobile phase:

- mobile phase A: *acetonitrile R*, 3.85 g/l solution of *ammonium acetate R* (29:71 V/V),
- mobile phase B: 3.85 g/l solution of *ammonium acetate R*, *acetonitrile R* (40:60 V/V),

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 25	100	0
25 - 35	100 → 0	0 → 100
35 - 45	0	100
45 - 50	0 → 100	100 → 0
50 - 55	100	0

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 305 nm.

Injection: 20 µl

Retention time: nystatin A1 = about 14 min.

System suitability: reference solution (b):

- **resolution:** minimum 3.5 between the 2 principal peaks (retention time = about 13 min and 19 min).

Composition:

- **nystatin A1:** minimum 85.0 per cent,
- **any other compound:** maximum 4.0 per cent,
- **disregard limit:** the area of the principal peak in the chromatogram obtained with reference solution (c); disregard any peak with a retention time of less than 2 min.

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32): maximum 5.0 per cent, determined on 1.000 g by drying at 60 °C over *diphosphorus pentoxide R* at a pressure not exceeding 0.1 kPa for 3 h.

Sulphated ash (2.4.14): maximum 3.5 per cent, determined on 1.0 g.

ASSAY

Carry out the microbiological assay of antibiotics (2.7.2).

Protect the solutions from light throughout the assay.

Dissolve the substance to be examined and *nystatin CRS* separately in *dimethylformamide R* and dilute with a mixture of 5 volumes of *dimethylformamide R* and 95 volumes of buffer solution pH 6.0.

STORAGE

In an airtight container, protected from light.

LABELLING

The label states where applicable, that the substance is only for cutaneous use.

OAK BARK

Quercus cortex

DEFINITION

Cut and dried bark from the fresh young branches of *Quercus robur* L., *Q. petraea* (Matt.) Liebl. and *Q. pubescens* Willd.

Content: minimum 3.0 per cent of tannins, expressed as pyrogallol ($C_6H_6O_3$; M_r 126.1) (dried drug).

CHARACTERS

Macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The bark occurs in channelled or quilled pieces, not more than 3 mm thick. The outer surface is light grey or greenish-grey, rather smooth, with occasional lenticels. The inner surface is dull brown or reddish-brown and has slightly raised longitudinal striations about 0.5 mm to 1 mm wide. The fracture is splintery and fibrous.
- B. Reduce to a powder (355). The powder is light brown to reddish-brown and fibrous. Examine under a microscope using *chloral hydrate solution R*. The powder shows groups of thick-walled fibres surrounded by a moderately thickened parenchymatous sheath containing prism crystals of calcium oxalate; fragments of cork composed of thin-walled tabular cells filled with brownish or reddish contents; abundant sclereids, isolated and in groups, some large with thick, stratified walls and branching pits, others smaller and thinner-walled with simple pits, often with dense brown contents; fragments of parenchyma containing cluster crystals of calcium oxalate; occasional fragments of sieve tissue, thin-walled, some showing sieve areas on the oblique end-walls.
- C. To 1 g of the powdered drug (710) add 10 ml of *alcohol* (30 per cent V/V) *R* and heat the mixture under a reflux condenser on a water-bath for 30 min. Cool and filter. To 1 ml of the solution add 2 ml of a 10 g/l solution of *vanillin R* in *hydrochloric acid R*. A red colour develops.

TESTS

Foreign matter (2.8.2): maximum 2 per cent.

Loss on drying (2.2.32): maximum 10.0 per cent, determined on 1.000 g of the powdered drug (710) by drying in an oven at 100–105 °C for 2 h.

Total ash (2.4.16): maximum 8.0 per cent.

ASSAY

Carry out the determination of tannins in herbal drugs (2.8.14). Use 0.700 g of the powdered drug (710).

01/2005:1887 CHARACTERS

Appearance: clear, colourless or light yellow, viscous liquid.

Solubility: miscible with water, with ethanol and with vegetable oils.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: *Ph. Eur. reference spectrum of octoxinol 10*.

Preparation: film between *sodium chloride R* plates.

B. It complies with the test for cloud point (see Tests).

TESTS

Acidity or alkalinity. Boil 1.0 g with 20 ml of *carbon dioxide-free water R* for 1 min, with constant stirring. Cool and filter. To 10 ml of the filtrate, add 0.05 ml of *bromothymol blue solution R1*. Not more than 0.5 ml of 0.01 M *hydrochloric acid* or 0.01 M *sodium hydroxide* is required to change the colour of the indicator.

Hydroxyl value (2.5.3, *Method A*): 85 to 101.

Cloud point: 63 °C to 70 °C.

Dissolve 1.0 g in 99 g of *water R*. Transfer about 30 ml of this solution to a test-tube, heat on a water-bath and stir continuously until the solution becomes cloudy. Remove the test-tube from the water-bath (ensuring that the temperature does not increase more than 2 °C), and continue to stir. The cloud point is the temperature at which the solution becomes sufficiently clear that the entire thermometer bulb is plainly seen.

Ethylene oxide and dioxan (2.4.25): maximum 1 ppm of ethylene oxide and maximum 10 ppm of dioxan.

Heavy metals (2.4.8): maximum 10 ppm.

Dissolve 2.0 g in *distilled water R* and dilute to 20.0 ml with the same solvent. 12 ml of this solution complies with limit test A. Prepare the standard using *lead standard solution* (1 ppm Pb) *R*.

Water (2.5.12): maximum 0.5 per cent, determined on 2.00 g.

Total ash (2.4.16): maximum 0.4 per cent, determined on 1.0 g.

STORAGE

In an airtight container.

01/2005:2057

OCTYL GALLATE

Octylis gallas

 $C_{15}H_{22}O_5$
 M_r 282.3

DEFINITION

Octyl 3,4,5-trihydroxybenzoate.

Content: 97.0 per cent to 103.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

OCTOXINOL 10

Octoxinolum 10

DEFINITION

α -[4-(1,1,3,3-Tetramethylbutyl)phenyl]- ω -hydroxydeca(oxyethylene).

Mixture consisting mainly of mono-octylphenyl ethers of macrogols corresponding to the formula $C_8H_{17}C_6H_4-[OCH_2CH_2]_n-OH$ where the average value of n is 10. It may contain free macrogols.

01/2005:1553

Solubility: practically insoluble in water, freely soluble in ethanol (96 per cent), practically insoluble in methylene chloride.

IDENTIFICATION

A. Melting point (2.2.14).

Determine the melting point of the substance to be examined. Mix equal parts of the substance to be examined and *octyl gallate CRS* and determine the melting point of the mixture. The difference between the melting points (which are about 101 °C) is not greater than 2 °C.

B. Examine the chromatograms obtained in the test for impurity A.

Results: the principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

Impurity A. Thin-layer chromatography (2.2.27).

Test solution (a). Dissolve 0.20 g of the substance to be examined in *acetone R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1.0 ml of test solution (a) to 20 ml with *acetone R*.

Reference solution (a). Dissolve 10 mg of *octyl gallate CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 20 mg of *gallic acid R* in *acetone R* and dilute to 20 ml with the same solvent.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 10 ml with *acetone R*.

Reference solution (d). Dilute 1.0 ml of reference solution (b) to 5 ml with test solution (a).

Plate: *TLC silica gel plate R*.

Mobile phase: *anhydrous formic acid R, ethyl formate R, toluene R* (10:40:50 V/V/V).

Application: 5 µl of test solutions (a) and (b) and reference solutions (a), (c) and (d).

Development: over 2/3 of the plate.

Drying: in air for 10 min.

Detection: spray with a mixture of 1 volume of *ferric chloride solution R1* and 9 volumes of *ethanol (96 per cent) R*.

System suitability: reference solution (d):

- the chromatogram shows 2 clearly separated principal spots.

Limit: test solution (a):

- **impurity A:** any spot due to impurity A is not more intense than the spot in the chromatogram obtained with reference solution (c) (0.5 per cent).

Chlorides (2.4.4): maximum 100 ppm.

To 1.65 g add 50 ml of *water R*. Shake for 5 min. Filter. 15 ml of the filtrate complies with the test.

Heavy metals (2.4.8): maximum 10 ppm.

2.0 g complies with limit test C. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 70 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in *methanol R* and dilute to 250.0 ml with the same solvent. Dilute 5.0 ml of the solution to 200.0 ml with *methanol R*. Measure the absorbance (2.2.25) at the absorption maximum at 275 nm.

Calculate the content of $C_{15}H_{32}O_2$ taking the specific absorbance to be 387.

STORAGE

In a non-metallic container, protected from light.

IMPURITIES

Specified impurities: A.

A. 3,4,5-trihydroxybenzoic acid (gallic acid).

01/2005:1136

OCTYLDODECANOL

Octyldodecanolum

DEFINITION

Condensation product of saturated liquid fatty alcohols.

Content: not less than 90 per cent of (2*RS*)-2-octyldodecan-1-ol ($C_{20}H_{42}O$; M_r 298.6), the remainder consisting mainly of related alcohols.

CHARACTERS

Appearance: clear, colourless or yellowish, oily liquid.

Solubility: practically insoluble in water, miscible with alcohol.

Relative density: about 0.840.

Refractive index: about 1.455.

IDENTIFICATION

A. It complies with the test for hydroxyl value (see Tests).

B. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 0.20 g of the substance to be examined in *toluene R* and dilute to 20 ml with the same solvent.

Reference solution. Dissolve 0.20 g of *octyldodecanol CRS* in *toluene R* and dilute to 20 ml with the same solvent.

Plate: suitable silica gel plate.

Mobile phase: *ethyl acetate R, toluene R* (5:95 V/V).

Application: 2 µl.

Development: over a path of 12 cm.

Drying: in air.

Detection: spray with about 7 ml of a mixture of 1 volume of a 25 g/l solution of *vanillin R* in *alcohol R* and 4 volumes of *sulphuric acid R* and heat at 130 °C for 5-10 min.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

01/2005:1455

OFLOXACIN

Ofloxacinum

 $C_{18}H_{20}FN_3O_4$ M_r 361.4

DEFINITION

Ofloxacin contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (RS)-9-fluoro-3-methyl-10-(4-methylpiperazin-1-yl)-7-oxo-2,3-dihydro-7H-pyrido[1,2,3-de]-1,4-benzoxazine-6-carboxylic acid, calculated with reference to the dried substance.

CHARACTERS

A pale yellow or bright yellow, crystalline powder, slightly soluble in water, soluble in glacial acetic acid, slightly soluble to soluble in methylene chloride, slightly soluble in methanol.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *ofloxacin CRS*. Examine the substances prepared as discs.

TESTS

Absorbance (2.2.25). Dissolve 0.5 g in 0.1 M hydrochloric acid and dilute to 100 ml with the same solvent. The absorbance of the solution measured at 440 nm is not greater than 0.25.

Optical rotation (2.2.7). Dissolve 0.300 g in a mixture of 10 volumes of *methanol R* and 40 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents. The angle of optical rotation is -0.10° to $+0.10^\circ$.

Impurity A. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel GF₂₅₄ plate R* (2 µm to 10 µm).

Test solution. Dissolve 0.250 g of the substance to be examined in a mixture of 10 volumes of *methanol R* and 40 volumes of *methylene chloride R* and dilute to 5.0 ml with the same mixture of solvents.

Reference solution. Dissolve 10 mg of *ofloxacin impurity A CRS* in a mixture of 10 volumes of *methanol R* and 40 volumes of *methylene chloride R* and dilute to 100.0 ml with the same mixture of solvents.

Apply to the plate 10 µl of each solution. Develop over a path of 10 cm using a mixture of 1 volume of *glacial acetic acid R*, 1 volume of *water R* and 2 volumes of *ethyl acetate R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot due to impurity A in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (0.2 per cent).

Related substances. Examine by liquid chromatography (2.2.29). Prepare the solutions immediately before use.

Test solution. Dissolve 10.0 mg of the substance to be examined in a mixture of 10 volumes of *acetonitrile R* and 60 volumes of *water R* and dilute to 50.0 ml with the same mixture of solvents.

TESTS

Acidity or alkalinity. Mix 5.0 g thoroughly for 1 min with a mixture of 0.1 ml of *bromothymol blue solution R1*, 2 ml of *heptane R* and 10 ml of *water R*. If the aqueous layer is blue, not more than 0.15 ml of 0.01 M hydrochloric acid is required to change the colour of the indicator to yellow. If the aqueous layer is yellow, add 0.45 ml of 0.1 M sodium hydroxide and shake vigorously. After standing to ensure complete separation, the aqueous layer is blue.

Optical rotation (2.2.7): -0.10° to $+0.10^\circ$.

Dissolve 2.50 g in *alcohol R* and dilute to 25 ml with the same solvent.

Hydroxyl value (2.5.3, Method A): 175 to 190.

Iodine value (2.5.4): maximum 8.0.

Peroxide value (2.5.5): maximum 5.0.

Saponification value (2.5.6): maximum 5.0.

Heavy metals (2.4.8): maximum 10 ppm.

2.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (2.5.12): maximum 0.5 per cent, determined on 2.00 g.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Gas chromatography (2.2.28).

Internal standard solution. Dissolve 0.4 g of *tetradecane R* in *hexane R* and dilute to 100.0 ml with the same solvent.

Test solution. Dissolve 0.100 g of the substance to be examined in the internal standard solution and dilute to 10.0 ml with the same solution.

Reference solution. Dissolve 0.100 g of *octyldodecanol CRS* in the internal standard solution and dilute to 10.0 ml with the same solution.

Column:

- **material:** stainless steel,
- **size:** $l = 60$ m, $\varnothing = 0.25$ mm,
- **stationary phase:** *poly(dimethyl)(diphenyl)(divinyl)siloxane R* (film thickness 0.25 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 0.68 ml/min.

Temperature:

	Time (min)	Temperature (°C)
	0 - 2	180
Column	2 - 22	180 → 280
	22 - 52	280
Injection port		290
Detector		300

Detection: flame ionisation.

Injection: 1 µl.

Calculate the content of $C_{20}H_{42}O$ in the substance to be examined.

STORAGE

Protected from light.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with a mixture of 10 volumes of *acetonitrile R* and 60 volumes of *water R*. Dilute 1.0 ml of this solution to 10.0 ml with a mixture of 10 volumes of *acetonitrile R* and 60 volumes of *water R*.

Reference solution (b). Dissolve 10.0 mg of *ofloxacin impurity E CRS* in a mixture of 10 volumes of *acetonitrile R* and 60 volumes of *water R* and dilute to 100.0 ml with the same mixture of solvents. Mix 10.0 ml of this solution with 5.0 ml of the test solution. Dilute to 50.0 ml with a mixture of 10 volumes of *acetonitrile R* and 60 volumes of *water R*. Dilute 1.0 ml of this solution to 50.0 ml with a mixture of 10 volumes of *acetonitrile R* and 60 volumes of *water R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase a mixture prepared as follows: dissolve 4.0 g of *ammonium acetate R* and 7.0 g of *sodium perchlorate R* in 1300 ml of *water R*. Adjust to pH 2.2 with *phosphoric acid R*. Add 240 ml of *acetonitrile R*. Adjust the flow rate of the mobile phase so that a retention time of about 20 min is obtained for ofloxacin,
- as detector a spectrophotometer set at 294 nm, maintaining the temperature of the column at 45 °C.

Inject 10 µl of reference solution (b). Adjust the sensitivity of the system so that the heights of the two principal peaks in the chromatogram obtained are at least 50 per cent of the full scale of the recorder. The test is not valid unless: in the chromatogram obtained, the resolution between the peaks corresponding to impurity E and ofloxacin is at least 2.0. Inject 10 µl of the test solution and 10 µl of reference solution (a). Continue the chromatography for 2.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent); the sum of the areas of all the peaks is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a).

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.2 per cent, determined on 1.000 g by drying at 100 °C to 105 °C for 4 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 100 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid* determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 36.14 mg of C₁₈H₂₀FN₃O₄.

STORAGE

Store in an airtight container, protected from light.

IMPURITIES

A. (RS)-9,10-difluoro-3-methyl-7-oxo-2,3-dihydro-7H-pyrido[1,2,3-de]-1,4-benzoxazine-6-carboxylic acid (FPA),

B. R1 = H, R2 = F, R3 = CH₃: (RS)-9-fluoro-3-methyl-10-(4-methylpiperazin-1-yl)-2,3-dihydro-7H-pyrido[1,2,3-de]-1,4-benzoxazine-7-one,

C. R1 = CO₂H, R2 = H, R3 = CH₃: (RS)-3-methyl-10-(4-methylpiperazin-1-yl)-7-oxo-2,3-dihydro-7H-pyrido[1,2,3-de]-1,4-benzoxazine-6-carboxylic acid,

E. R1 = CO₂H, R2 = F, R3 = H: (RS)-9-fluoro-3-methyl-7-oxo-10-(piperazin-1-yl)-2,3-dihydro-7H-pyrido[1,2,3-de]-1,4-benzoxazine-6-carboxylic acid,

D. (RS)-10-fluoro-3-methyl-9-(4-methylpiperazin-1-yl)-7-oxo-2,3-dihydro-7H-pyrido[1,2,3-de]-1,4-benzoxazine-6-carboxylic acid,

F. 4-[(RS)-6-carboxy-9-fluoro-3-methyl-7-oxo-2,3-dihydro-7H-pyrido[1,2,3-de]-1,4-benzoxazine-10-yl]-1-methylpiperazine 1-oxide.

01/2005:0799

OLEIC ACID

Acidum oleicum

DEFINITION

(Z)-Octadec-9-enoic acid (C₁₈H₃₄O₂; M_r 282.5), together with varying amounts of saturated and other unsaturated fatty acids. A suitable antioxidant may be added.

Content: 65.0 per cent to 88.0 per cent of C₁₈H₃₄O₂.

CHARACTERS

Appearance: clear, yellowish or brownish, oily liquid.

Solubility: practically insoluble in water, miscible with alcohol and with methylene chloride.

Relative density: about 0.892.

IDENTIFICATION

- A. It complies with the test for acid value (see Tests).
- B. It complies with the test for iodine value (see Tests).
- C. It complies with the test for composition of fatty acids (see Tests).

Margaric acid: maximum 0.2 per cent for oleic acid of vegetable origin and maximum 4.0 per cent for oleic acid of animal origin.

TESTS

Appearance. The substance to be examined is not more intensely coloured than reference solution Y₁ or BY₁ (2.2.2, Method I).

Acid value (2.5.1): 195 to 204, determined on 0.5 g.

Iodine value (2.5.4): 89 to 105.

Peroxide value (2.5.5): maximum 10.0.

Composition of fatty acids. Gas chromatography (2.4.22, Method C).

Test solution. Prepare as described in the method but omitting the initial hydrolysis.

Composition of the fatty acid fraction of the substance:

- *myristic acid*: maximum 5.0 per cent,
- *palmitic acid*: maximum 16.0 per cent,
- *palmitoleic acid*: maximum 8.0 per cent,
- *stearic acid*: maximum 6.0 per cent,
- *oleic acid*: 65.0 per cent to 88.0 per cent,
- *linoleic acid*: maximum 18.0 per cent,
- *linolenic acid*: maximum 4.0 per cent,
- *fatty acids of chain length greater than C₁₈*: maximum 4.0 per cent.

Total ash (2.4.16): maximum 0.1 per cent, determined on 2.00 g.

STORAGE

In an airtight, well-filled container, protected from light.

LABELLING

The label states:

- the name and concentration of any added antioxidant,
- the origin of oleic acid (animal or vegetable).

01/2005:1249

OLEOYL MACROGOLGLYCERIDES

Macrogolglyceridorum oleates

DEFINITION

Oleoyl macrogolglycerides are mixtures of monoesters, diesters and triesters of glycerol and monoesters and diesters of macrogols. They are obtained by partial alcoholysis of an unsaturated oil mainly containing triglycerides of oleic acid using macrogol with a mean relative molecular mass between 300 and 400 or by esterification of glycerol and macrogol with unsaturated fatty acids or by mixing glycerol esters and condensates of ethylene oxide with the fatty acids of this unsaturated oil.

CHARACTERS

Amber oily liquids, which may give rise to a deposit after prolonged periods at 20 °C, practically insoluble but dispersible in water, freely soluble in methylene chloride.

The viscosity at 40 °C is about 35 mPas, the relative density at 20 °C is about 0.95 and the refractive index at 20 °C is about 1.47.

IDENTIFICATION

- A. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution. Dissolve 1.0 g of the substance to be examined in *methylene chloride R* and dilute to 20 ml with the same solvent.

Apply to the plate 10 µl of the test solution. Develop over a path of 15 cm using a mixture of 30 volumes of *hexane R* and 70 volumes of *ether R*. Allow the plate to dry in air. Spray with a 0.1 g/l solution of *rhodamine B R* in *alcohol R* and examine in ultraviolet light at 365 nm. The chromatogram shows a spot corresponding to triglycerides with an *R_f* value of about 0.9 (*R_{st}* 1) and spots corresponding to 1,3-diglycerides (*R_f* 0.7), to 1,2-diglycerides (*R_f* 0.6), to monoglycerides (*R_f* 0.1) and to esters of macrogol (*R_f* 0).

- B. They comply with the test for hydroxyl value (see Tests).
- C. They comply with the test for fatty acid composition (see Tests).
- D. They comply with the test for saponification value (see Tests).

TESTS

Acid value (2.5.1). Not more than 2.0, determined on 2.0 g.

Hydroxyl value (2.5.3, Method A): 45 to 65, determined on 1.0 g.

Iodine value (2.5.4): 75 to 95.

Peroxide value (2.5.5). Not more than 12.0, determined on 2.0 g.

Saponification value (2.5.6): 150 to 170, determined on 2.0 g.

Alkaline impurities. Introduce 5.0 g into a test-tube and carefully add a mixture, neutralised if necessary with 0.01 *M* hydrochloric acid or with 0.01 *M* sodium hydroxide, of 0.05 ml of a 0.4 g/l solution of *bromophenol blue R* in *alcohol R*, 0.3 ml of *water R* and 10 ml of *alcohol R*. Shake and allow to stand. Not more than 1.0 ml of 0.01 *M* hydrochloric acid is required to change the colour of the upper layer to yellow.

Free glycerol. Not more than 3.0 per cent. Dissolve 1.20 g in 25.0 ml of *methylene chloride R*. Heat if necessary. After cooling, add 100 ml of *water R*. Shake and add 25.0 ml of a 6 g/l solution of *periodic acid R*. Shake and allow to stand for 30 min. Add 40 ml of a 75 g/l solution of *potassium iodide R*. Allow to stand for 1 min. Add 1 ml of *starch solution R*. Titrate the iodine with 0.1 *M* sodium thiosulphate. Carry out a blank titration.

1 ml of 0.1 *M* sodium thiosulphate is equivalent to 2.3 mg of glycerol.

Composition of fatty acids (2.4.22, Method A). The fatty-acid fraction has the following composition:

- *palmitic acid*: 4.0 per cent to 9.0 per cent,
- *stearic acid*: not more than 6.0 per cent,
- *oleic acid*: 58.0 per cent to 80.0 per cent,
- *linoleic acid*: 15.0 per cent to 35.0 per cent,
- *linolenic acid*: not more than 2.0 per cent,

- *arachidic acid*: not more than 2.0 per cent,
- *eicosenoic acid*: not more than 2.0 per cent.

Ethylene oxide and dioxan (2.4.25). Not more than 1 ppm of ethylene oxide and 10 ppm of dioxan.

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) R.

Water (2.5.12). Not more than 1.0 per cent, determined on 1.0 g by the semi-micro determination of water. Use a mixture of 30 volumes of *anhydrous methanol* R and 70 volumes of *methylene chloride* R as solvent.

Total ash (2.4.16). Not more than 0.1 per cent, determined on 1.0 g.

STORAGE

Store protected from light and at room temperature.

LABELLING

The label states the type of macrogol used (mean relative molecular mass) or the number of units of ethylene oxide per molecule (nominal value).

01/2005:2073

OLEYL ALCOHOL

Alcohol oleicus

DEFINITION

Mixture of unsaturated and saturated long-chain fatty alcohols consisting mainly of octadec-9-enol (oleyl alcohol and elaidyl alcohol; $C_{18}H_{36}O$; M_r 268.5). It may be of vegetable or animal origin.

CHARACTERS

Appearance: colourless or light yellow liquid.

IDENTIFICATION

- It complies with the test for hydroxyl value (see Tests).
- It complies with the test for composition of fatty alcohols (see Tests).

TESTS

Appearance. The substance to be examined is clear (2.2.1) and not more intensely coloured than reference solution B₆ (2.2.2, *Method II*).

Refractive index (2.2.6): 1.458 to 1.460, determined at 25 °C.

Cloud point: maximum 10 °C.

Introduce about 60 g into a cylindrical flat-bottomed container, 30-33.5 mm internal diameter and 115-125 mm high. Heat to 30 °C, cool, and immerse the container in iced water with the surfaces of the water and the sample at the same level. Insert a thermometer and, using it as a stirring rod begin stirring rapidly and steadily when the temperature falls below 20 °C. Keep the thermometer immersed throughout the test, remove and examine the container at regular intervals. The cloud point is the temperature at which the immersed portion of the thermometer, positioned vertically in the centre of the container, is no longer visible when viewed horizontally through the container and sample.

Acid value (2.5.1): maximum 1.0, determined on 5.0 g.

Hydroxyl value (2.5.3, *Method A*): 205 to 215.

Saponification value (2.5.6): maximum 2.0.

Composition of fatty alcohols. Gas chromatography (2.2.28): use the normalisation procedure.

Test solution. Mix 25 mg of the substance to be examined with 1.0 ml of *methylene chloride* R.

Reference solution (a). Dissolve 25 mg of each of *arachidyl alcohol* R, *linolenyl alcohol* R, *linoleyl alcohol* R, *oleyl alcohol* R, *palmityl alcohol* R and *stearyl alcohol* R in *methylene chloride* R and dilute to 5 ml with the same solvent. Dilute 1 ml of this solution to 5 ml with *methylene chloride* R.

Reference solution (b). Dissolve 10 mg of *linoleyl alcohol* R and 1 g of *oleyl alcohol* R in *methylene chloride* R and dilute to 40 ml with the same solvent.

Column:

- **size**: $l = 30$ m, $\varnothing = 0.32$ mm,
- **stationary phase**: *poly(dimethyl)siloxane* R (film thickness 1 μ m).

Carrier gas: *helium for chromatography* R.

Flow rate: 1 ml/min.

Split ratio: 1:11.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 1	170
	1 - 9	170 → 210
	9 - 65	210
Injection port		270
Detector		280

Detection: flame ionisation.

Injection: 1 μ l.

Identify the peaks using the chromatogram obtained with reference solution (a).

Relative retention with reference to oleyl alcohol (retention time = about 30 min): *palmityl alcohol* = about 0.6; *linolenyl alcohol* = about 0.8; *linoleyl alcohol* = about 0.9; *stearyl alcohol* = about 1.1; *arachidyl alcohol* = about 1.9 (*elaidyl alcohol* co-elutes with *oleyl alcohol*).

System suitability: reference solution (b):

- **peak-to-valley ratio**: minimum 1.2 between the peaks due to *linoleyl alcohol* and *oleyl alcohol*.

Limits:

- *palmityl alcohol*: maximum 8.0 per cent,
- *stearyl alcohol*: maximum 5.0 per cent,
- *oleyl alcohol* (sum of *oleyl* and *elaidyl alcohols*): minimum 80.0 per cent,
- *linoleyl alcohol*: maximum 3.0 per cent,
- *linolenyl alcohol*: maximum 0.5 per cent,
- *arachidyl alcohol*: maximum 0.3 per cent.

01/2005:1878

OLIVE LEAF

Oleae folium

DEFINITION

Dried leaf of *Olea europaea* L.

Content: minimum 5.0 per cent of oleuropein ($C_{25}H_{32}O_{13}$; M_r 540.5) (dried drug).

CHARACTERS

Macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The leaf is simple, thick and coriaceous, lanceolate to obovate, 30 mm to 50 mm long and 10 mm to 15 mm wide, with a mucronate apex and tapering at the base to a short petiole; the margins are entire and reflexed abaxially. The upper surface is greyish-green, smooth and shiny, the lower surface paler and pubescent, particularly along the midrib and main lateral veins.
- B. Reduce to a powder (355). The powder is yellowish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the epidermis in surface view with small, thick-walled polygonal cells and, in the lower epidermis only, small anomocytic stomata (2.8.3); fragments of the lamina in sectional view showing a thick cuticle, a palisade composed of 3 layers of cells and a small-celled spongy parenchyma; numerous sclereids, very thick-walled and mostly fibre-like with blunt or, occasionally, forked ends, isolated or associated with the parenchyma of the mesophyll; abundant, very large peltate trichomes, with a central unicellular stalk from which radiate some 10 to 30 thin-walled cells which become free from the adjoining cells at the margin of the shield, given an uneven, jagged appearance.
- C. Thin-layer chromatography (2.2.27).

Test solution. To 1.0 g of the powdered drug (355) add 10 ml of *methanol R*. Boil under a reflux condenser for 15 min. Cool and filter.

Reference solution. Dissolve 10 mg of *oleuropein R* and 1 mg of *rutin R* in 1 ml of *methanol R*.

Plate: TLC silica gel plate *R*.

Mobile phase: *water R*, *methanol R*, *methylene chloride R* (1.5:15:85 V/V/V).

Application: 10 µl as bands.

Development: over a path of 10 cm.

Drying: in air.

Detection: spray with *vanillin reagent R* and heat at 100-105 °C for 5 min; examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A dark violet-blue zone (solvent front)
	A dark violet-blue zone
Oleuropein: a brownish-green zone	A brownish-green zone (oleuropein)
Rutin: a brownish-yellow zone	
Reference solution	Test solution

TESTS

Foreign matter (2.8.2): maximum 2 per cent.

Loss on drying (2.2.32): maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100-105 °C for 2 h.

Total ash (2.4.16): maximum 9.0 per cent.

ASSAY

Liquid chromatography (2.2.29).

Test solution. In a flask, place 1.000 g of the powdered drug (355) and add 50 ml of *methanol R*. Heat in a water-bath at 60 °C for 30 min with shaking. Allow to cool and filter into a 100 ml volumetric flask. Rinse the flask and the filter with *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml of the solution to 20.0 ml with *water R*.

Reference solution. Dissolve 5.0 mg of *oleuropein R* in 5.0 ml of *methanol R*. Dilute 1.0 ml of the solution to 25.0 ml with *water R*.

Column:

- size: $l = 0.15$ m, $\varnothing = 3.9$ mm,
- stationary phase: octadecylsilyl silica gel for chromatography *R* (5 µm),
- temperature: 25 °C.

Mobile phase:

- mobile phase A: dilute 1.0 ml of *glacial acetic acid R* to 100 ml with *water R*,
- mobile phase B: *methanol R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 5	85 → 40	15 → 60
5 - 12	40 → 20	60 → 80
12 - 15	20 → 85	80 → 15

Flow rate: 1 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 µl.

Retention time: oleuropein = about 9 min.

Calculate the percentage content of oleuropein from the expression.

$$\frac{A_1 \times m_2 \times p \times 8}{A_2 \times m_1}$$

A_1 = area of the peak due to oleuropein in the chromatogram obtained with the test solution,

A_2 = area of the peak due to oleuropein in the chromatogram obtained with the reference solution,

m_1 = mass of the drug to be examined, in grams,

m_2 = mass of *oleuropein R* in the reference solution, in grams,

p = percentage content of oleuropein in *oleuropein R*.

01/2005:1456

OLIVE OIL, REFINED

Olivae oleum raffinatum

DEFINITION

Refined olive oil is the fatty oil obtained by refining of crude olive oil, obtained by cold expression or other suitable mechanical means from the ripe drupes of *Olea europaea* L. A suitable antioxidant may be added.

CHARACTERS

A clear, colourless or greenish-yellow, transparent liquid, practically insoluble in alcohol, miscible with light petroleum (50 °C to 70 °C).

When cooled, it begins to become cloudy at 10 °C and becomes a butter-like mass at about 0 °C. It has a relative density of about 0.913.

IDENTIFICATION

- A. It complies with the test for absorbance (see Tests).
 B. Carry out the test for identification of fatty oils by thin-layer chromatography (2.3.2). The chromatogram obtained shows spots corresponding to those in the typical chromatogram for olive oil. For certain types of refined olive oil, the difference in the size of spots E and F is less pronounced than in the typical chromatogram.

TESTS

Acid value (2.5.1). Not more than 0.5, determined on 10.0 g.

Peroxide value (2.5.5, Method A). Not more than 10.0. If intended for use in the manufacture of parenteral dosage forms, not more than 5.0.

Unsaponifiable matter. Not more than 1.5 per cent. Place 5.0 g (*m* g) in a 150 ml flask fitted with a reflux condenser. Add 50 ml of 2 *M* alcoholic potassium hydroxide *R* and heat on a water-bath for 1 h, shaking frequently. Add 50 ml of water *R* through the top of the condenser, shake, allow to cool and transfer the contents of the flask to a separating funnel. Rinse the flask with several portions to a total of 50 ml of light petroleum *R1* and add the rinsings to the separating funnel. Shake vigorously for 1 min. Allow to separate and transfer the aqueous layer to a second separating funnel. If an emulsion forms, add small quantities of alcohol *R* or a concentrated solution of potassium hydroxide *R*. Shake the aqueous layer with 2 quantities, each of 50 ml, of light petroleum *R1*. Combine the light petroleum layers in a third separating funnel and wash with 3 quantities, each of 50 ml, of alcohol (50 per cent *V/V*) *R*. Transfer the light petroleum layer to a tared 250 ml flask. Rinse the separating funnel with small quantities of light petroleum *R1* and add to the flask. Evaporate the light petroleum on a water-bath and dry the residue at 100 °C to 105 °C for 15 min, keeping the flask horizontal. Allow to cool in a desiccator and weigh (*a* g). Repeat the drying for successive periods of 15 min until the loss of mass between 2 successive weighings does not exceed 0.1 per cent. Dissolve the residue in 20 ml of alcohol *R*, previously neutralised to 0.1 ml of bromophenol blue solution *R*. If necessary, titrate with 0.1 *M* hydrochloric acid (*b* ml).

Calculate the percentage content of unsaponifiable matter from the expression:

$$\frac{100(a - 0.032b)}{m}$$

If 0.032*b* is greater than 5 per cent of *a*, the test is invalid and must be repeated.

Alkaline impurities (2.4.19). It complies with the test for alkaline impurities in fatty oils.

Absorbance (2.2.25). Dissolve 1.00 g in cyclohexane *R* and dilute to 100.0 ml with the same solvent. The absorbance measured at 270 nm is 0.20 to 1.20.

Composition of fatty acids (2.4.22, Method A). The fatty acid fraction of the oil has the following composition:

- saturated fatty acids of chain length less than C_{16} : not more than 0.1 per cent,
- palmitic acid: 7.5 per cent to 20.0 per cent,
- palmitoleic acid (equivalent chain length on polyethyleneglycol adipate 16.3): not more than 3.5 per cent,
- stearic acid: 0.5 per cent to 5.0 per cent,

- oleic acid (equivalent chain length on polyethyleneglycol adipate 18.3): 56.0 per cent to 85.0 per cent,
- linoleic acid (equivalent chain length on polyethyleneglycol adipate 18.9): 3.5 per cent to 20.0 per cent,
- linolenic acid (equivalent chain length on polyethyleneglycol adipate 19.7): not more than 1.2 per cent,
- arachidic acid: not more than 0.7 per cent,
- eicosenoic acid (equivalent chain length on polyethyleneglycol adipate 20.3): not more than 0.4 per cent,
- behenic acid: not more than 0.2 per cent,
- lignoceric acid: not more than 0.2 per cent.

Sterols (2.4.23). The sterol fraction of the oil has the following composition:

- sum of contents of β -sitosterol, $\Delta 5,23$ -stigmastadienol, clerosterol, sitostanol, $\Delta 5$ -avenasterol and $\Delta 5,24$ -stigmastadienol: not less than 93.0 per cent,
- cholesterol: not more than 0.5 per cent,
- $\Delta 7$ -stigmasterol: not more than 0.5 per cent,
- campesterol: not more than 4.0 per cent,

and the content of stigmasterol is not more than that of campesterol.

Sesame oil. In a ground-glass-stoppered cylinder shake 10 ml for about 1 min with a mixture of 0.5 ml of a 0.35 per cent *V/V* solution of furfural *R* in acetic anhydride *R* and 4.5 ml of acetic anhydride *R*. Filter through a filter paper impregnated with acetic anhydride *R*. To the filtrate add 0.2 ml of sulphuric acid *R*. No bluish-green colour develops.

Water (2.5.32). If intended for use in the manufacture of parenteral dosage forms, not more than 0.1 per cent, determined on 5.0 g by the coulometric method. Use a mixture of equal volumes of decanol *R* and anhydrous methanol *R* as solvent.

STORAGE

Store in a well-filled container, protected from light, at a temperature not exceeding 25 °C. If intended for use in the manufacture of parenteral dosage forms, store under an inert gas.

LABELLING

The label states:

- where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms,
- the name and concentration of any added antioxidant,
- the name of the inert gas.

01/2005:0518

OLIVE OIL, VIRGIN

Olivae oleum virginale

DEFINITION

Virgin olive oil is the fatty oil obtained by cold expression or other suitable mechanical means from the ripe drupes of *Olea europaea* L.

CHARACTERS

A clear, yellow or greenish-yellow, transparent liquid with a characteristic odour, practically insoluble in alcohol, miscible with light petroleum (50 °C to 70 °C).

When cooled, it begins to become cloudy at 10 °C and becomes a butter-like mass at about 0 °C. It has a relative density of about 0.913.

IDENTIFICATION

Carry out the test for identification of fatty oils by thin-layer chromatography (2.3.2). The chromatogram obtained shows spots corresponding to those in the typical chromatogram for olive oil. For certain types of olive oil, the difference in the size of spots E and F is less pronounced than in the typical chromatogram.

TESTS

Acid value (2.5.1). Not more than 2.0, determined on 5.0 g.

Peroxide value (2.5.5, Method A). Not more than 20.0.

Unsaponifiable matter. Not more than 1.5 per cent. Place 5.0 g (*m* g) in a 150 ml flask fitted with a reflux condenser. Add 50 ml of 2 *M* alcoholic potassium hydroxide *R* and heat on a water-bath for 1 h, shaking frequently. Add 50 ml of water *R* through the top of the condenser, shake, allow to cool and transfer the contents of the flask to a separating funnel. Rinse the flask with several portions to a total of 50 ml of light petroleum *R1* and add the rinsings to the separating funnel. Shake vigorously for 1 min. Allow to separate and transfer the aqueous layer to a second separating funnel. If an emulsion forms, add small quantities of alcohol *R* or a concentrated solution of potassium hydroxide *R*. Shake the aqueous layer with 2 quantities, each of 50 ml, of light petroleum *R1*. Combine the light petroleum layers in a third separating funnel and wash with 3 quantities, each of 50 ml, of alcohol (50 per cent *V/V*) *R*. Transfer the light petroleum layer to a tared 250 ml flask. Rinse the separating funnel with small quantities of light petroleum *R1* and add to the flask. Evaporate the light petroleum on a water-bath and dry the residue at 100 °C to 105 °C for 15 min, keeping the flask horizontal. Allow to cool in a desiccator and weigh (*a* g). Repeat the drying for successive periods of 15 min until the loss of mass between 2 successive weighings does not exceed 0.1 per cent. Dissolve the residue in 20 ml of alcohol *R*, previously neutralised to 0.1 ml of bromophenol blue solution *R*. If necessary, titrate with 0.1 *M* hydrochloric acid (*b* ml).

Calculate the percentage content of unsaponifiable matter from the expression:

$$\frac{100(a - 0.032b)}{m}$$

If 0.032*b* is greater than 5 per cent of *a*, the test is invalid and must be repeated.

Absorbance (2.2.25). Dissolve 1.00 g in cyclohexane *R* and dilute to 100.0 ml with the same solvent. The absorbance measured at 270 nm is not greater than 0.20. The ratio of the absorbance at 232 nm to that at 270 nm is greater than 8.

Composition of fatty acids (2.4.22, Method A). The fatty acid fraction of the oil has the following composition:

- saturated fatty acids of chain length less than *C*₁₆: not more than 0.1 per cent,
- palmitic acid: 7.5 per cent to 20.0 per cent,
- palmitoleic acid (equivalent chain length on polyethyleneglycol adipate 16.3): not more than 3.5 per cent,
- stearic acid: 0.5 per cent to 5.0 per cent,
- oleic acid (equivalent chain length on polyethyleneglycol adipate 18.3): 56.0 per cent to 85.0 per cent,

- linoleic acid (equivalent chain length on polyethyleneglycol adipate 18.9): 3.5 per cent to 20.0 per cent,
- linolenic acid (equivalent chain length on polyethyleneglycol adipate 19.7): not more than 1.2 per cent,
- arachidic acid: not more than 0.7 per cent,
- eicosenoic acid (equivalent chain length on polyethyleneglycol adipate 20.3): not more than 0.4 per cent,
- behenic acid: not more than 0.2 per cent,
- lignoceric acid: not more than 0.2 per cent.

Sterols (2.4.23). The sterol fraction of the oil has the following composition:

- sum of contents of β -sitosterol, $\Delta^5,23$ -stigmastadienol, clerosterol, sitostanol, Δ^5 -avenasterol and $\Delta^5,24$ -stigmastadienol: not less than 93.0 per cent,
 - cholesterol: not more than 0.5 per cent,
 - Δ^7 -stigmasterol: not more than 0.5 per cent,
 - campesterol: not more than 4.0 per cent,
- and the content of stigmasterol is not more than that of campesterol.

Sesame oil. In a ground-glass-stoppered cylinder shake 10 ml for about 1 min with a mixture of 0.5 ml of a 0.35 per cent *V/V* solution of furfural *R* in acetic anhydride *R* and 4.5 ml of acetic anhydride *R*. Filter through a filter paper impregnated with acetic anhydride *R*. To the filtrate add 0.2 ml of sulphuric acid *R*. No bluish-green colour develops.

STORAGE

Store in a well-filled container, protected from light, at a temperature not exceeding 25 °C.

01/2005:1457

OLSALAZINE SODIUM

Olsalazinum natricum

$C_{14}H_8N_2Na_2O_6$

M_r 346.2

DEFINITION

Olsalazine sodium contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of disodium 3,3'-diazenediylbis(6-hydroxybenzoate), calculated with reference to the dried and acetate-free substance.

CHARACTERS

A yellow, fine, crystalline powder, sparingly soluble in water, soluble in dimethyl sulphoxide, very slightly soluble in methanol.

It shows polymorphism.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. Dissolve 40.0 mg in 5 ml of 0.1 *M* sodium hydroxide and dilute to 100.0 ml with a 7.8 g/l solution of sodium dihydrogen phosphate *R* adjusted to pH 7.2 with strong sodium hydroxide solution *R* (buffer solution). Dilute

2.0 ml of the solution to 100.0 ml with the buffer solution. Examined between 240 nm and 400 nm (2.2.25), the solution shows absorption maxima at 255 nm and 362 nm. The ratio of the absorbance measured at the maximum at 255 nm to that measured at the maximum at 362 nm is 0.53 to 0.56.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *olsalazine sodium CRS*. If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *methanol R*, evaporate to dryness and record new spectra using the residues.

C. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*.

Test solution. Dissolve 10 mg of the substance to be examined in a mixture of 1 volume of *dilute ammonia R2* and 4 volumes of *alcohol R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dissolve 10 mg of *olsalazine sodium CRS* in a mixture of 1 volume of *dilute ammonia R2* and 4 volumes of *alcohol R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dissolve 5 mg of *sulfasalazine CRS* in reference solution (a) and dilute to 5 ml with reference solution (a).

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 5 volumes of *anhydrous formic acid R*, 50 volumes of *acetone R* and 60 volumes of *methylene chloride R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two separated spots.

D. To 0.5 g of the substance to be examined add 2 ml of *sulphuric acid R*. Progressively heat to ignition and continue heating until an almost white, or at most greyish, residue is obtained. Carry out the ignition at a temperature up to 800 °C. Dissolve the residue in 10 ml of boiling *water R* and filter. 2 ml of the filtrate gives reaction (a) of sodium (2.3.1).

TESTS

Acetate. Not more than 1.0 per cent, determined by liquid chromatography (2.2.29).

Test solution. Dissolve 0.125 g of the substance to be examined in 25.0 ml of *water R* and add 1.0 ml of *dilute hydrochloric acid R*. Centrifuge and then filter the solution through a 0.45 µm filter and also through an appropriate filter for removal of chlorides.

Reference solution (a). Dissolve 0.140 g of *sodium acetate R*, 0.150 g of *sodium formate R* and 0.180 g of *potassium sulphate R* in 100.0 ml of *water R*. Dilute 1.0 ml of this solution to 100.0 ml with *water R*.

Reference solution (b). Use suitable amounts of *sodium acetate R* to prepare not fewer than five reference solutions containing 10 µg/ml to 50 µg/ml of acetate.

The ion-exclusion chromatographic procedure may be carried out using:

- a separation column 0.25 m long and 6 mm in internal diameter packed with *ion-exclusion resin for chromatography R* with a capacity of about 27 meq/column.

- a suppressor column,
- as mobile phase at a flow rate of 0.9 ml/min 0.0001 M *hydrochloric acid*,
- a conductivity detector set at 10 µS·cm⁻¹.

Inject 0.1 ml of reference solution (a). The chromatogram shows three separated peaks. Inject 0.1 ml of the test solution and 0.1 ml of reference solution (b). Prepare a calibration curve from the average of the readings obtained with the reference solutions and determine the concentration of acetate in the test solution from the curve obtained. Measure the peak area for acetate. Calculate the percentage content of acetate content from the following expression:

$$\frac{2.6 \ c}{m}$$

c = concentration of acetate in the test solution (µg/ml), determined by linear interpolation of the standard curve for reference solution (b),

m = mass of sample (mg).

Methanesulphonic acid. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.25 g of the substance to be examined in 20 ml of *water R*, add 1.0 ml of *dilute hydrochloric acid R* and dilute to 25.0 ml with *water R*. Centrifuge and then filter the solution through a 0.45 µm filter and also through an appropriate filter for removal of chloride.

Reference solution (a). Dissolve 0.25 g of *methanesulphonic acid R* in 50 ml of *water R*. Add 0.58 g of *sodium acetate R* and 0.08 g of *sodium chloride R* and dilute to 100.0 ml with *water R*. Dilute 1.0 ml of the solution to 100.0 ml with *water R*.

Reference solution (b). Dissolve 0.10 g of *methanesulphonic acid R* in *water R* and dilute to 100.0 ml with *water R*. Dilute 3.0 ml of the solution to 100.0 ml with *water R*.

The reversed-phase ion chromatographic procedure may be carried out using:

- a pre-column 0.035 m long and 4 mm in internal diameter packed with *reversed-phase ion resin for chromatography R* (10 µm),
- a separation column 0.25 m long and 4 mm in internal diameter packed with *reversed-phase ion resin for chromatography R* (10 µm),
- as mobile phase at a flow rate of 1.0 ml/min, a mixture of 10 volumes of *acetonitrile for chromatography R* and 990 volumes of a solution containing 1.6 g/l of *tetrabutylammonium hydroxide R* and 0.053 g/l of *anhydrous sodium carbonate R*,
- a conductivity detector set at 50 µS·cm⁻¹.

Inject 100 µl of reference solution (a). The test is not valid unless the chromatogram shows 3 separated peaks. Inject 100 µl each of the test solution and reference solution (b). In the chromatogram obtained with the test solution, the area of the peak corresponding to methanesulphonic acid is not greater than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.3 per cent).

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 20.0 mg of the substance to be examined in mobile phase A and dilute to 25.0 ml with mobile phase A.

Reference solution (a). Dilute 0.5 ml of the test solution to 100.0 ml with the mobile phase A.

Reference solution (b). Dissolve 20.0 mg of *olsalazine sodium for performance test CRS* in mobile phase A and dilute to 25.0 ml with mobile phase A.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.125 m long and 4.0 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min, the following linear gradient programme:

Mobile phase A. Dissolve 2.38 g of *tetrabutylammonium hydrogen sulphate R* and 3.6 g of *disodium hydrogen phosphate dihydrate R* in 900 ml of *water R*. Adjust to pH 7.6 with *dilute sodium hydroxide solution R*. Dilute to 1000.0 ml with *water R*. Mix 700 ml of this buffer solution with 300 ml of *methanol R*,

Mobile phase B. Dissolve 4.75 g of *tetrabutylammonium hydrogen sulphate R* and 3.6 g of *disodium hydrogen phosphate dihydrate R* in 900 ml of *water R*. Adjust to pH 7.6 with *dilute sodium hydroxide solution R*. Dilute to 1000.0 ml with *water R*. Mix 350 ml of this buffer solution with 650 ml of *methanol R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 15	55	45	isocratic
15 - 45	55 → 0	45 → 100	linear gradient
45 - 50	0 → 55	100 → 45	return to initial composition
50 - 65	55	45	equilibration

- as detector a spectrophotometer set at 360 nm,

maintaining the temperature of the column at 30 °C.

Inject 20 µl of reference solution (a). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained is at least 50 per cent of the full scale of the recorder.

Inject 20 µl of reference solution (b). The test is not valid unless the chromatogram obtained is similar to the chromatogram obtained with *olsalazine sodium for performance test CRS*. If necessary, adjust the proportion of mobile phase A in the mobile phase (increasing the proportion of mobile phase A increases the retention time).

Inject 20 µl of the test solution. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1 per cent), and not more than one such peak has an area greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than four times the area of the principal peak in the chromatogram obtained with reference solution (a) (2 per cent). Disregard any peak with an area less than 0.05 times that of the principal peak in the chromatogram obtained with reference solution (a) (0.025 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 2.0 per cent, determined on 1.000 g by drying in an oven at 150 °C.

ASSAY

Dissolve 0.100 g in 15 ml of *ethylene glycol R*. Add 40 ml of *dioxan R* and 0.2 ml of a 224 g/l solution of *potassium chloride R*. Titrate with 0.1 M *hydrochloric acid*, determining the end-point potentiometrically (2.2.20). Carry out a blank titration.

Correct the volume consumed for the content of acetate, taking the molecular mass of acetate to be 59.0.

1 ml of 0.1 M *hydrochloric acid* is equivalent to 17.31 mg of C₁₄H₈N₂Na₂O₆.

IMPURITIES

- A. R1 = H, R2 = CO₂H, R3 = OCH₃: 6-hydroxy-6'-methoxy-3,3'-diazenediylidibenzoic acid,
- B. R1 = OH, R2 = CO₂H, R3 = H: 2,6'-dihydroxy-3,3'-diazenediylidibenzoic acid,
- C. R1 = R2 = H, R3 = OH: 2-hydroxy-5-[(4-hydroxyphenyl)diazenyl]benzoic acid,
- D. R1 = H, R2 = CO₂H, R3 = Cl: 6-chloro-6'-hydroxy-3,3'-diazenediylidibenzoic acid,
- E. R1 = H, R2 = CO-CH₂-SO₃H, R3 = OH: 2-hydroxy-5-[[4-hydroxy-3-(sulphoacetyl)phenyl]diazenyl]benzoic acid,

- F. 2'-[(3-carboxy-4-hydroxyphenyl)diazenyl]-4,5'-dihydroxybiphenyl-3,4'-dicarboxylic acid,

- G. 5-[(3-carboxy-4-hydroxyphenyl)diazenyl]-2,4'-dihydroxybiphenyl-3,3'-dicarboxylic acid,

- H. R = CO₂H: 3,3'-[5-carboxy-4-hydroxy-1,3-phenylenebis(diazenediyl)]bis(6-hydroxybenzoic) acid,
- I. R = H: 3,3'-[4-hydroxy-1,3-phenylenebis(diazenediyl)]bis(6-hydroxybenzoic) acid.

OMEGA-3-ACID ETHYL ESTERS 60

Omega-3 acidorum esteri ethylici 60

DEFINITION

Ethyl esters of *alpha*-linolenic acid (C18:3 n-3), moroctic acid (C18:4 n-3), eicosatetraenoic acid (C20:4 n-3), timnodonic (eicosapentaenoic) acid (C20:5 n-3; EPA), heneicosapentaenoic acid (C21:5 n-3), clupanodonic acid (C22:5 n-3) and cervonic (docosahexaenoic) acid (C22:6 n-3; DHA). Omega-3-acid ethyl esters 60 are obtained by transesterification of the body oil of fat fish species coming from families like *Engraulidae*, *Carangidae*, *Clupeidae*, *Osmeridae*, *Salmonidae* and *Scombridae* and subsequent physico-chemical purification processes, including molecular distillation. The minimum content of total omega-3-acid ethyl esters and the minimum content of the omega-3-acids EPA and DHA ethyl esters are indicated in Table 2063-1.

Table 2063-1

Total omega-3-acid ethyl esters	EPA and DHA ethyl esters	EPA ethyl esters	DHA ethyl esters
Minimum content (per cent)			
65	50	25	20
60	50	–	40
55	50	40	–

Tocopherol may be added as an antioxidant.

CHARACTERS

Appearance: light yellow liquid.

It has a slight fish-like odour.

Solubility: practically insoluble in water, very soluble in acetone, in ethanol, in heptane and in methanol.

IDENTIFICATION

- A. Examine the chromatograms obtained in the assay for EPA and DHA ethyl esters.

Results: the peaks due to eicosapentaenoic acid ethyl ester and to docosahexaenoic acid ethyl ester in the chromatogram obtained with the test solution are similar in retention time to the corresponding peaks in the chromatogram obtained with the reference solution.

- B. The substance to be examined complies with the assay for Total omega-3-acid ethyl esters.

TESTS

Absorbance (2.2.25): maximum 0.60 at 233 nm.

Dilute 0.300 g of the substance to be examined to 50.0 ml with *trimethylpentane R*. Dilute 2.0 ml of this solution to 50.0 ml with *trimethylpentane R*.

Acid value (2.5.1): maximum 2.0, determined on 10 g in 50 ml of the prescribed mixture of solvents.

Peroxide value (2.5.5, Method A): maximum 10.0.

Anisidine value: maximum 20.0.

The anisidine value is defined as 100 times the absorbance measured in a 1 cm cell of a solution containing 1 g of the substance to be examined in 100 ml of a mixture of solvents and reagents according to the method described below.

Carry out the operations as rapidly as possible, avoiding exposure to actinic light.

Test solution (a). Dilute 0.500 g of the substance to be examined to 25.0 ml with *trimethylpentane R*.

Test solution (b). To 5.0 ml of test solution (a) add 1.0 ml of a 2.5 g/l solution of *p*-anisidine *R* in *glacial acetic acid R*, shake and protect from light.

Reference solution. To 5.0 ml of *trimethylpentane R* add 1.0 ml of a 2.5 g/l solution of *p*-anisidine *R* in *glacial acetic acid R*, shake and protect from light.

Measure the absorbance (2.2.25) of test solution (a) at 350 nm using *trimethylpentane R1* as the compensation liquid. Measure the absorbance of test solution (b) at 350 nm exactly 10 min after its preparation, using the reference solution as the compensation liquid.

Calculate the anisidine value from the expression:

$$\frac{25 \times (1.2 A_s - A_b)}{m}$$

A_s = absorbance of test solution (b) at 350 nm,

A_b = absorbance of test solution (a) at 350 nm,

m = mass of the substance to be examined in test solution (a), in grams.

Oligomers and partial glycerides. Size exclusion chromatography (2.2.30).

Test solution. Dilute 10.0 mg of the substance to be examined to 10.0 ml with *tetrahydrofuran R*.

Reference solution. In a 100 ml volumetric flask dissolve 50 mg of *monodocosahexaenoin R*, 30 mg of *didocosahexaenoin R* and 20 mg of *tridocosahexaenoin R* in *tetrahydrofuran R* and dilute to 100.0 ml with the same solvent.

Column 1:

– **dimensions:** $l = 0.3$ m, $\varnothing = 7.8$ mm,

– **stationary phase:** *styrene-divinylbenzene copolymer R* (7 μ m), with a pore size of 10 nm.

Columns 2 and 3 placed closest to the injector:

– **dimensions:** $l = 0.3$ m, $\varnothing = 7.8$ mm,

– **stationary phase:** *styrene-divinylbenzene copolymer R* (7 μ m), with a pore size of 50 nm.

Mobile phase: *tetrahydrofuran R*.

Flow rate: 0.8 ml/min.

Detection: differential refractometer.

Injection: 40 μ l.

1. oligomers

2. monoglycerides

3. fatty acid ethyl esters

Figure 2063.2. — Chromatogram for the assay of omega-3-acid ethyl ester in omega-3-acid ethyl esters

System suitability:

01/2005:1250

- *elution order* in the chromatogram obtained with the reference solution: tridocosahexaenoin, didocosahexaenoin and monodocosahexaenoin;
- *resolution* in the chromatogram obtained with the reference solution: minimum of 2.0 between the peaks due to monodocosahexaenoin and to didocosahexaenoin; minimum of 1.0 between the peaks due to didocosahexaenoin and tridocosahexaenoin,
- if the method of standard addition to the test solution is used, the recovery for the added *eicosapentaenoic acid ethyl ester CRS* or *docosahexaenoic acid ethyl ester CRS* is minimum 95 per cent.

Calculate the percentage content of oligomers plus partial glycerides using the following expression:

$$\frac{B}{A} \times 100$$

- A* = sum of areas of all the peaks in the chromatogram,
B = sum of the areas of the peaks with a retention time smaller than those of the ethyl ester peaks.

The ethyl ester peaks, which may be present in the form of an unresolved double peak, are identified as the major peaks in the chromatogram (Figure 2063.-1).

Limit:

- *oligomers + partial glycerides*: maximum 7.0 per cent.

ASSAY

EPA and DHA ethyl esters (2.4.29). See Figure 2063.-2.

Total omega-3-acids ethyl esters (2.4.29). See Figure 2063.-2.

STORAGE

Under an inert gas, in an airtight container, protected from light.

LABELLING

The label states:

- the content of total omega-3-acid ethyl esters,
- the content of EPA ethyl ester and DHA ethyl ester,
- the concentration of any added tocopherol.

OMEGA-3-ACID ETHYL ESTERS 90

Omega-3 acidorum esteri ethylici 90

DEFINITION

Ethyl esters of *alpha*-linolenic acid (C18:3 n-3), morotic acid (C18:4 n-3), eicosatetraenoic acid (C20:4 n-3), timnodonic (eicosapentaenoic) acid (C20:5 n-3; EPA), heneicosapentaenoic acid (C21:5 n-3), clupanodonic acid (C22:5 n-3) and cervonic (docosahexaenoic) acid (C22:6 n-3; DHA). Omega-3-acid ethyl esters are obtained by transesterification of the body oil of fat fish species coming from families such as *Engraulidae*, *Carangidae*, *Clupeidae*, *Osmeridae*, *Salmonidae* and *Scombridae* and subsequent physico-chemical purification processes, including urea fractionation followed by molecular distillation.

Content:

- EPA and DHA ethyl esters: minimum 80 per cent, with minimum 40 per cent of EPA ethyl esters and minimum 34 per cent of DHA ethyl esters,
 - total omega-3-acid ethyl esters: minimum 90 per cent.
- Tocopherol may be added as an antioxidant.

CHARACTERS

Appearance: light yellow liquid.

It has a slight fish-like odour.

Solubility: practically insoluble in water, very soluble in acetone, in ethanol, in heptane and in methanol.

IDENTIFICATION

Examine the chromatograms obtained in the assay for EPA and DHA ethyl esters.

Results: the peaks due to eicosapentaenoic acid ethyl ester and to docosahexaenoic acid ethyl ester in the chromatogram obtained with the test solution are similar in retention time and size to the corresponding peaks in the chromatogram obtained with the reference solution.

TESTS

Absorbance (2.2.25): maximum 0.55 at 233 nm.

Dilute 0.300 g of the substance to be examined to 50.0 ml with *trimethylpentane R*. Dilute 2.0 ml of this solution to 50.0 ml with *trimethylpentane R*.

Acid value (2.5.1): maximum 2.0, determined on 10 g in 50 ml of the prescribed mixture of solvents.

Anisidine value: maximum 20.0.

The anisidine value is defined as 100 times the absorbance measured in a 1 cm cell of a solution containing 1 g of the substance to be examined in 100 ml of a mixture of solvents and reagents according to the method described below.

Carry out the operations as rapidly as possible, avoiding exposure to actinic light.

Test solution (a). Dilute 0.500 g of the substance to be examined to 25.0 ml with *trimethylpentane R*.

Test solution (b). To 5.0 ml of test solution (a) add 1.0 ml of a 2.5 g/l solution of *p-anisidine R* in *glacial acetic acid R*, shake and protect from light.

Reference solution. To 5.0 ml of *trimethylpentane R* add 1.0 ml of a 2.5 g/l solution of *p-anisidine R* in *glacial acetic acid R*, shake and protect from light.

Measure the absorbance (2.2.25) of test solution (a) at 350 nm using *trimethylpentane R1* as the compensation liquid. Measure the absorbance of test solution (b) at 350 nm exactly 10 min after its preparation, using the reference solution as the compensation liquid.

Calculate the anisidine value from the expression:

$$\frac{25 \times (1.2A_s - A_b)}{m}$$

- A_s = absorbance of test solution (b) at 350 nm,
 A_b = absorbance of test solution (a) at 350 nm,
 m = mass of the substance to be examined in test solution (a), in grams.

Peroxide value (2.5.5, *Method A*): maximum 10.0.

Oligomers. Size-exclusion chromatography (2.2.30).

Test solution. Dilute 10.0 mg of the substance to be examined to 10.0 ml with *tetrahydrofuran R*.

Reference solution. Into a 100 ml volumetric flask dissolve 50 mg of *monodocosahexaenoin R*, 30 mg of *didocosahexaenoin R* and 20 mg of *tridocosahexaenoin R* in *tetrahydrofuran R* and dilute to 100.0 ml with the same solvent.

Column 1:

- size: $l = 0.3$ m, $\varnothing = 7.8$ mm,
- stationary phase: *styrene-divinylbenzene copolymer R* (7 μ m) with a pore size of 10 nm.

Columns 2 and 3 placed closest to the injector:

- size: $l = 0.3$ m, $\varnothing = 7.8$ mm,
- stationary phase: *styrene-divinylbenzene copolymer R* (7 μ m) with a pore size of 50 nm.

Mobile phase: *tetrahydrofuran R*.

Flow rate: 0.8 ml/min.

Detection: differential refractometer.

Injection: 40 μ l.

System suitability:

- **elution order** in the chromatogram obtained with the reference solution: tridocosahexaenoin, didocosahexaenoin, monodocosahexaenoin,
- **resolution** in the chromatogram obtained with the reference solution: minimum of 2.0 between the peaks due to monodocosahexaenoin and to didocosahexaenoin and minimum of 1.0 between the peaks due to didocosahexaenoin and to tridocosahexaenoin,
- if the method of standard addition to the test solution is used, the recovery for the added *eicosapentaenoic acid ethyl ester CRS* or *docosahexaenoic acid ethyl ester CRS* is minimum 95 per cent.

Calculate the percentage content of oligomers using the following expression:

$$\frac{B}{A} \times 100$$

- A = sum of areas of all the peaks in the chromatogram,
 B = sum of the areas of the peaks with a retention time smaller than those of the ethyl ester peaks.

The ethyl ester peaks, which may be present in the form of an unresolved double peak, are identified as the major peaks in the chromatogram (Figure 1250-1).

Limit:

- **oligomers:** maximum 1.0 per cent.

Figure 1250-1. – Chromatogram of the test for oligomers in omega-3-acid ethyl esters 90

ASSAY

EPA and DHA ethyl esters (2.4.29). See Figure 1250-2.

Total omega-3-acid ethyl esters (2.4.29). See Figure 1250-2.

STORAGE

Under an inert gas, in an airtight container, protected from light.

LABELLING

The label states the concentration of any added tocopherol.

Figure 1250.-2. - Chromatogram for the assay of total omega-3-acid ethyl esters in omega-3-acid ethyl esters 90

01/2005:1352 — total omega-3 acids, expressed as triglycerides: minimum 60.0 per cent.

Tocopherol may be added as an antioxidant.

OMEGA-3-ACID TRIGLYCERIDES

Omega-3 acidorum triglycerida

DEFINITION

Mixture of mono-, di- and triesters of omega-3 acids with glycerol containing mainly triesters and obtained either by esterification of concentrated and purified omega-3 acids with glycerol or by transesterification of the omega-3 acid ethyl esters with glycerol. The origin of the omega-3 acids is the body oil from fatty fish species coming from families like *Engraulidae*, *Carangidae*, *Clupeidae*, *Osmeridae*, *Salmonidae* and *Scombridae*. The omega-3 acids are identified as the following acids: alpha-linolenic acid (C18:3 n-3), moroctic acid (C18:4 n-3), eicosatetraenoic acid (C20:4 n-3), timnodonic (eicosapentaenoic) acid (C20:5 n-3; EPA), heneicosapentaenoic acid (C21:5 n-3), clupanodonic acid (C22:5 n-3) and cervonic (docosahexaenoic) acid (C22:6 n-3; DHA).

Content:

- sum of the contents of the omega-3 acids EPA and DHA, expressed as triglycerides: minimum 45.0 per cent,

CHARACTERS

Appearance: pale yellow liquid.

Solubility: practically insoluble in water, very soluble in acetone and in heptane, slightly soluble in ethanol.

IDENTIFICATION

Examine the chromatograms obtained in the assay for EPA and DHA.

Results: the peaks due to eicosapentaenoic acid methyl ester and to docosahexaenoic acid methyl ester in the chromatogram obtained with test solution (b) are similar in retention time and size to the corresponding peaks in the chromatogram obtained with reference solution (a).

TESTS

Absorbance (2.2.25): maximum 0.73 at 233 nm.

Dilute 0.300 g of the substance to be examined to 50.0 ml with *trimethylpentane R*. Dilute 2.0 ml of this solution to 50.0 ml with *trimethylpentane R*.

Acid value (2.5.1): maximum 3.0, determined on 10.0 g in 50 ml of the prescribed mixture of solvents.

Anisidine value: maximum 30.0.

The anisidine value is defined as 100 times the absorbance measured in a 1 cm cell filled with a solution containing 1 g of the substance to be examined in 100 ml of a mixture of solvents and reagents according to the method described below.

Carry out the operations as rapidly as possible, avoiding exposure to actinic light.

Test solution (a). Dilute 0.500 g of the substance to be examined to 25.0 ml with *trimethylpentane R*.

Test solution (b). To 5.0 ml of test solution (a) add 1.0 ml of a 2.5 g/l solution of *p-anisidine R* in *glacial acetic acid R*, shake and store protected from light.

Reference solution. To 5.0 ml of *trimethylpentane R* add 1.0 ml of a 2.5 g/l solution of *p-anisidine R* in *glacial acetic acid R*, shake and store protected from light.

Measure the absorbance (2.2.25) of test solution (a) at 350 nm using *trimethylpentane R* as the compensation liquid. Measure the absorbance of test solution (b) at 350 nm exactly 10 min after its preparation, using the reference solution as the compensation liquid.

Calculate the anisidine value from the expression:

$$\frac{25 \times (1.2A_s - A_b)}{m}$$

A_s = absorbance of test solution (b),

A_b = absorbance of test solution (a),

m = mass of the substance to be examined in test solution (a), in grams.

Peroxide value (2.5.5, Method A): maximum 10.0.

Oligomers and partial glycerides. Size-exclusion chromatography (2.2.30).

Test solution. Dilute 10.0 mg of the substance to be examined to 10.0 ml with *tetrahydrofuran R*.

Reference solution. In a 100 ml volumetric flask dissolve 50 mg of *monodocosahexaenoin R*, 30 mg of *didocosahexaenoin R* and 20 mg of *tridocosahexaenoin R* in *tetrahydrofuran R* and dilute to 100.0 ml with the same solvent.

Column 1:

- **dimensions:** $l = 0.3$ m, $\varnothing = 7.8$ mm,
- **stationary phase:** *styrene-divinylbenzene copolymer R* (7 μ m) with a pore size of 10 nm.

Columns 2 and 3 placed closest to the injector:

- **dimensions:** $l = 0.3$ m, $\varnothing = 7.8$ mm,
- **stationary phase:** *styrene-divinylbenzene copolymer R* (7 μ m) with a pore size of 50 nm.

Mobile phase: *tetrahydrofuran R*.

Flow rate: 0.8 ml/min.

Detection: differential refractometer.

Injection: 40 μ l.

System suitability: reference solution:

- **elution order:** tridocosahexaenoin, didocosahexaenoin, monodocosahexaenoin,
- **resolution:** minimum of 2.0 between the peaks due to monodocosahexaenoin and to didocosahexaenoin and minimum of 1.0 between the peaks due to didocosahexaenoin and to tridocosahexaenoin.

Figure 1352-1. – Chromatogram of the test for oligomers and partial glycerides in omega-3-acid triglycerides

Figure 1352.-2. – Chromatogram for the assay of total omega-3 acids in omega-3-acid triglycerides

Identify the peaks from the chromatogram (Figure 1352.-1). Calculate the percentage content of oligomers using the following expression:

$$\frac{B}{A} \times 100$$

- A = sum of the areas of all the peaks in the chromatogram,
 B = area of the peak with a retention time smaller than the retention time of the triglyceride peak.

Calculate the percentage content of partial glycerides using the following expression:

$$\frac{C}{A} \times 100$$

- C = (sum of the) area(s) of the peak(s) due to the mono- and diglycerides.

Limits:

- *oligomers*: maximum 3.0 per cent,
- *partial glycerides*: maximum 50.0 per cent.

ASSAY

EPA and DHA (2.4.29). See Figure 1352.-2.

Total omega-3-acids (2.4.29). See Figure 1352.-2.

STORAGE

In an airtight, well-filled container, protected from light, under an inert gas.

LABELLING

The label states the concentration of any added tocopherol.

01/2005:0942

OMEPRAZOLE

Omeprazolium

$C_{17}H_{19}N_3O_3S$

M_r 345.4

DEFINITION

Omeprazole contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 5-methoxy-2-[(*RS*)-[(4-methoxy-3,5-dimethylpyridin-2-yl)methyl]sulphonyl]-1*H*-benzimidazole, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, very slightly soluble in water, soluble in methylene chloride, sparingly soluble in alcohol and in methanol. It dissolves in dilute solutions of alkali hydroxides.

It shows polymorphism.

IDENTIFICATION

First identification: B.

Second identification: A, C.

- A. Dissolve 2.0 mg in 0.1 *M* sodium hydroxide and dilute to 100.0 ml with the same solvent. Examined between 230 nm and 350 nm (2.2.25), the solution shows 2 absorption maxima at 276 nm and 305 nm. The ratio of the absorbance measured at the absorption maximum at 305 nm to that measured at the absorption maximum at 276 nm is 1.6 to 1.8.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with omeprazole CRS. If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in methanol *R*, evaporate to dryness and record new spectra using the residues.
- C. Examine the chromatograms obtained in the test for impurity C. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). Place the plate in a tank saturated with vapour from acetic acid *R*. The spots rapidly turn brown.

TESTS

Solution S. Dissolve 0.50 g in methylene chloride *R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1).

Absorbance (2.2.25). The absorbance of solution S measured at 440 nm is not more than 0.10 (this limit corresponds to 0.035 per cent of impurity F or impurity G).

Impurity C. Examine by thin-layer chromatography (2.2.27), using a TLC silica gel F_{254} plate *R*.

Test solution (a). Dissolve 0.10 g of the substance to be examined in 2.0 ml of a mixture of equal volumes of methanol *R* and methylene chloride *R*.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10 ml with methanol *R*.

Reference solution (a). Dissolve 10 mg of omeprazole CRS in 2.0 ml of methanol *R*.

Reference solution (b). Dilute 1 ml of test solution (a) to 10 ml with a mixture of equal volumes of methanol *R* and methylene chloride *R*. Dilute 1 ml of this solution to 100 ml with a mixture of equal volumes of methanol *R* and methylene chloride *R*.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of 2-propanol *R*, 40 volumes of methylene chloride *R* previously shaken with concentrated ammonia *R* (shake 100 ml of methylene chloride *R* with 30 ml of concentrated ammonia *R* in a separating funnel; allow the layers to separate and use

the lower layer) and 40 volumes of methylene chloride *R*. Allow the plate to dry in air. Examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a) with a higher R_f value than that of the spot due to omeprazole is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.1 per cent).

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 3.0 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dissolve 1.0 mg of omeprazole CRS and 1.0 mg of omeprazole impurity D CRS in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 4 mm in internal diameter packed with octylsilyl silica gel for chromatography *R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 27 volumes of acetonitrile *R* and 73 volumes of a 1.4 g/l solution of disodium hydrogen phosphate *R* previously adjusted to pH 7.6 with phosphoric acid *R*,
- as detector a spectrophotometer set at 280 nm.

When the chromatograms are recorded under the prescribed conditions, the retention time of omeprazole is about 9 min and the relative retention time of impurity D is about 0.8. Inject separately 40 µl of each solution and continue the chromatography for 3 times the retention time of omeprazole. Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with reference solution (b) is at least 15 per cent of the full scale of the recorder. The test is not valid unless in the chromatogram obtained with reference solution (a), the resolution between the peaks due to impurity D and omeprazole is greater than 3. If necessary, adjust the pH of the mobile phase or the concentration of acetonitrile *R*; an increase in the pH will improve the resolution. The area of any peak, apart from the principal peak, in the chromatogram obtained with the test solution is not greater than the area of the peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

Residual solvents. Examine by head-space gas chromatography (2.2.28), using the standard additions method. The content of chloroform is not more than 50 ppm, and the content of methylene chloride is not more than 100 ppm.

The chromatographic procedure may be carried out using:

- a fused-silica column 30 m long and 0.32 mm in internal diameter coated with a 1.8 µm film of cross-linked poly[(cyanopropyl)(phenyl)][dimethyl]siloxane *R*,
- nitrogen for chromatography *R* as the carrier gas,
- a flame-ionisation detector,
- a suitable head-space sampler.

Place 0.50 g of the substance to be examined in a 10 ml vial. Add 4.0 ml of dimethylacetamide *R* and stopper the vial. Equilibrate the vial at 80 °C for 1 h.

Loss on drying (2.2.32): maximum 0.2 per cent, determined on 1.000 g by drying under high vacuum at 60 °C for 4 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 1.100 g in a mixture of 10 ml of *water R* and 40 ml of *alcohol R*. Titrate with 0.5 M sodium hydroxide, determining the end-point potentiometrically (2.2.20).

1 ml of 0.5 M sodium hydroxide is equivalent to 0.1727 g of $C_{17}H_{19}N_3O_3S$.

STORAGE

In an airtight container, protected from light, at a temperature between 2 °C and 8 °C.

IMPURITIES

A. 5-methoxy-1*H*-benzimidazole-2-thiol,

B. R = H, X = SO: 2-[(*RS*)-[(3,5-dimethylpyridin-2-yl)methyl]sulphinyl]-5-methoxy-1*H*-benzimidazole,

C. R = OCH₃, X = S: 5-methoxy-2-[(4-methoxy-3,5-dimethylpyridin-2-yl)methyl]sulphonyl]-1*H*-benzimidazole (ufiprazole),

D. R = OCH₃, X = SO₂: 5-methoxy-2-[(4-methoxy-3,5-dimethylpyridin-2-yl)methyl]sulphonyl]-1*H*-benzimidazole (omeprazole sulphone),

E. 4-methoxy-2-[(*RS*)-(5-methoxy-1*H*-benzimidazol-2-yl)sulphinyl]methyl]-3,5-dimethylpyridine 1-oxide,

F. R = OCH₃, R' = H: 1,3-dimethyl-8-methoxy-12-thioxopyrido[1',2':3,4]imidazo[1,2-*a*]benzimidazol-2(12*H*)-one,

G. R = H, R' = OCH₃: 1,3-dimethyl-9-methoxy-12-thioxopyrido[1',2':3,4]imidazo[1,2-*a*]benzimidazol-2(12*H*)-one.

OMEPRAZOLE SODIUM

Omeprazolum natricum

$C_{17}H_{18}N_3NaO_3S \cdot H_2O$

M_r 385.4

DEFINITION

Omeprazole sodium contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of sodium 5-methoxy-2-[(*RS*)-[(4-methoxy-3,5-dimethylpyridin-2-yl)methyl]sulphinyl]-1*H*-benzimidazole, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white powder, hygroscopic, freely soluble in water and in alcohol, soluble in propylene glycol, very slightly soluble in methylene chloride.

IDENTIFICATION

- Dissolve 2.0 mg in 0.1 M sodium hydroxide and dilute to 100.0 ml with the same solvent. Examined between 230 nm and 350 nm (2.2.25), the solution shows two absorption maxima, at 276 nm and 305 nm. The ratio of the absorbance measured at the maximum at 305 nm to that measured at the maximum at 276 nm is 1.6 to 1.8.
- Examine the chromatograms obtained in the test for omeprazole impurity C. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). Place the plate in a tank saturated with vapour of *acetic acid R*. The spots rapidly turn brown.
- Ignite 1 g and cool. Add 1 ml of *water R* to the residue and neutralise with *hydrochloric acid R*. Filter and dilute the filtrate to 4 ml with *water R*. 0.1 ml of the solution gives reaction (b) of sodium (2.3.1).

TESTS

Solution S. Dissolve 0.50 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution B₆ (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 10.3 to 11.3.

Omeprazole impurity C. Examine by thin-layer chromatography (2.2.27), using *silica gel HF*₂₅₄ *R* as the coating substance.

Test solution (a). Dissolve 0.10 g of the substance to be examined in 2.0 ml of *methanol R*.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10 ml with *methanol R*.

Reference solution (a). Dissolve 9 mg of *omeprazole CRS* in 2.0 ml of *methanol R*.

Reference solution (b). Dilute 1.0 ml of test solution (b) to 100 ml with *methanol R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of 2-propanol *R*, 40 volumes of *methylene chloride R*

previously shaken with *concentrated ammonia R* (shake 100 ml of *methylene chloride R* with 30 ml of *concentrated ammonia R* in a separating funnel, allow the layers to separate and use the lower layer) and 40 volumes of *methylene chloride R*. Allow the plate to dry in air. Examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a) with a higher R_f value than that of the spot corresponding to omeprazole is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.1 per cent).

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 3.0 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dissolve 1.0 mg of *omeprazole CRS* and 1.0 mg of *omeprazole impurity D CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

The chromatography may be carried out using:

- a stainless steel column 0.15 m long and 4 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 27 volumes of *acetonitrile R* and 73 volumes of a 1.4 g/l solution of *disodium hydrogen phosphate R*, previously adjusted to pH 7.6 with *phosphoric acid R*,
- as detector a spectrophotometer set at 280 nm.

When the chromatograms are recorded in the prescribed conditions, the retention time of omeprazole is about 9 min and the relative retention time of omeprazole impurity D is about 0.8. Inject separately 40 µl of each solution and continue the chromatography for three times the retention time of omeprazole. Adjust the sensitivity of the detector so that the height of the principal peak in the chromatogram obtained with reference solution (b) is not less than 15 per cent of the full scale of the recorder. The test is not valid unless in the chromatogram obtained with reference solution (a), the resolution between the peaks corresponding to omeprazole impurity D and omeprazole is greater than 3. If necessary adjust the pH of the mobile phase or the concentration of *acetonitrile R*, an increase in the pH will improve the resolution. The area of any peak apart from the principal peak in the chromatogram obtained with the test solution is not greater than the area of the peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (2.5.12): 4.5 per cent to 10.0 per cent, determined on 0.300 g by the semi-micro determination of water.

ASSAY

Dissolve 0.300 g in 50 ml of *water R*. Titrate with 0.1 M *hydrochloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *hydrochloric acid* corresponds to 36.74 mg of $C_{17}H_{18}N_3NaO_3S$.

STORAGE

Store in an airtight container, protected from light.

IMPURITIES

A. 5-methoxy-1*H*-benzimidazole-2-thiol,

B. R = H, X = SO: 2-[(*RS*)-[(3,5-dimethylpyridin-2-yl)methyl]sulphinyl]-5-methoxy-1*H*-benzimidazole,

C. R = OCH₃, X = S: 5-methoxy-2-[[4-methoxy-3,5-dimethylpyridin-2-yl)methyl]thio]-1*H*-benzimidazole (ufiprazole),

D. R = OCH₃, X = SO₂: 5-methoxy-2-[[4-methoxy-3,5-dimethylpyridin-2-yl)methyl]sulfonyl]-1*H*-benzimidazole (omeprazole-sulphone),

E. 4-methoxy-2-[[(*RS*)-(5-methoxy-1*H*-benzimidazol-2-yl)sulphinyl]methyl]-3,5-dimethylpyridine 1-oxide,

01/2005:2016

ONDANSETRON HYDROCHLORIDE DIHYDRATE

Ondansetroni hydrochloridum dihydricum

$C_{18}H_{20}ClN_3O \cdot 2H_2O$

M_r 365.9

DEFINITION

(3*RS*)-9-Methyl-3-[(2-methyl-1*H*-imidazol-1-yl)methyl]-1,2,3,9-tetrahydro-4*H*-carbazol-4-one hydrochloride dihydrate.

Content: 97.5 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: sparingly soluble in water and in alcohol, soluble in methanol, slightly soluble in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: *ondansetron hydrochloride dihydrate CRS*.

B. It gives reaction (a) of chlorides (2.3.1).

TESTS

Impurity B. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 0.125 g of the substance to be examined in a mixture of 0.5 volumes of *concentrated ammonia R*, 100 volumes of *alcohol R* and 100 volumes of *methanol R*, and dilute to 10.0 ml with the same mixture of solvents.

Reference solution (a). Dissolve 12.5 mg of *ondansetron for TLC system suitability CRS* in a mixture of 0.5 volumes of *concentrated ammonia R*, 100 volumes of *alcohol R* and 100 volumes of *methanol R*, and dilute to 1.0 ml with the same mixture of solvents.

Reference solution (b). Dilute 1 ml of the test solution to 100 ml with a mixture of 0.5 volumes of *concentrated ammonia R*, 100 volumes of *alcohol R* and 100 volumes of *methanol R*. Dilute 4.0 ml to 10.0 ml with a mixture of 0.5 volumes of *concentrated ammonia R*, 100 volumes of *alcohol R* and 100 volumes of *methanol R*.

Plate: TLC silica gel F_{254} plate *R*.

Mobile phase: *concentrated ammonia R*, *methanol R*, *ethyl acetate R*, *methylene chloride R* (2:40:50:90 V/V/V/V).

Application: 20 µl.

Development: over 3/4 of the plate.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

Order of elution: ondansetron, impurity B, impurity A.

System suitability: the chromatogram obtained with reference solution (a) shows 3 clearly separated spots.

Limit:

- **impurity B:** any spot corresponding to impurity B in the chromatogram obtained with the test solution is not more intense than the principal spot in the chromatogram obtained with reference solution (b) (0.4 per cent).

Related substances. Liquid chromatography (2.2.29).

Test solution (a). Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Test solution (b). Dissolve 90.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 10.0 ml to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 2.0 ml of test solution (a) to 100.0 ml with the mobile phase. Dilute 10.0 ml to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 10.0 mg of *imidazole R* and 10.0 mg of *2-methylimidazole R* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml to 100.0 ml with the mobile phase.

Reference solution (c). Dissolve 5.0 mg of *ondansetron for LC system suitability CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (d). Dissolve 5.0 mg of *ondansetron impurity D CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml to 100.0 ml with the mobile phase.

Reference solution (e). Dissolve 90.0 mg of *ondansetron hydrochloride dihydrate CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 10.0 ml to 100.0 ml with the mobile phase.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,

- **stationary phase:** spherical *nitrile silica gel for chromatography R* (5 µm) with a specific surface area of 220 m²/g and a pore size of 8 nm.

Mobile phase: mix 20 volumes of *acetonitrile R* and 80 volumes of a 2.8 g/l solution of *sodium dihydrogen phosphate monohydrate R* previously adjusted to pH 5.4 with a 40 g/l solution of *sodium hydroxide R*.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 216 nm.

Injection: 20 µl; inject test solution (a) and reference solutions (a), (b), (c) and (d).

Run time: 1.5 times the retention time of ondansetron.

Relative retentions with reference to ondansetron (retention time = about 18 min): impurity E = about 0.1; impurity F = about 0.2; impurity C = about 0.4; impurity D = about 0.5; impurity H = about 0.7; impurity A = about 0.8; impurity G = about 0.9.

System suitability:

- **resolution:** minimum of 1.3 between the peak due to impurity E (first peak) and the peak due to impurity F (second peak) in the chromatogram obtained with reference solution (b) and minimum of 2.5 between the peak due to impurity C (first peak) and the peak due to impurity D (second peak) in the chromatogram obtained with reference solution (c).

Limits:

- **correction factor:** for the calculation of contents, multiply the peak area of impurity C by 0.6,
- **impurity C:** not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),
- **impurity D:** not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (0.1 per cent),
- **impurity E:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.2 per cent),
- **impurity F:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.2 per cent),
- **any other impurity:** not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),
- **total:** not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent),
- **disregard limit:** 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.04 per cent).

Water (2.5.12): 9.0 per cent to 10.5 per cent, determined on 0.200 g.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modification.

Injection: test solution (b) and reference solution (e).

Calculate the percentage content of $C_{18}H_{20}ClN_3O$.

STORAGE

Protected from light.

IMPURITIES

- A. (3RS)-3-[(dimethylamino)methyl]-9-methyl-1,2,3,9-tetrahydro-4H-carbazol-4-one,

- B. 6,6'-methylenebis[(3RS)-9-methyl-3-[(2-methyl-1H-imidazol-1-yl)methyl]-1,2,3,9-tetrahydro-4H-carbazol-4-one],

- C. R1 = R2 = H: 9-methyl-1,2,3,9-tetrahydro-4H-carbazol-4-one,
D. R1 + R2 = CH₂: 9-methyl-3-methylene-1,2,3,9-tetrahydro-4H-carbazol-4-one,

- E. R = H: 1H-imidazole,
F. R = CH₃: 2-methyl-1H-imidazole,

- G. R1 = CH₃, R2 = H: (3RS)-3-[(1H-imidazol-1-yl)methyl]-9-methyl-1,2,3,9-tetrahydro-4H-carbazol-4-one (C-demethylondansetron),
H. R1 = H, R2 = CH₃: (3RS)-3-[(2-methyl-1H-imidazol-1-yl)methyl]-1,2,3,9-tetrahydro-4H-carbazol-4-one (N-demethylondansetron).

Content:

- morphine (C₁₇H₁₉NO₃; M_r 285.3): 9.8 per cent to 10.2 per cent (drug dried at 100-105 °C for 4 h),
- codeine (C₁₈H₂₁NO₃; M_r 299.4): minimum 1.0 per cent (drug dried at 100-105 °C for 4 h).

Content adjusted if necessary by adding a suitable excipient or raw opium powder.

CHARACTERS

Appearance: yellowish-brown or dark brown powder.

IDENTIFICATION

- A. Examine under a microscope using a 20 g/l solution of *potassium hydroxide R*. It is seen to consist of granules of latex agglomerated in irregular masses, and of light brown elongated filaments. Some fragments of vessels and rather elongated, refringent crystals are also visible, as well as a smaller number of round pollen grains and fragments of elongated fibres. Hairs of various lengths with sharp points and fragments of epicarp consisting of polygonal cells with thick walls defining a stellate lumen may be present. Examine under a microscope using *glycerol (85 per cent) R*. Particles of excipient and a few grains of starch introduced during the handling of the latex may be seen.

- B. Thin-layer chromatography (2.2.27).

Test solution. Triturate 0.10 g of the drug to be examined with 5 ml of *alcohol (70 per cent V/V) R*, rinse with 3 ml of *alcohol (70 per cent V/V) R*, transfer to a 25 ml conical flask. Heat in a water-bath at 50-60 °C with stirring for 30 min. Cool, filter, wash the filter with *alcohol (70 per cent V/V) R* and dilute the filtrate to 10 ml with the same solvent.

Reference solution. Dissolve 2.0 mg of *papaverine hydrochloride R*, 12.0 mg of *codeine phosphate R*, 12.0 mg of *noscaphine hydrochloride R* and 25.0 mg of *morphine hydrochloride R* in *alcohol (70 per cent V/V) R* and dilute to 25.0 ml with the same solvent.

Plate: TLC silica gel G plate R.

Mobile phase: concentrated ammonia R, alcohol R, acetone R, toluene R (2:6:40:40 V/V/V/V).

Application: 20 µl, as bands of 20 mm by 3 mm.

Development: over a path of 15 cm.

Drying: at 100-105 °C for 15 min.

Detection: allow to cool and spray with *potassium iodobismuthate solution R2* and then with a 4 g/l solution of *sulphuric acid R*, examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, a dark red zone (thebaine) situated between the codeine zone and the papaverine zone may be present in the chromatogram obtained with the test solution.

Top of the plate	
Noscaphine: an orange-red or red zone	An orange-red or red zone (noscaphine)
Papaverine: an orange-red or red zone	An orange-red or red zone (papaverine)
Codeine: an orange-red or red zone	An orange-red or red zone (codeine)
Morphine: an orange-red or red zone	An orange-red or red zone (morphine)
Reference solution	Test solution

01/2005:1840

OPIUM, PREPARED

Opii pulvis normatus

DEFINITION

Raw opium powdered (180), and dried at a temperature not exceeding 70 °C.

C. To 1.0 g of the drug to be examined add 5 ml of *water R*, shake for 5 min and filter. To the filtrate add 0.25 ml of *ferric chloride solution R2*. A red colour develops which does not disappear on the addition of 0.5 ml of *dilute hydrochloric acid R*.

TESTS

Thebaine. Liquid chromatography (2.2.29).

Test solution. Suspend 1.00 g of the drug to be examined in 50 ml of *alcohol (50 per cent V/V) R*, mix using sonication for 1 h, allow to cool and dilute to 100.0 ml with the same solvent. Allow to stand. To 10.0 ml of the supernatant liquid, add 5 ml of *ammonium chloride buffer solution pH 9.5 R*, dilute to 25.0 ml with *water R* and mix. Transfer 20.0 ml of the solution to a chromatography column about 0.15 m long and about 30 mm in internal diameter containing 15 g of *kieselguhr for chromatography R*. Allow to stand for 15 min. Elute with 2 quantities, each of 40 ml, of a mixture of 15 volumes of *2-propanol R* and 85 volumes of *methylene chloride R*. Evaporate the eluate to dryness *in vacuo* at 40 °C. Transfer the residue to a volumetric flask with the aid of the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution. Dissolve 25.0 mg of *thebaine R* in the mobile phase and dilute to 25.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Precolumn:

- **size:** $l = 40$ mm, $\varnothing = 4.6$ mm,
- **stationary phase:** *octylsilyl silica gel for chromatography R* (5 μ m).

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** *octylsilyl silica gel for chromatography R* (5 μ m).

Mobile phase: dissolve 1.0 g of *sodium heptanesulphonate monohydrate R* in 420 ml of *water R*, adjust to pH 3.2 with phosphoric acid (4.9 g/l H_3PO_4) (about 5 ml) and add 180 ml of *acetonitrile R*.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 280 nm.

Injection: a suitable volume with a loop injector.

System suitability: reference solution:

- **mass distribution ratio:** minimum 3.0 for the peak due to thebaine.

Calculate the percentage content of alkaloid from the expression:

$$\frac{m_1 \times A_2 \times 125}{m_2 \times A_1} \times \frac{100}{100 - h}$$

- m_1 = mass of the alkaloid in the reference solution, in grams,
- m_2 = mass of the substance to be examined in the test solution, in grams,
- A_1 = area of the peak due to the alkaloid in the chromatogram obtained with the reference solution,
- A_2 = area of the peak due to the alkaloid in the chromatogram obtained with the test solution,
- h = percentage loss on drying.

Limit:

- **thebaine:** maximum 3.0 per cent (dried drug).

Loss on drying (2.2.32): maximum 8.0 per cent, determined on 1.000 g by drying in an oven at 100–105 °C for 4 h.

Total ash (2.4.16): maximum 6.0 per cent.

ASSAY

Liquid chromatography (2.2.29) as described in the test for thebaine with the following modifications.

Reference solution. Dissolve 0.100 g of *morphine hydrochloride R* and 25.0 mg of *codeine R* in the mobile phase and dilute to 25.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

System suitability: reference solution:

- **resolution:** minimum 2.5 between the peaks due to morphine and codeine; if necessary, adjust the volume of acetonitrile in the mobile phase,
- **repeatability:** maximum relative standard deviation of 1.0 per cent for the peak area due to morphine, determined on 6 replicate injections.

Calculate the percentage content of morphine and codeine from the expression given in the test for thebaine. For the calculation, 1 mg of *morphine hydrochloride R* is taken to be equivalent to 0.759 mg of morphine and 1 mg of *codeine R* is taken to be equivalent to 0.943 mg of codeine.

LABELLING

The label states the name of any excipient used.

01/2005:0777

OPIUM, RAW

Opium crudum

DEFINITION

Raw opium is intended only as starting material for the manufacture of galenical preparations. It is not dispensed as such.

Raw opium is the air-dried latex obtained by incision from the unripe capsules of *Papaver somniferum* L. It contains not less than 10.0 per cent of morphine ($\text{C}_{17}\text{H}_{19}\text{NO}_3$; M_r 285.3) and not less than 2.0 per cent of codeine ($\text{C}_{18}\text{H}_{21}\text{NO}_3$; M_r 299.4), both calculated with reference to the drug dried at 100 °C to 105 °C.

CHARACTERS

Raw opium has a characteristic odour and a blackish-brown colour. It has the microscopic characters described in identification test A. It consists of masses of various sizes, which tend to be soft and shiny and, after drying, become hard and brittle.

IDENTIFICATION

Strip off any covering, cut the substance to be examined into thin slices, if necessary, dry at about 60 °C for 48 h and reduce to a powder (500).

A. Examined under a microscope, a suspension of raw opium in a 20 g/l solution of *potassium hydroxide R* is seen to consist of granules of latex agglomerated in irregular masses, and of light-brown elongated filaments. Some fragments of vessels and rather elongated, refringent crystals are also visible, as well as a smaller number of round pollen grains and fragments of elongated fibres. Hairs of various lengths with sharp points and a few grains of starch introduced during the handling of the latex may be present. Fragments of epicarp consisting of polygonal cells with thick walls defining a stellate lumen may also be present.

- B. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. Triturate 0.10 g of the powdered drug with 5 ml of *alcohol (70 per cent V/V) R*, add 3 ml of *alcohol (70 per cent V/V) R*, transfer to a 25 ml conical flask and heat in a water-bath at 50 °C to 60 °C with stirring for 30 min. Cool, filter, wash the filter with *alcohol (70 per cent V/V) R* and dilute the filtrate to 10 ml with the same solvent.

Reference solution. Dissolve 2.0 mg of *papaverine hydrochloride R*, 12.0 mg of *codeine phosphate R*, 12.0 mg of *noscipine hydrochloride R* and 25.0 mg of *morphine hydrochloride R* in *alcohol (70 per cent V/V) R* and dilute to 25.0 ml with the same solvent.

Apply separately to the plate as bands 20 mm by 3 mm 20 µl of each solution. Develop over a path of 15 cm using a freshly prepared mixture of 2 volumes of *concentrated ammonia R*, 6 volumes of *alcohol R*, 40 volumes of *acetone R* and 40 volumes of *toluene R*. Dry the plate at 100 °C to 105 °C for 15 min, allow to cool and spray with *potassium iodobismuthate solution R2* and then with a 4 g/l solution of *sulphuric acid R*. The chromatogram obtained with the reference solution shows in the lower part an orange-red or red zone (morphine), above it a similarly coloured zone (codeine) and in the upper part an orange-red or red zone (papaverine) and above it a similarly coloured zone (noscipine). The chromatogram obtained with the test solution shows orange-red or red zones corresponding to those in the chromatogram obtained with the reference solution. The chromatogram obtained with the test solution may also show a dark red zone (thebaine) situated between those due to codeine and to papaverine.

- C. To 1.0 g of the powdered drug add 5 ml of *water R*, shake for 5 min and filter. To the filtrate add 0.25 ml of *ferric chloride solution R2*. A red colour develops which does not disappear on the addition of 0.5 ml of *dilute hydrochloric acid R*.

TESTS

Thebaine. Not more than 3.0 per cent, determined by liquid chromatography (2.2.29) and calculated with reference to the dried drug.

Test solution. Prepare the test solution as described in the assay.

Reference solution. Dissolve 25.0 mg of *thebaine R* in the mobile phase and dilute to 25.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

The chromatographic procedure is carried out as described in the assay. The test is not valid unless the mass distribution ratio for thebaine is at least 3.0 and the number of theoretical plates is at least 3000. Calculate the percentage content of thebaine from the expression given in the assay.

Loss on drying (2.2.32). Not more than 15.0 per cent, determined on 1.000 g of raw opium cut into thin slices, by drying in an oven at 100 °C to 105 °C for 4 h.

Total ash (2.4.16). Not more than 6.0 per cent.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution. Suspend 1.00 g of raw opium, cut into thin slices, in 50 ml of *alcohol (50 per cent V/V) R*, mix with the aid of ultrasound for 1 h, allow to cool and dilute to 100.0 ml with the same solvent. Allow to stand. To 10.0 ml of the supernatant liquid add 5 ml of *ammonium chloride buffer solution pH 9.5 R*, dilute to 25.0 ml with *water R* and mix. Transfer 20.0 ml of the solution to a chromatography column about 0.15 m long and about 30 mm in internal diameter containing 15 g of *kieselguhr for chromatography R*. Allow to stand for 15 min. Elute with two quantities, each of 40 ml, of a mixture of 15 volumes of *2-propanol R* and 85 volumes of *methylene chloride R*. Evaporate the eluate to dryness *in vacuo* at 40 °C. Transfer the residue to a volumetric flask with the aid of the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution. Dissolve 0.100 g of *morphine hydrochloride R* and 25.0 mg of *codeine R* in the mobile phase and dilute to 25.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a column 0.25 m long and 4.6 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 µm), equipped with a guard column 40 mm long and 4.6 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.5 ml/min a solution prepared as follows: dissolve 1.0 g of *sodium heptanesulphonate monohydrate R* in 420 ml of *water R*, adjust to pH 3.2 by addition of phosphoric acid (4.9 g/l H_3PO_4) (about 5 ml) and add 180 ml of *acetonitrile R*,
- as detector a spectrophotometer set at 280 nm,
- an loop injector.

Inject suitable volumes of each solution.

The assay is not valid unless the resolution between the peaks corresponding to morphine and codeine is at least 2.5. If necessary, adjust the volume of acetonitrile in the mobile phase. Inject the reference solution six times. The assay is not valid unless the relative standard deviation of the peak area for morphine is at most 1.0 per cent. Inject alternately the test solution and the reference solution.

Calculate the percentage content of each alkaloid from the expression:

$$\frac{m_1 \times A_2 \times 625}{m_2 \times A_1 \times 5} \times \frac{100}{100 - h}$$

- m_1 = mass in grams of the alkaloid used to prepare the reference solution,
 m_2 = mass in grams of the substance to be examined used to prepare the test solution,
 A_1 = area of the peak corresponding to the alkaloid in the chromatogram obtained with the reference solution,
 A_2 = area of the peak corresponding to the alkaloid in the chromatogram obtained with the test solution,
 h = percentage loss on drying.

For the calculation, 1 mg of *morphine hydrochloride R* is taken to be equivalent to 0.759 mg of morphine and 1 mg of *codeine R* is taken to be equivalent to 0.943 mg of codeine.

STORAGE

Store protected from light.

01/2005:1033

ORCIPRENALINE SULPHATE

Orciprenalini sulfas

C₂₂H₃₆N₂O₁₀SM_r 520.6

DEFINITION

Orciprenaline sulphate contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of di[(RS)-1-(3,5-dihydroxyphenyl)-2-[(1-methylethyl)amino]ethanol] sulphate, calculated with reference to the anhydrous, solvent-free substance.

CHARACTERS

A white, crystalline powder, slightly hygroscopic, freely soluble in water and in alcohol, practically insoluble in methylene chloride.

IDENTIFICATION

First identification: B, E.

Second identification: A, C, D, E.

A. Dissolve 50.0 mg in a 0.04 per cent V/V solution of *hydrochloric acid R* and dilute to 50.0 ml with the same acid solution. Dilute 5.0 ml of the solution to 50.0 ml with a 0.04 per cent V/V solution of *hydrochloric acid R*. Examined between 240 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 278 nm. The specific absorbance at the maximum is 68.5 to 76.0, calculated with reference to the anhydrous and solvent-free substance.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *orciprenaline sulphate CRS*. Examine the substances prepared as discs. If the spectra obtained show differences, dissolve 50 mg of the substance to be examined and the reference substance separately in the minimum volume of *water R* with heating. Add 10 ml of *acetone R* and centrifuge. Dry the precipitate at 40 °C under reduced pressure for 3 h and record new spectra using the residues.

C. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. Dissolve 10 mg of the substance to be examined in *alcohol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *orciprenaline sulphate CRS* in *alcohol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *orciprenaline sulphate CRS* and 10 mg of *salbutamol CRS* in *alcohol R* and dilute to 10 ml with the same solvent.

Apply separately to the plate 2 µl of each solution. Develop over a path of 15 cm using a mixture of 1.5 volumes of *ammonia R*, 10 volumes of *water R* and 90 volumes of *aldehyde-free methanol R*. Allow the plate to dry in air and spray with a 10 g/l solution of *potassium*

permanganate R. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated principal spots.

D. Dissolve about 20 mg in 2 ml of *alcohol R*. Add 2 ml of a 1 g/l solution of *dichloroquinonechlorimide R* in *alcohol R* and 1 ml of *sodium carbonate solution R*. A violet colour is produced, turning to brown.

E. It gives reaction (a) of sulphates (2.3.1).

TESTS

Solution S. Dissolve 2.0 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 4.0 to 5.5.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. Dissolve 0.20 g of the substance to be examined in a mixture of 1 volume of *water R* and 5 volumes of *methanol R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dilute 1 ml of the test solution to 100 ml with a mixture of 1 volume of *water R* and 5 volumes of *methanol R*.

Reference solution (b). Dilute 5 ml of reference solution (a) to 10 ml with a mixture of 1 volume of *water R* and 5 volumes of *methanol R*.

Reference solution (c). Dilute 5 ml of reference solution (a) to 20 ml with a mixture of 1 volume of *water R* and 5 volumes of *methanol R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 4 volumes of *concentrated ammonia R*, 16 volumes of *water R*, 30 volumes of *2-propanol R* and 50 volumes of *ethyl acetate R*. Allow the plate to dry in air. Expose the plate to iodine vapour. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the principal spot in the chromatogram obtained with reference solution (a) (1.0 per cent) and at most one such spot is more intense than the principal spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the spot in the chromatogram obtained with reference solution (c) is clearly visible.

Methanol and 2-propanol. Not more than 0.1 per cent *m/m* of methanol and 0.3 per cent *m/m* of 2-propanol, determined by gas chromatography (2.2.28), using *ethanol R1* as internal standard.

Internal standard solution. Dilute 2 ml of *ethanol R1* to 100 ml with *water R*. Dilute 1 ml of the solution to 10 ml with *water R*.

Test solution (a). Dissolve 1.0 g of the substance to be examined in *water R* and dilute to 10.0 ml with the same solvent.

Test solution (b). Dissolve 1.0 g of the substance to be examined in *water R*, add 1.0 ml of the internal standard solution and dilute to 10.0 ml with *water R*.

Reference solution. Dilute a mixture of 1.0 ml of *methanol R* and 3.0 ml of *2-propanol R* to 100.0 ml with *water R*. Dilute 1.0 ml of the solution to 10.0 ml with *water R*. To 1.0 ml of this solution, add 1.0 ml of the internal standard solution and dilute to 10.0 ml with *water R*.

The chromatographic procedure may be carried out using:

- a glass column 2 m long and 2 mm in internal diameter packed with *ethylvinylbenzene-divinylbenzene copolymer R* (150 µm to 180 µm),
- *nitrogen for chromatography R* as the carrier gas at a flow rate of 30 ml/min,
- a flame-ionisation detector,

maintaining the temperature of the column at 140 °C and that of the injection port and of the detector at 180 °C.

Inject 1 µl of each solution. In the chromatogram obtained with test solution (a), verify that there is no peak with the same retention time as the internal standard. Calculate the content of methanol and 2-propanol taking their density at 20 °C to be 0.792 g/ml and 0.785 g/ml, respectively.

Phenone. Dissolve 0.50 g in a 0.04 per cent V/V solution of *hydrochloric acid R* and dilute to 25.0 ml with the same acid solution. The absorbance (2.2.25) of the solution measured at 328 nm is not greater than 0.16 (0.1 per cent).

Iron (2.4.9). The residue obtained in the test for sulphated ash complies with the limit test for iron (20 ppm). Prepare the standard using *iron standard solution (2 ppm Fe) R*.

Heavy metals. 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (2.5.12). Not more than 2.0 per cent, determined on 1.00 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.400 g in 30 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid* using 0.1 ml of *crystal violet solution R* as indicator.

1 ml of 0.1 M *perchloric acid* is equivalent to 52.06 mg of C₂₂H₃₆N₂O₁₀S.

STORAGE

Store protected from light.

IMPURITIES

- A. 2-(1-methylethyl)-1,2,3,4-tetrahydroisoquinoline-4,6,8-triol,

- B. 1-(3,5-dihydroxyphenyl)-2-[(1-methylethyl)amino]ethanone.

OREGANO

Origani herba

DEFINITION

Dried leaves and flowers separated from the stems of *Origanum onites* L. or *Origanum vulgare* L. subsp. *hirtum* (Link) Ietsw., or a mixture of both species.

Content: minimum 25 ml/kg of essential oil and minimum 1.5 per cent of carvacrol and thymol (both C₁₀H₁₄O; *M_r* 150.2) (anhydrous drug).

CHARACTERS

Macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

A. *O. onites*. The leaf is yellowish-green, usually 4 mm to 22 mm long and 3 mm to 14 mm wide. It has long or short petiole or is sessile. The lamina is ovate, elliptic or ovate-lanceolate. Margins are entire or serrate, apex is acute or obtuse. The veins are yellowish and conspicuous on the adaxial surface. Flowers are solitary or seen as broken parts of the corymb. The calyx is bract-like and inconspicuous. The corolla is white, on top of inflorescences or single flowers, or inconspicuous. The bract is imbricate and green like the leaves. The drug consists yellowish or yellowish-brown stem parts.

O. vulgare (subsp. *hirtum*). The leaf is green and usually 3 mm to 28 mm long and 2.5 mm to 19 mm wide. It is petiolate or sessile. The lamina is ovate or ovate-elliptic. The margins are entire or serrate, the apex is acute or obtuse. Flowers are rare, found as broken parts of the corymbs. Bracts are greenish-yellow and imbricate. Calyx is corolla-like and inconspicuous. Corolla is white on top of inflorescences, slightly conspicuous or inconspicuous.

B. Reduce to a powder (355). The powder is green (*O. vulgare*) to yellowish-green (*O. onites*). Examine under a microscope using *chloral hydrate solution R*. The covering trichomes are of lamiate type or short, unicellular and rarely conical; conical trichomes shaped as pointed teeth are more abundant in *O. vulgare*. Covering trichomes are thick-walled in *O. vulgare*. Covering trichomes contain prismatic crystals in *O. onites*, minute needles in *O. vulgare*. Cuticle on covering trichomes is smooth; warty in *O. vulgare*. The epidermises of the leaves have cells with walls which are sinuous and the stomata are of diacytic type (2.8.3); in *O. vulgare* cells of the upper epidermis are beaded; secretory trichomes with 8-16 cells (12 in *O. vulgare*); glandular trichomes are numerous in *O. onites*; rare in *O. vulgare*. They have unicellular head and unicellular, bicellular or tricellular (bicellular or tricellular in *O. vulgare*) stalk; pollen grains are smooth, spherical and more abundant in *O. onites*.

C. Thin-layer chromatography (2.2.27).

Test solution. To 1.0 g of the powdered drug (355) add 5 ml of *methylene chloride R* and shake for 3 min, filter through about 2 g of *anhydrous sodium sulphate R*.

Reference solution. Dissolve 1 mg of *thymol R* and 10 µl of *carvacrol R* in 10 ml of *methylene chloride R*.

Plate: TLC silica gel plate *R*.

Mobile phase: *methylene chloride R*.

Application: 20 µl, as bands.

Development: over a path of 15 cm.

Drying: in air.

combined upper layers add *anhydrous sodium sulphate R*, shake, filter and evaporate the filtrate, at a temperature not exceeding 50 °C, using a rotary evaporator. Take up the residue with *toluene R* and dilute to 20.0 ml with the same solvent.

Reference solution. Dissolve 30 mg of *orphenadrine citrate CRS* and 30 mg of *orphenadrine impurity E CRS* in 20 ml of *water R*. Add 1 ml of *concentrated ammonia R* and shake with 3 quantities, each of 5 ml, of *toluene R*. To the combined upper layers add *anhydrous sodium sulphate R*, shake, filter and evaporate the filtrate, at a temperature not exceeding 50 °C, using a rotary evaporator. Take up the residue with *toluene R* and dilute to 20.0 ml with the same solvent.

Column:

- *size*: $l = 60$ m, $\varnothing = 0.32$ mm,
- *stationary phase*: *poly(dimethyl)(diphenyl)siloxane R* (film thickness 1.0 μ m).

Carrier gas: *helium for chromatography R*.

Flow rate: 1 ml/min.

Split ratio: 1:25.

Temperature:

- *column*: 240 °C,
- *injection port and detector*: 290 °C.

Detection: flame ionisation.

Injection: 2 μ l.

Run time: 1.3 times the retention time of orphenadrine.

System suitability: reference solution:

- *resolution*: minimum of 1.5 between the peaks due to orphenadrine and to impurity E.

Limits:

- *any impurity*: maximum 0.3 per cent,
- *total*: maximum 1.0 per cent,
- *disregard limit*: 0.02 per cent.

Heavy metals (2.4.8): maximum 10 ppm.

2.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C for 3 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.350 g in 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 46.15 mg of $C_{24}H_{31}NO_8$.

STORAGE

Protected from light. If the substance is sterile, store in a sterile, airtight, tamper-proof container, protected from light.

IMPURITIES

- A. $R_1 = OH$, $R_2 = H$: (*RS*)-(2-methylphenyl)phenylmethanol (2-methylbenzhydrol),

- B. $R_1 + R_2 = O$: (2-methylphenyl)phenylmethanone (2-methylbenzophenone),

- C. $R_1 = O-CH_2-CH_2-NH_2$, $R_2 = H$: (*RS*)-2-[(2-methylphenyl)phenylmethoxy]ethanamine,

- D. $R_1 = R_2 = H$: diphenhydramine,

- E. $R_1 = CH_3$, $R_2 = H$: (*RS*)-*N,N*-dimethyl-2-[(3-methylphenyl)phenylmethoxy]ethanamine (*meta*-methylbenzyl isomer),

- F. $R_1 = H$, $R_2 = CH_3$: (*RS*)-*N,N*-dimethyl-2-[(4-methylphenyl)phenylmethoxy]ethanamine (*para*-methylbenzyl isomer).

01/2005:1760

ORPHENADRINE HYDROCHLORIDE

Orphenadrini hydrochloridum

$C_{18}H_{24}ClNO$

M_r 305.9

DEFINITION

(*RS*)-*N,N*-Dimethyl-2-[(2-methylphenyl)phenylmethoxy]ethanamine hydrochloride.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water and in alcohol.

mp: about 160 °C.

IDENTIFICATION

- A. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: *orphenadrine hydrochloride CRS*.

- B. It gives reaction (a) of chlorides (2.3.1).

TESTS

Appearance of solution. The solution is clear (2.2.1) and its absorbance (2.2.25) at 436 nm has a maximum of 0.050.

Dissolve 0.70 g in *alcohol R* and dilute to 10.0 ml with the same solvent.

Related substances. Gas chromatography (2.2.28): use the normalisation procedure.

Test solution. Dissolve 0.300 g of the substance to be examined in *water R* and dilute to 50 ml with the same solvent. Add 2 ml of *concentrated ammonia R* and shake with 3 quantities, each of 10 ml, of *toluene R*. To the combined upper layers add *anhydrous sodium sulphate R*, shake, filter and evaporate the filtrate, at a temperature not

exceeding 50 °C, using a rotary evaporator. Take up the residue with *toluene R* and dilute to 20.0 ml with the same solvent.

Reference solution. Dissolve 20 mg of *orphenadrine hydrochloride CRS* and 20 mg of *orphenadrine impurity E CRS* in 20 ml of *water R*. Add 1 ml of *concentrated ammonia R* and shake with 3 quantities, each of 5 ml, of *toluene R*. To the combined upper layers add *anhydrous sodium sulphate R*, shake, filter and evaporate the filtrate, at a temperature not exceeding 50 °C, using a rotary evaporator. Take up the residue with *toluene R* and dilute to 20.0 ml with the same solvent.

Column:

- *size*: $l = 60$ m, $\varnothing = 0.32$ mm,
- *stationary phase*: *poly(dimethyl)(diphenyl)siloxane R* (film thickness 1.0 μ m).

Carrier gas: *helium for chromatography R*.

Flow rate: 1 ml/min.

Split ratio: 1:25.

Temperature:

- *column*: 240 °C,
- *injection port and detector*: 290 °C.

Detection: flame ionisation.

Injection: 2 μ l.

Run time: 1.3 times the retention time of orphenadrine.

System suitability: reference solution:

- *resolution*: minimum of 1.5 between the peaks due to orphenadrine and to impurity E.

Limits:

- *any impurity*: maximum 0.3 per cent,
- *total*: maximum 1.0 per cent,
- *disregard limit*: 0.02 per cent.

Heavy metals (2.4.8): maximum 10 ppm.

2.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C for 3 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 50 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 30.59 mg of $C_{18}H_{24}ClNO$.

STORAGE

Protected from light. If the substance is sterile, store in a sterile, airtight, tamper-proof container, protected from light.

IMPURITIES

- A. $R_1 = OH$, $R_2 = H$: (*RS*)-(2-methylphenyl)phenylmethanol (2-methylbenzhydrol),
- B. $R_1 + R_2 = O$: (2-methylphenyl)phenylmethanone (2-methylbenzophenone),

- C. $R_1 = O-CH_2-CH_2-NH_2$, $R_2 = H$: (*RS*)-2-[(2-methylphenyl)phenylmethoxy]ethanamine,

- D. $R_1 = R_2 = H$: diphenhydramine,
- E. $R_1 = CH_3$, $R_2 = H$: (*RS*)-*N,N*-dimethyl-2-[(3-methylphenyl)phenylmethoxy]ethanamine (*meta*-methylbenzyl isomer),
- F. $R_1 = H$, $R_2 = CH_3$: (*RS*)-*N,N*-dimethyl-2-[(4-methylphenyl)phenylmethoxy]ethanamine (*para*-methylbenzyl isomer).

01/2005:0048

OUABAIN

Ouabainum

$C_{29}H_{44}O_{12} \cdot 8H_2O$

M_r 729

DEFINITION

Ouabain contains not less than 96.0 per cent and not more than the equivalent of 104.0 per cent of 3 β -[(6-deoxy- α -L-mannopyranosyl)oxy]-1 β ,5,11 α ,14,19-pentahydroxy-5 β ,14 β -card-20(22)-enolide, calculated with reference to the anhydrous substance.

CHARACTERS

A white, crystalline powder or colourless crystals, sparingly soluble in water and in ethanol, practically insoluble in ethyl acetate.

IDENTIFICATION

- A. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the spot in the chromatogram obtained with reference solution (a).
- B. Dissolve 2 mg to 3 mg in 2 ml of *sulphuric acid R*; a pink colour develops which quickly changes to red. The solution shows green fluorescence in ultraviolet light.
- C. Dissolve about 1 mg in 1 ml of *dinitrobenzene solution R* and add 0.2 ml of *dilute sodium hydroxide solution R*. An intense blue colour develops.
- D. Dissolve 0.1 g in 5 ml of a 150 g/l solution of *sulphuric acid R* and boil for a few minutes. The solution becomes yellow and turbid. Filter and add to the filtrate 5 ml

of a 120 g/l solution of *sodium hydroxide R* and 3 ml of *cupri-tartaric solution R*. Heat. A red precipitate is formed.

TESTS

Solution S. Dissolve 0.20 g in 15 ml of *water R*, heating on a water-bath. Allow to cool and dilute to 20.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Specific optical rotation (2.2.7). –30 to –33, determined on solution S and calculated with reference to the anhydrous substance.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. Dissolve a quantity of the substance to be examined corresponding to 20 mg of the anhydrous substance in 1.0 ml of a mixture of 32 volumes of *water R*, 100 volumes of *chloroform R* and 100 volumes of *methanol R*.

Reference solution (a). Dissolve a quantity of *ouabain CRS* corresponding to 20 mg of the anhydrous substance in 1.0 ml of a mixture of 32 volumes of *water R*, 100 volumes of *chloroform R* and 100 volumes of *methanol R*.

Reference solution (b). Dissolve a quantity of *ouabain CRS* corresponding to 10 mg of the anhydrous substance in a mixture of 32 volumes of *water R*, 100 volumes of *chloroform R*, 100 volumes of *methanol R* and dilute to 25 ml with the same mixture of solvents.

Reference solution (c). Dilute 2.5 ml of reference solution (b) to 10 ml with a mixture of 32 volumes of *water R*, 100 volumes of *chloroform R* and 100 volumes of *methanol R*.

Apply separately to the plate 5 µl of each solution. Develop over a path of 13 cm using a homogeneous mixture of 4 volumes of *water R*, 15 volumes of *methanol R*, 15 volumes of *dimethyl sulphoxide R* and 70 volumes of *chloroform R*. Dry the plate immediately at 140 °C for 30 min in a ventilated drying oven. Allow to cool, spray with *alcoholic sulphuric acid solution R* and heat at 140 °C for 15 min. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (2.0 per cent). The test is not valid unless the principal spot in the chromatogram obtained with reference solution (a) and the principal spot in the chromatogram obtained with the test solution migrate over a distance sufficient to give unequivocal separation of the secondary spots and the spot in the chromatogram obtained with reference solution (c) is clearly visible.

Alkaloids and strophanthin-K. To 5.0 ml of solution S add 0.5 ml of a 100 g/l solution of *tannic acid R*. No precipitate is formed.

Water (2.5.12). 18.0 per cent to 22.0 per cent, determined on 0.100 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 40.0 mg in *alcohol R* and dilute to 50.0 ml with the same solvent. Dilute 5.0 ml of the solution to 100.0 ml with *alcohol R*. Prepare a reference solution in the same manner using 40.0 mg of *ouabain CRS*. To 5.0 ml of each solution add 3.0 ml of *alkaline sodium picrate solution R*, allow to stand protected from bright light for 30 min and measure the absorbance (2.2.25) of each solution at the maximum

at 495 nm using as the compensation liquid a mixture of 5.0 ml of *alcohol R* and 3.0 ml of *alkaline sodium picrate solution R* prepared at the same time.

Calculate the content of $C_{29}H_{44}O_{12}$ from the absorbances measured and the concentrations of the solutions.

STORAGE

Store protected from light.

01/2005:2017

OXALIPLATIN

Oxaliplatinum

$C_8H_{14}N_2O_4Pt$

M_r 397.3

DEFINITION

(*SP-4-2*)-[(1*R*,2*R*)-Cyclohexane-1,2-diamine-κ*N*,κ*N'*][ethanedioato(2-)-κ*O*¹,κ*O*²]platinum.

Content: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: slightly soluble in water, very slightly soluble in methanol, practically insoluble in ethanol.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: *oxaliplatin CRS*.

B. It complies with the test for specific optical rotation (see Tests).

TESTS

Appearance of solution. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Dissolve 0.10 g in *water R* and dilute to 50 ml with the same solvent.

Acidity. Dissolve 0.10 g in *carbon dioxide-free water R*, dilute to 50 ml with the same solvent and add 0.5 ml of *phenolphthalein solution R1*. The solution is colourless. Not more than 0.60 ml of 0.01 *M sodium hydroxide* is required to change the colour of the indicator to pink.

Specific optical rotation (2.2.7): + 74.5 to + 78.0 (dried substance).

Dissolve 0.250 g in *water R* and dilute to 50.0 ml with the same solvent.

Related substances

A. Impurity A. Liquid chromatography (2.2.29). *Use vigorous shaking and very brief sonication to dissolve the substance to be examined. Inject the test solution within 20 min of preparation.*

Test solution. Dissolve 0.100 g of the substance to be examined in *water R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dissolve 14.0 mg of *oxalic acid R* (impurity A) in *water R* and dilute to 250.0 ml with the same solvent.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 200.0 ml with *water R*.

Reference solution (c). Dissolve 12.5 mg of *sodium nitrate R* in *water R* and dilute to 250.0 ml with the same solvent. Dilute a mixture of 2.0 ml of this solution and 25.0 ml of reference solution (a) to 100.0 ml with *water R*.

Column:

- *size:* $l = 25$ cm, $\emptyset = 4.6$ mm,
- *stationary phase:* base-deactivated octadecylsilyl silica gel for chromatography *R* (5 μ m).

Temperature: 40 °C.

Mobile phase: mix 20 volumes of *acetonitrile R* with 80 volumes of a solution prepared as follows: to 10 ml of a 320 g/l solution of *tetrabutylammonium hydroxide R* add 1.36 g of *potassium dihydrogen phosphate R* and dilute to 1000 ml with *water R*; adjust this solution to pH 6.0 with *phosphoric acid R*.

Flow rate: 2 ml/min.

Detection: spectrophotometer at 205 nm.

Injection: 20 μ l; inject the test solution and reference solutions (b) and (c).

Run time: twice the retention time of impurity A.

Retention times: nitrate = about 2.7 min; impurity A = about 4.7 min.

System suitability:

- *resolution:* minimum 9 between the peaks due to nitrate and impurity A in the chromatogram obtained with reference solution (c),
- *signal-to-noise ratio:* minimum of 10 for the peak due to impurity A in the chromatogram obtained with reference solution (b).

Limits:

- *impurity A:* not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

- B. Impurity B. Liquid chromatography (2.2.29). Use vigorous shaking and very brief sonication to dissolve the substance to be examined. Inject the test solution within 20 min of preparation. Use suitable polypropylene containers for the preparation and injection of all solutions. Glass pipettes may be used for diluting solutions.

Test solution. Dissolve 0.100 g of the substance to be examined in *water R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dissolve 12.5 mg of *oxaliplatin impurity B CRS* in 63 ml of *methanol R* and dilute to 250.0 ml with *water R*. Dilute 3.0 ml to 200.0 ml with *water R*.

Reference solution (b). In order to prepare *in situ* the degradation compound (impurity E) dissolve 12.5 mg of *oxaliplatin impurity B CRS* in 63 ml of *methanol R* and dilute to 250 ml with *water R*. Adjust to pH 6.0 with a 0.2 g/l solution of *sodium hydroxide R*. Heat for 4 h at 70 °C and allow to cool.

Column:

- *size:* $l = 25$ cm, $\emptyset = 4.6$ mm,
- *stationary phase:* base-deactivated octadecylsilyl silica gel for chromatography *R* (5 μ m).

Temperature: 40 °C.

Mobile phase: mix 20 volumes of *acetonitrile R* with 80 volumes of a solution prepared as follows: dissolve 1.36 g of *potassium dihydrogen phosphate R* and 1 g of *sodium heptanesulphonate R* in 1000 ml of *water R*; adjust this solution to pH 3.0 ± 0.05 with *phosphoric acid R*.

Flow rate: 2.0 ml/min.

Detection: spectrophotometer at 215 nm.

Injection: 20 μ l.

Run time: 2.5 times the retention time of impurity B.

Retention times: impurity B = about 4.3 min; impurity E = about 6.4 min.

System suitability:

- *resolution:* minimum 7 between the peaks due to impurity B and impurity E in the chromatogram obtained with reference solution (b),
- *signal-to-noise ratio:* minimum of 10 for the peak due to impurity B in the chromatogram obtained with reference solution (a).

Limits:

- *impurity B:* not more than 3.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

- C. Impurity C and other related substances. Liquid chromatography (2.2.29). Use vigorous shaking and very brief sonication to dissolve the substance to be examined. Inject the test solution within 20 min of preparation.

Test solution (a). Dissolve 0.100 g of the substance to be examined in *water R* and dilute to 50.0 ml with the same solvent.

Test solution (b). Dissolve 50.0 mg of the substance to be examined in *water R* and dilute to 500.0 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *oxaliplatin impurity C CRS* and 10 mg of *oxaliplatin CRS* in *water R* and dilute to 100.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with *water R*.

Reference solution (c). Dissolve 5 mg of *dichlorodiaminocyclohexaneplatinum CRS* in *methanol R* and dilute to 50.0 ml with the same solvent. To 10.0 ml of this solution add 10.0 ml of reference solution (a) and dilute to 100.0 ml with *water R*.

Reference solution (d). Dissolve 50.0 mg of *oxaliplatin CRS* in *water R* and dilute to 500.0 ml with the same solvent.

Reference solution (e). Dissolve 5.0 mg of *dichlorodiaminocyclohexaneplatinum CRS* in reference solution (d) and dilute to 50.0 ml with the same solvent.

Reference solution (f). To 0.100 g of the substance to be examined add 1.0 ml of reference solution (a) and dilute to 50.0 ml with *water R*.

Column:

- *size:* $l = 25$ cm, $\emptyset = 4.6$ mm,
- *stationary phase:* octadecylsilyl silica gel for chromatography *R* (5 μ m).

Temperature: 40 °C.

Mobile phase: mixture of solutions A and B (99:1 V/V).

- *solution A:* dilute 0.6 ml of *dilute phosphoric acid R* in 1000 ml of *water R* and adjust to pH 3.0 with either *sodium hydroxide solution R* or *phosphoric acid R*,
- *solution B:* *acetonitrile R*.

Flow rate: 1.2 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 10 μ l; inject test solution (a) and reference solutions (b), (c) and (f).

Run time: 3 times the retention time of oxaliplatin.

Retention times: impurity C = about 4.4 min;
dichlorodiaminocyclohexaneplatinum = about 6.9 min;
oxaliplatin = about 8.0 min.

System suitability:

- **resolution:** minimum 2.0 between the peaks due to dichlorodiaminocyclohexaneplatinum and oxaliplatin in the chromatogram obtained with reference solution (c),
- **signal-to-noise ratio:** minimum 50 for the peak due to impurity C and minimum 10 for the peak due to oxaliplatin in the chromatogram obtained with reference solution (b).

Limits:

- **impurity C:** not more than half the area of the peak due to impurity C in the chromatogram obtained with reference solution (f) (0.1 per cent),
- **any other impurity:** not more than twice the area of the peak due to oxaliplatin in the chromatogram obtained with reference solution (b) (0.1 per cent),
- **total of other impurities:** not more than twice the area of the peak due to oxaliplatin in the chromatogram obtained with reference solution (b) (0.1 per cent),
- **disregard limit:** the area of the peak due to oxaliplatin in the chromatogram obtained with reference solution (b) (0.05 per cent); disregard any peak with a retention time less than 2 min.

D. Total of impurities: the sum of impurities A, B, C and other related impurities is not greater than 0.30 per cent.

Impurity D. Liquid chromatography (2.2.29).

Test solution. Dissolve 30 mg of the substance to be examined in *methanol R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dissolve 5 mg of *oxaliplatin impurity D CRS* in *methanol R* and dilute to 100.0 ml with the same solvent.

Reference solution (b). Dilute 15.0 ml of reference solution (a) to 50.0 ml with *methanol R*.

Reference solution (c). Dissolve 150.0 mg of *oxaliplatin CRS* in *methanol R* and dilute to 200.0 ml with the same solvent.

Reference solution (d). Dilute 5.0 ml of reference solution (c) to 100.0 ml with *methanol R*.

Reference solution (e). To 40 ml of reference solution (c) add 1.0 ml of reference solution (b) and dilute to 50.0 ml with *methanol R*.

Reference solution (f). Mix 4.0 ml of reference solution (a) and 5.0 ml of reference solution (d) and dilute to 50.0 ml with *methanol R*.

Column:

- **size:** $l = 25$ cm, $\varnothing = 4.6$ mm,
- **stationary phase:** *silica gel OC for chiral separations R*.

Temperature: 40 °C.

Mobile phase: *ethanol R*, *methanol R* (3:7 V/V).

Flow rate: 0.3 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 µl; inject the test solution and reference solutions (e) and (f).

Run time: twice the retention time of oxaliplatin.

Retention times: oxaliplatin = about 14 min;
impurity D = about 16 min.

System suitability:

- **resolution:** minimum 1.5 between the peaks due to oxaliplatin and impurity D in the chromatogram obtained with reference solution (f),

- **signal-to-noise ratio:** minimum 10 for the peak due to impurity D in the chromatogram obtained with reference solution (e).

Limits:

- **impurity D:** not more than twice the peak height of the corresponding peak in the chromatogram obtained with reference solution (e) (0.1 per cent).

Silver: maximum 5 ppm.

Atomic absorption spectrometry (2.2.23, *Method II*).

Test solution. Dissolve 0.1000 g of the substance to be examined in *water R* and dilute to 50.0 ml with the same solvent. Dilute 20 µl of this solution to 40 µl with 0.5 M *nitric acid*.

Reference solution (a). Dilute a solution of *silver nitrate R* containing 1000 ppm of silver in 0.5 M *nitric acid* with 0.5 M *nitric acid* to obtain a solution which contains 10 ppb of silver.

Reference solution (b). Mix 20 µl of the test solution and 8 µl of reference solution (a) and dilute to 40 µl with 0.5 M *nitric acid*.

Reference solution (c). Mix 20 µl of the test solution and 16 µl of reference solution (a) and dilute to 40 µl with 0.5 M *nitric acid*.

Source: silver hollow-cathode lamp.

Wavelength: 328.1 nm.

Atomisation device: furnace.

Measure the absorbance of the test solution and reference solutions (b) and (c).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C for 2 h.

Bacterial endotoxins (2.6.14): less than 1.0 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (2.2.29) as described in the test for impurity C and other related substances with the following modifications.

Injection: 20 µl; inject test solution (b) and reference solutions (d) and (e).

System suitability:

- **resolution:** minimum 2.0 between the peaks due to dichlorodiaminocyclohexaneplatinum and oxaliplatin in the chromatogram obtained with reference solution (e),
- **repeatability:** reference solution (d).

Calculate the percentage content of oxaliplatin using the chromatogram obtained with reference solution (d).

LABELLING

The label states where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

Specified impurities: A, B, C, D.

Other detectable impurities: E.

A. ethanedioic acid (oxalic acid),

- B. (SP-4-2)-diaqua[(1R,2R)-cyclohexane-1,2-diamine-κN, κN']platinum (diaquodiaminocyclohexaneplatinum),

- C. (OC-6-33)-[(1R,2R)-cyclohexane-1,2-diamine-κN, κN']ethanedioato(2-)-κO', κO'' dihydroxyplatinum,

- D. (SP-4-2)-[(1S,2S)-cyclohexane-1,2-diamine-κN, κN']ethanedioato(2-)-κO', κO'' platinum (S,S-enantiomer of oxaliplatin),

- E. (SP-4-2)-di-μ-oxobis[(1R,2R)-cyclohexane-1,2-diamine-κN, κN']diplatinum (diaquodiaminocyclohexaneplatinum dimer).

01/2005:0778

OXAZEPAM

Oxazepamum

C₁₅H₁₁ClN₂O₂M_r 286.7

DEFINITION

Oxazepam contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (3RS)-7-chloro-3-hydroxy-5-phenyl-1,3-dihydro-2H-1,4-benzodiazepin-2-one, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, slightly soluble in alcohol and in methylene chloride.

IDENTIFICATION

First identification: B, C.

Second identification: A, C, D.

A. Prepare the solutions immediately before use, protected from light. Dissolve 20.0 mg in alcohol R and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml of

the solution to 50.0 ml with alcohol R (solution A). Dilute 10.0 ml of solution A to 100.0 ml with alcohol R (solution B). Examined between 300 nm and 350 nm (2.2.25), solution A shows an absorption maximum at 316 nm. Examined between 220 nm and 250 nm, solution B shows an absorption maximum at 229 nm. The specific absorbance at the maximum at 229 nm is 1220 to 1300.

- B. Examine by infrared absorption spectrophotometry (2.2.24) comparing with the spectrum obtained with oxazepam CRS. Examine the substances prepared as discs.
- C. Examine the chromatograms obtained in the test for related substances in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).
- D. Dissolve about 20 mg in a mixture of 5 ml of hydrochloric acid R and 10 ml of water R. Heat to boiling for 5 min and cool. Add 2 ml of a 1 g/l solution of sodium nitrite R and allow to stand for 1 min. Add 1 ml of a 5 g/l solution of sulphamic acid R, mix and allow to stand for 1 min. Add 1 ml of a 1 g/l solution of naphthylethylenediamine dihydrochloride R. A red colour develops.

TESTS

Related substances. Carry out the test protected from light. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm. Before use, wash the plate with methanol R until the solvent front has migrated at least 17 cm. Allow the plate to dry in air and heat at 100 °C to 105 °C for 30 min.

Test solution (a). Dissolve 50 mg of the substance to be examined in acetone R and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 2 ml of test solution (a) to 10 ml with acetone R.

Reference solution (a). Dissolve 10 mg of oxazepam CRS in acetone R and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of oxazepam CRS and 10 mg of bromazepam CRS in acetone R and dilute to 10 ml with the same solvent.

Reference solution (c). Dilute 1 ml of test solution (b) to 100 ml with acetone R.

Reference solution (d). Dilute 5 ml of reference solution (c) to 10 ml with acetone R.

Apply separately to the plate 20 µl of each solution. Develop over a path of 15 cm, in the same direction as the washing with methanol R, using a mixture of 10 volumes of methanol R and 100 volumes of methylene chloride R. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (c) (0.2 per cent) and at most one such spot is more intense than the spot in the chromatogram obtained with reference solution (d) (0.1 per cent). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C at a pressure not exceeding 0.7 kPa.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in a mixture of 10 ml of *anhydrous acetic acid R* and 90 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid* determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 28.67 mg of $C_{15}H_{11}ClN_2O_2$.

STORAGE

Store protected from light.

01/2005:1761

OXELADIN HYDROGEN CITRATE

Oxeladini hydrogenocitras

DEFINITION

2-[2-(Diethylamino)ethoxy]ethyl 2-ethyl-2-phenylbutanoate dihydrogen 2-hydroxypropane-1,2,3-tricarboxylate.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water, slightly to very slightly soluble in ethyl acetate.

It shows polymorphism.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: oxeladin hydrogen citrate CRS.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *anhydrous ethanol R*, evaporate to dryness and record new spectra using the residues.

TESTS

Appearance of solution. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, Method II).

Dissolve 2.0 g in *water R* and dilute to 10.0 ml with the same solvent.

Related substances. Gas chromatography (2.2.28): use the normalisation procedure. *Prepare the solutions immediately before use.*

Test solution. Dissolve 0.500 g of the substance to be examined in *water R* and dilute to 50 ml with the same solvent. Add 1 ml of a 10.3 g/l solution of *hydrochloric acid R* and shake with 3 quantities, each of 10 ml, of *methylene chloride R*. Combine the lower layers. Add 5 ml of *concentrated ammonia R* to the aqueous layer and shake with 3 quantities, each of 10 ml, of *methylene chloride R*. Combine the lower layers obtained to the lower layers obtained previously, add *anhydrous sodium sulphate R*, shake, filter and evaporate the filtrate, at a temperature not exceeding 30 °C, using a rotary evaporator. Take up the residue with *methylene chloride R* and dilute to 20.0 ml with the same solvent.

Reference solution (a). Dissolve 5 mg of *oxeladin impurity D CRS* in 10 ml of *water R*, add 0.5 ml of *concentrated ammonia R* and shake with 3 quantities, each of 2 ml, of *methylene chloride R*. To the combined lower layers, add 0.2 ml of the test solution and dilute to 10.0 ml with *methylene chloride R*.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *methylene chloride R*. Dilute 1.0 ml of this solution to 20.0 ml with *methylene chloride R*.

Reference solution (c). Dissolve 5 mg of *oxeladin impurity C CRS* in 10 ml of *water R*, add 0.5 ml of *concentrated ammonia R* and shake with 3 quantities, each of 2 ml, of *methylene chloride R*. Combine the lower layers and dilute to 10 ml with *methylene chloride R*.

Column:

- *material*: fused silica,
- *size*: $l = 25$ m, $\varnothing = 0.32$ mm,
- *stationary phase*: poly(dimethyl)(diphenyl)siloxane *R* (film thickness 0.4 µm).

Carrier gas: helium for chromatography *R*.

Flow rate: 1.0 ml/min. Adjust the flow rate if necessary to obtain a retention time of about 13 min for oxeladin.

Split ratio: 1:15.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 4	160
	4 - 12	160 → 240
	12 - 21	240
	21 - 30	240 → 160
Injection port		280
Detector		280

Detection: flame ionisation.

Injection: 1 µl.

Relative retention with reference to oxeladin (retention time = about 13 min): impurity A = about 0.2; impurity B = about 0.4; impurity C = about 0.8; impurity D = about 0.9.

System suitability: reference solution (a):

- *resolution*: minimum 10 between the peaks due to impurity D and oxeladin.

Limits:

- *impurity C*: maximum 0.2 per cent,
- *impurity D*: maximum 0.3 per cent,
- *any other impurity*: for each impurity, maximum 0.1 per cent,
- *total*: maximum 1.0 per cent,
- *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C for 3 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.400 g in 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 52.76 mg of $C_{26}H_{41}NO_{10}$.

IMPURITIES

Specified impurities: C, D.

Other detectable impurities: A, B.

A. 2-[2-(diethylamino)ethoxy]ethanol,

B. R1 = C₂H₅, R2 = H: 2-ethyl-2-phenylbutanoic acid,

C. R1 = C₂H₅, R2 = [CH₂]₂-N(C₂H₅)₂: 2-(diethylamino)ethyl 2-ethyl-2-phenylbutanoate,

D. R1 = H, R2 = [CH₂]₂-O-[CH₂]₂-N(C₂H₅)₂: 2-[2-(diethylamino)ethoxy]ethyl (2*RS*)-2-phenylbutanoate.

01/2005:1458

OXFENDAZOLE FOR VETERINARY USE

Oxfendazolum ad usum veterinarium

C₁₅H₁₃N₃O₃S

*M*_r 315.4

DEFINITION

Methyl [5-(phenylsulphonyl)-1*H*-benzimidazol-2-yl]carbamate.

Content: 97.5 per cent to 100.5 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, slightly soluble in alcohol and in methylene chloride.

It shows polymorphism.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: oxfendazole CRS.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *alcohol R*, evaporate to dryness and record new spectra using the residues.

TESTS

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). To 10 ml of the test solution, add 0.25 ml of *strong hydrogen peroxide solution R* and dilute to 25 ml with the mobile phase.

Reference solution (c). Dissolve 5.0 mg of *fenbendazole CRS* and 10.0 mg of *oxfendazole impurity B CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml to 20.0 ml with the mobile phase.

Reference solution (d). Dissolve 5 mg of *oxfendazole with impurity D CRS* in the mobile phase and dilute to 20 ml with the mobile phase (solution used for identification of impurity D).

Column:

- *size*: *l* = 0.25 m, Ø = 4.6 mm,
- *stationary phase*: spherical *end-capped octadecylsilyl silica gel for chromatography R* (5 µm) with a specific surface area of 350 m²/g, a pore size of 10 nm and a carbon loading of 14 per cent.

Mobile phase: mix 36 volumes of *acetonitrile R* and 64 volumes of a 2 g/l solution of *sodium pentanesulphonate R* adjusted to pH 2.7 with a 2.8 per cent V/V solution of *sulphuric acid R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 µl.

Run time: 4 times the retention time of oxfendazole.

Retention time: oxfendazole = about 6.5 min.

System suitability: reference solution (b):

- *resolution*: minimum 4.0 between the 2 principal peaks corresponding to impurity C (1st peak) and oxfendazole (2nd peak).

Limits:

- *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (1.0 per cent),
- *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (2.0 per cent),
- *impurity C or D*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent),
- *any other impurity*: not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- *total*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (3.0 per cent),
- *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C at a pressure not exceeding 0.7 kPa for 2 h.

Sulphated ash (2.4.14): maximum 0.2 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 3 ml of *anhydrous formic acid R*. Add 40 ml of *anhydrous acetic acid R*. Titrate with 0.1 *M perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 *M perchloric acid* is equivalent to 31.54 mg of C₁₅H₁₃N₃O₃S.

STORAGE

Protected from light.

IMPURITIES

A. fenbendazole,

B. X = SO₂, R = CO₂-CH₃: methyl [5-(phenylsulphonyl)-1H-benzimidazol-2-yl]carbamate,

C. X = SO, R = H: 5-(phenylsulphinyl)-1H-benzimidazol-2-amine,

D. N,N'-bis[5-(phenylsulphonyl)-1H-benzimidazol-2-yl]urea.

01/2005:1353

OXOLINIC ACID

Acidum oxolinicum

C₁₃H₁₁NO₅M_r 261.2

DEFINITION

Oxolinic acid contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of 5-ethyl-8-oxo-5,8-dihydro-1,3-dioxolo[4,5-g]quinoline-7-carboxylic acid, calculated with reference to the dried substance.

CHARACTERS

An almost white or pale yellow, crystalline powder, practically insoluble in water, very slightly soluble in methylene chloride, practically insoluble in alcohol. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: B.

Second identification: A, C.

A. Dissolve 25.0 mg in 5 ml of 0.1 M sodium hydroxide, heating on a water-bath. Allow to cool and dilute to 100.0 ml with methanol R. Dilute 2.0 ml of the solution to 100.0 ml with 0.1 M hydrochloric acid. Examined between 220 nm and 350 nm (2.2.25), the solution shows three absorption maxima, at 260 nm, 322 nm and 336 nm respectively. The ratio of the absorbance measured at the maximum at 260 nm to that measured at the maximum at 336 nm is 4.9 to 5.2.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with oxolinic acid CRS. Examine the substances prepared as discs.

C. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution. Dissolve 10 mg of the substance to be examined in 3 ml of dilute sodium hydroxide solution R and dilute to 20 ml with alcohol R.

Reference solution (a). Dissolve 10 mg of oxolinic acid CRS in 3 ml of dilute sodium hydroxide solution R and dilute to 20 ml with alcohol R.

Reference solution (b). Dissolve 5 mg of ciprofloxacin hydrochloride CRS in methanol R and dilute to 10 ml with the same solvent. Dilute 1 ml of the solution to 2 ml with reference solution (a).

Apply separately to the plate 10 µl of each solution. At the bottom of a chromatographic tank, place an evaporating disk containing 50 ml of concentrated ammonia R. Close the tank and expose the plate to the ammonia vapour for 15 min. Withdraw the plate and transfer to a chromatographic tank and develop over a path of 15 cm using a mixture of 10 volumes of acetonitrile R, 20 volumes of concentrated ammonia R, 40 volumes of methanol R and 40 volumes of methylene chloride R. Allow the plate to dry in air. Examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position, fluorescence and size to the principal spot in the chromatogram obtained with reference solution (a). The identification is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

TESTS

Solution S. Dissolve 0.6 g in 20 ml of a 40 g/l solution of sodium hydroxide R.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution B₇ (2.2.2, Method II).

Related substances. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable cellulose with a particle size of narrow distribution.

Test solution. Dissolve 50 mg in 3 ml of dilute sodium hydroxide solution R and dilute to 10 ml with alcohol R.

Reference solution (a). Dilute 1 ml of the test solution to 50.0 ml with alcohol R. Dilute 1.0 ml of the solution to 5.0 ml with alcohol R.

Reference solution (b). Dissolve 2 mg of oxolinic acid impurity B CRS in alcohol R and dilute to 10 ml with the same solvent. Dilute 0.5 ml of the solution to 10 ml with alcohol R.

Reference solution (c). Dissolve 5 mg of the substance to be examined and 5 mg of oxolinic acid impurity A CRS in 2 ml of dilute sodium hydroxide solution R and dilute to 40 ml with alcohol R.

Apply separately to the plate 5 µl of each solution, in sufficiently small portions to obtain small spots. Develop over a path of 6 cm (corresponding to two thirds of the plate height) with a mixture of 15 volumes of ammonia R, 30 volumes of water R and 55 volumes of propanol R. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. In the chromatogram obtained with the test solution: any spot corresponding to oxolinic acid impurity B is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent); any spot apart from the principal spot and any spot corresponding to oxolinic acid impurity B is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.4 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated principal spots.

Heavy metals (2.4.8). 2.0 g complies with limit test D for heavy metals (10 ppm). Prepare the standard using 2 ml of lead standard solution (10 ppm Pb) R.

Loss on drying (2.2.32). Not more than 0.5 per cent determined on 1.000 g by heating in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 150 ml of *dimethylformamide R*. Titrate with 0.1 M *tetrabutylammonium hydroxide*, determining the end-point potentiometrically (2.2.20). Use a glass indicator electrode and a calomel reference electrode containing, as the electrolyte, a saturated solution of *potassium chloride R* in *methanol R*. Carry out a blank titration.

1 ml of 0.1 M *tetrabutylammonium hydroxide* is equivalent to 26.12 mg of $C_{13}H_{11}NO_5$.

STORAGE

Store protected from light.

IMPURITIES

A. 8-hydroxy-1,3-dioxolo[4,5-*g*]quinoline-7-carboxylic acid,

B. R1 = R2 = C_2H_5 : ethyl 5-ethyl-8-oxo-5,8-dihydro-1,3-dioxolo[4,5-*g*]quinoline-7-carboxylate,

C. R1 = CH_3 , R2 = H: 5-methyl-8-oxo-5,8-dihydro-1,3-dioxolo[4,5-*g*]quinoline-7-carboxylic acid.

01/2005:0628

OPXPENOLOL HYDROCHLORIDE

Oxprenololi hydrochloridum

$C_{15}H_{24}ClNO_3$

M_r 301.8

DEFINITION

(2*RS*)-1-[(1-methylethyl)amino]-3-[2-(prop-2-enyloxy)phenoxy]propan-2-ol hydrochloride.

Content: 98.5 per cent to 101.5 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: very soluble in water, freely soluble in alcohol.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. Melting point (2.2.14): 107 °C to 110 °C.

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: *oxprenolol hydrochloride CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *ethyl acetate R*, evaporate to dryness and record new spectra using the residues.

C. Examine the chromatograms obtained in the test for related substances.

Results: the principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 2.0 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution GY₆ (2.2.2, *Method II*).

pH (2.2.3): 4.5 to 6.0 for freshly prepared solution S.

Related substances. Thin-layer chromatography (2.2.27).

Test solution (a). Dissolve 0.10 g of the substance to be examined in 2 ml of a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R*.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R*.

Reference solution (a). Dissolve 10 mg of *oxprenolol hydrochloride CRS* in 2 ml of a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R*.

Reference solution (b). Dilute 0.4 ml of test solution (a) to 100 ml with a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R*.

Reference solution (c). Dilute 5 ml of reference solution (b) to 10 ml with a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R*.

Reference solution (d). Dissolve 5 mg of *alprenolol hydrochloride CRS* in 1 ml of reference solution (a).

Plate: TLC silica gel G plate R.

Mobile phase: concentrated ammonia R, *methanol R*, *methylene chloride R* (2:12:88 V/V/V).

Application: 2 µl; allow the spots to dry in air for 15 min.

Development: over a path of 13 cm.

Drying: in a current of warm air for 10 min.

Detection: allow to cool and spray with *anisaldehyde solution R*. Heat at 100-105 °C for 5-10 min. Examine in daylight.

System suitability: the test is not valid unless the chromatogram obtained with reference solution (d) shows 2 clearly separated spots.

Limits: in the chromatogram obtained with test solution (a):

— **any impurity:** any spot, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.4 per cent); not more than 1 such spot is more intense than the spot in the chromatogram obtained with reference solution (c) (0.2 per cent).

Lead: maximum 5 ppm.

Atomic absorption spectrometry (2.2.23, *Method II*).

Test solution. Dissolve 1.00 g of the substance to be examined in *water R* and dilute to 25.0 ml with the same solvent.

Reference solutions. Prepare the reference solutions using 0.5 ml and 1.0 ml respectively of *lead standard solution* (10 ppm Pb) R diluted to 25.0 ml with *water R*.

Source: lead hollow-cathode lamp.

Wavelength: 217.0 nm.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C for 6 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in a mixture of 5.0 ml of 0.01 M hydrochloric acid and 50 ml of alcohol R. Carry out a potentiometric titration (2.2.20), using 0.1 M sodium hydroxide. Read the volume added between the 2 points of inflexion.

1 ml of 0.1 M sodium hydroxide is equivalent to 30.18 mg of $C_{17}H_{29}ClN_2O_3$.

STORAGE

Protected from light.

01/2005:1251

OXYBUPROCAINE HYDROCHLORIDE

Oxybuprocaini hydrochloridum

$C_{17}H_{29}ClN_2O_3$

M_r 344.9

DEFINITION

Oxybuprocaine hydrochloride contains not less than 98.5 per cent and not more than the equivalent of 101.5 per cent of 2-(diethylamino)ethyl 4-amino-3-butoxybenzoate hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder or colourless crystals, very soluble in water, freely soluble in alcohol.

It shows polymorphism.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. Melting point (2.2.14): 158 °C to 162 °C.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with oxybuprocaine hydrochloride CRS. Examine the substances prepared as discs. If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in methanol R, evaporate to dryness and record the spectra again using the residues.

C. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 40 mg of the substance to be examined in methanol R and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 40 mg of oxybuprocaine hydrochloride CRS in methanol R and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 20 mg of procaine hydrochloride R in reference solution (a) and dilute to 5 ml with the same solution.

Apply separately to the plate 5 µl of each solution. Develop over a path of 10 cm using a mixture of 10 volumes of anhydrous formic acid R, 15 volumes of methanol R, 15 volumes of water R and 60 volumes of ethyl acetate R. Dry the plate in a current of hot air for 10 min and examine in ultraviolet light at 254 nm. Spray with dimethylaminobenzaldehyde solution R7. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

D. Dilute 0.2 ml of solution S (see Tests) to 2 ml with water R. The solution gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 5.0 g in carbon dioxide-free water R and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₅ (2.2.2, Method II).

pH (2.2.3). The pH of solution S is 4.5 to 6.0.

Related substances. Examine by liquid chromatography (2.2.29).

Buffer solution pH 2.5. Add 6 ml of perchloric acid solution R and 12 ml of dilute phosphoric acid R to 950 ml of water R. Adjust the pH to 2.5 with a 40 g/l solution of sodium hydroxide R and dilute to 1000.0 ml with water R.

Test solution. Dissolve 10.0 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 20.0 ml with the mobile phase and dilute 5.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (b). Mix 1.0 ml of the test solution with 1 ml of a 40 g/l solution of sodium hydroxide R and allow to stand for 20 min. Add 1 ml of dilute phosphoric acid R and dilute to 100.0 ml with the mobile phase. Dilute 25 ml to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 3.9 mm in internal diameter packed with octadecylsilyl silica gel for chromatography R1 (5 µm) with a pore size of 10 nm and a carbon loading of 19 per cent,
- as mobile phase at a flow rate of 1 ml/min a mixture of 25 volumes of acetonitrile R and 75 volumes of buffer solution pH 2.5,
- as detector a spectrophotometer set at 309 nm, maintaining the temperature of the column at 35 °C.

When the chromatograms are recorded in the prescribed conditions the retention time is about 9 min for oxybuprocaine hydrochloride. Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with reference solution (a) is at least 50 per cent of the full scale of the recorder.

Inject 20 µl of reference solution (b). The test is not valid unless: in the chromatogram obtained with reference solution (b), the resolution between the main peaks corresponding to oxybuprocaine and oxybuprocaine impurity B (hydrolysis product) is at least twelve.

Inject 20 µl of the test solution and 20 µl of reference solution (a). Continue the chromatography for four times the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent); the sum of the areas of all the peaks apart from the principal peak is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.25 per cent). Disregard any peak with an area less than 0.05 times that of the peak due to oxybuprocaine hydrochloride in the chromatogram obtained with reference solution (a).

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution* (1 ppm Pb) R.

Loss on drying (2.2.32). Not more than 0.5 per cent determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in a mixture of 20 ml of *anhydrous acetic acid* R and 20 ml of *acetic anhydride* R. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 34.49 mg of C₁₇H₂₉ClN₂O₃.

STORAGE

Store protected from light.

IMPURITIES

- A. R = H: 4-aminobenzoic acid,
 B. R = O-CH₂-CH₂-CH₂-CH₃: 4-amino-3-butoxybenzoic acid,
 C. R = OH: 4-amino-3-hydroxybenzoic acid.

01/2005:1354

OXYBUTYNIN HYDROCHLORIDE

Oxybutynini hydrochloridum

C₂₂H₃₂ClNO₃

M_r 394.0

DEFINITION

Oxybutynin hydrochloride contains not less than 99.0 per cent and not more than the equivalent of 102.0 per cent of 4-(diethylamino)but-2-ynyl (RS)-2-cyclohexyl-2-hydroxy-2-phenylacetate hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, freely soluble in water and in alcohol, soluble in acetone, slightly soluble in cyclohexane.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. Melting point (2.2.14): 124 °C to 129 °C.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *oxybutynin hydrochloride CRS*. Examine the substances prepared as discs.

C. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution. Dissolve 50 mg of the substance to be examined in *alcohol R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 10 mg of *oxybutynin hydrochloride CRS* in *alcohol R* and dilute to 2 ml with the same solvent.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm, using *methanol R*. Allow the plate to dry in air, and expose the plate to iodine vapour for 30 min. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

D. It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 2.00 g in *water R* and dilute to 20.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₅ (2.2.2, *Method II*).

Optical rotation (2.2.7). The angle of optical rotation, determined on solution S, is –0.10° to +0.10°.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 50.0 mg of *oxybutynin hydrochloride CRS* and 50.0 mg of *oxybutynin impurity A CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 3.9 mm in internal diameter packed with *octylsilyl silica gel for chromatography R2* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 49 volumes of a solution containing 3.4 g/l of *potassium dihydrogen phosphate R* and 4.36 g/l of *dipotassium hydrogen phosphate R* and 51 volumes of *acetonitrile R*,

– as detector a spectrophotometer set at 210 nm.

Inject 10 µl of reference solution (a). When the chromatograms are recorded in the prescribed conditions the retention times are: oxybutynin hydrochloride about 15 min and impurity A about 24 min. Adjust the sensitivity of the system so that the heights of the peaks in the chromatogram obtained are about 20 per cent of the full scale of the recorder. The test is not valid unless the resolution between the peaks due to oxybutynin hydrochloride and to impurity A is at least 11.0.

Inject 10 µl of the test solution, 10 µl of reference solution (a) and 10 µl of reference solution (b). Continue the chromatography for about twice the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak due to impurity A is not greater than 1.5 times the area of the peak due to impurity A in the chromatogram obtained with reference solution (a) (1.5 per cent); the sum of the areas of all the peaks, apart from the principal peak and the peak due to impurity A, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Disregard any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) *R*.

Loss on drying (2.2.32). Not more than 3.0 per cent determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in a mixture of 5.0 ml of 0.01 *M* hydrochloric acid and 50 ml of alcohol *R*. Carry out a potentiometric titration (2.2.20), using 0.1 *M* sodium hydroxide. Read the volume added between the two points of inflexion.

1 ml of 0.1 *M* sodium hydroxide is equivalent to 39.4 mg of $C_{22}H_{32}ClNO_3$.

STORAGE

Store protected from light.

IMPURITIES

- A. 4-(diethylamino)but-2-ynyl (*RS*)-2-(cyclohex-3-en-1-yl)-2-cyclohexyl-2-hydroxyacetate,

- B. 4-(diethylamino)but-2-ynyl 2-hydroxy-2,2-diphenylacetate (diphenyl analogue of oxybutynin),

- C. $R = CH_3$: 4-(ethylmethylamino)but-2-ynyl (*RS*)-2-cyclohexyl-2-hydroxy-2-phenylacetate (methylethyl analogue of oxybutynin),

- E. $R = CH_2-CH_2-CH_3$: 4-(ethylpropylamino)but-2-ynyl (*RS*)-2-cyclohexyl-2-hydroxy-2-phenylacetate (ethylpropyl analogue of oxybutynin),

- D. (*RS*)-2-cyclohexyl-2-hydroxy-2-phenylacetic acid (phenylcyclohexylglycolic acid).

01/2005:0417

OXYGEN

Oxygenium

O_2

M_r 32.00

DEFINITION

Oxygen contains not less than 99.5 per cent *V/V* of O_2 .

This monograph applies to oxygen for medicinal use.

CHARACTERS

A colourless, odourless gas. At 20 °C and at a pressure of 101 kPa, 1 volume dissolves in about 32 volumes of water.

PRODUCTION

Carbon dioxide. Not more than 300 ppm *V/V*, determined using an infrared analyser (2.5.24).

Gas to be examined. The substance to be examined. It must be filtered to avoid stray light phenomena.

Reference gas (a). Use oxygen *R*.

Reference gas (b). Use a mixture containing 300 ppm *V/V* of carbon dioxide *R1* in nitrogen *R1*.

Calibrate the apparatus and set the sensitivity using reference gases (a) and (b). Measure the content of carbon dioxide in the gas to be examined.

Carbon monoxide. Not more than 5 ppm *V/V*, determined using an infrared analyser (2.5.25).

Gas to be examined. The substance to be examined. It must be filtered to avoid stray light phenomena.

Reference gas (a). Use oxygen *R*.

Reference gas (b). Use a mixture containing 5 ppm *V/V* of carbon monoxide *R* in nitrogen *R1*.

Calibrate the apparatus and set the sensitivity using reference gases (a) and (b). Measure the content of carbon monoxide in the gas to be examined.

Water. Not more than 67 ppm *V/V*, determined using an electrolytic hygrometer (2.5.28).

Assay. Determine the concentration of oxygen using a paramagnetic analyser (2.5.27).

IDENTIFICATION

First identification: C.

Second identification: A, B.

- A. Place a glowing splinter of wood in the substance to be examined. The splinter bursts into flame.
- B. Shake with *alkaline pyrogallol solution R*. The substance to be examined is absorbed and the solution becomes dark brown.
- C. It complies with the limits of the assay.

TESTS

Carbon dioxide. Not more than 300 ppm V/V, determined using a carbon dioxide detector tube (2.1.6).

Carbon monoxide. Not more than 5 ppm V/V, determined using a carbon monoxide detector tube (2.1.6).

Water vapour. Not more than 67 ppm V/V, determined using a water vapour detector tube (2.1.6).

STORAGE

Store as a compressed gas or liquid in appropriate containers, complying with the legal regulations. Taps and valves are not to be greased or oiled.

IMPURITIES

- A. carbon dioxide,
- B. carbon monoxide,
- C. water.

01/2005:0943

OXYMETAZOLINE HYDROCHLORIDE

Oxymetazolini hydrochloridum

C₁₆H₂₅ClN₂OM_r 296.8

DEFINITION

Oxymetazoline hydrochloride contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 3-[(4,5-dihydro-1H-imidazol-2-yl)methyl]-6-(1,1-dimethylethyl)-2,4-dimethylphenol hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, freely soluble in water and in alcohol.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

- A. Examine by infrared absorption spectrophotometry (2.2.24) comparing with the spectrum obtained with *oxymetazoline hydrochloride CRS*.
- B. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

- C. To a solution of about 2 mg in 1 ml of *water R* add 0.2 ml of a 50 g/l solution of *sodium nitroprusside R* and 0.2 ml of *dilute sodium hydroxide solution R*. Allow to stand for 10 min. Add 2 ml of *sodium hydrogen carbonate solution R*. A violet colour develops.

- D. It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 2.5 g in *water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₇ (2.2.2, *Method II*)

Acidity or alkalinity. Dissolve 0.25 g in *water R* and dilute to 25 ml with the same solvent. Add 0.1 ml of *methyl red solution R* and 0.2 ml of 0.01 M *hydrochloric acid*. The solution is red. Not more than 0.4 ml of 0.01 M *sodium hydroxide* is required to change the colour of the indicator to yellow.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution (a). Dissolve 0.40 g of the substance to be examined in a mixture of equal volumes of *ethyl acetate R* and *methanol R* and dilute to 10 ml with the same mixture of solvents.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with a mixture of equal volumes of *ethyl acetate R* and *methanol R*.

Reference solution (a). Dissolve 40 mg of *oxymetazoline hydrochloride CRS* in a mixture of equal volumes of *ethyl acetate R* and *methanol R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dilute 1 ml of test solution (b) to 20 ml with a mixture of equal volumes of *ethyl acetate R* and *methanol R*.

Reference solution (c). Dilute 1 ml of test solution (b) to 40 ml with a mixture of equal volumes of *ethyl acetate R* and *methanol R*.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 6 volumes of *diethylamine R*, 15 volumes of *cyclohexane R* and 79 volumes of *ethanol R*. Dry the plate in a current of warm air for 5 min. Allow to cool and spray with a freshly prepared 5.0 g/l solution of *potassium ferricyanide R* in *ferric chloride solution R2*. Examine in daylight. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent) and at most one such spot is more intense than the spot in the chromatogram obtained with reference solution (c) (0.25 per cent).

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in a mixture of 20 ml of *anhydrous acetic acid R* and 20 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid* determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 29.68 mg of C₁₆H₂₅ClN₂O.

IMPURITIES

- A. *N*-(2-aminoethyl)-2-[4-(1,1-dimethylethyl)-3-hydroxy-2,6-dimethylphenyl]acetamide.

01/2005:0199

OXYTETRACYCLINE DIHYDRATE

Oxytetracyclinum dihydricum

 $C_{22}H_{24}N_2O_9 \cdot 2 H_2O$ M_r 496.4

DEFINITION

(4*S*,4*aR*,5*S*,5*aR*,6*S*,12*aS*)-4-(Dimethylamino)-3,5,6,10,12,12*a*-hexahydroxy-6-methyl-1,11-dioxo-1,4,4*a*,5,5*a*,6,11,12*a*-octahydrotetracene-2-carboxamide dihydrate.

Substance produced by the growth of certain strains of *Streptomyces rimosus* or obtained by any other means.

Content: 95.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: yellow, crystalline powder.

Solubility: very slightly soluble in water. It dissolves in dilute acid and alkaline solutions.

IDENTIFICATION

- A. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 5 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 5 mg of *oxytetracycline CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 5 mg of *oxytetracycline CRS*, 5 mg of *tetracycline hydrochloride R* and 5 mg of *minocycline hydrochloride R* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: TLC octadecylsilyl silica gel F_{254} plate *R*.

Mobile phase: mix 20 volumes of *acetonitrile R*, 20 volumes of *methanol R* and 60 volumes of a 63 g/l solution of *oxalic acid R* previously adjusted to pH 2 with *concentrated ammonia R*.

Application: 1 μ l.

Development: over 3/4 of the plate.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: the chromatogram obtained with reference solution (b) shows 3 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

- B. To about 2 mg add 5 ml of *sulphuric acid R*. A deep red colour develops. Add the solution to 2.5 ml of *water R*. The colour becomes yellow.
- C. Dissolve about 10 mg in a mixture of 1 ml of *dilute nitric acid R* and 5 ml of *water R*. Shake and add 1 ml of *silver nitrate solution R2*. Any opalescence in the solution is not more intense than that in a mixture of 1 ml of *dilute nitric acid R*, 5 ml of a 0.021 g/l solution of *potassium chloride R* and 1 ml of *silver nitrate solution R2*.

TESTS

pH (2.2.3): 4.5 to 7.5.

Suspend 0.1 g in 10 ml of *carbon dioxide-free water R*.

Specific optical rotation (2.2.7): -203 to -216 (anhydrous substance).

Dissolve 0.250 g in 0.1 *M hydrochloric acid* and dilute to 25.0 ml with the same acid.

Specific absorbance (2.2.25): 290 to 310 determined at 353 nm (anhydrous substance).

Dissolve 20.0 mg in *buffer solution pH 2.0 R* and dilute to 100.0 ml with the same buffer solution. Dilute 10.0 ml of the solution to 100.0 ml with *buffer solution pH 2.0 R*.

Light-absorbing impurities. Carry out the measurements within 1 h of preparing the solutions.

Dissolve 20.0 mg in a mixture of 1 volume of 1 *M hydrochloric acid* and 99 volumes of *methanol R* and dilute to 10.0 ml with the same mixture of solvents. The absorbance (2.2.25), determined at 430 nm has a maximum of 0.25 (anhydrous substance).

Dissolve 0.100 g in a mixture of 1 volume of 1 *M hydrochloric acid* and 99 volumes of *methanol R* and dilute to 10.0 ml with the same mixture of solvents. The absorbance (2.2.25) determined at 490 nm has a maximum of 0.20 (anhydrous substance).

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 20.0 mg of the substance to be examined in 0.01 *M hydrochloric acid* and dilute to 25.0 ml with the same acid.

Reference solution (a). Dissolve 20.0 mg of *oxytetracycline CRS* in 0.01 *M hydrochloric acid* and dilute to 25.0 ml with the same acid.

Reference solution (b). Dissolve 20.0 mg of 4-epioxytetracycline *CRS* in 0.01 *M hydrochloric acid* and dilute to 25.0 ml with the same acid.

Reference solution (c). Dissolve 20.0 mg of *tetracycline hydrochloride CRS* in 0.01 *M hydrochloric acid* and dilute to 25.0 ml with the same acid.

Reference solution (d). Mix 1.5 ml of reference solution (a), 1.0 ml of reference solution (b) and 3.0 ml of reference solution (c) and dilute to 25.0 ml with 0.01 *M hydrochloric acid*.

Reference solution (e). Mix 1.0 ml of reference solution (b) and 4.0 ml of reference solution (c) and dilute to 200.0 ml with 0.01 *M hydrochloric acid*.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: styrene-divinylbenzene copolymer *R* (8 μ m),
- temperature: 60 °C.

Mobile phase: weigh 60.0 g of 2-methyl-2-propanol *R* and transfer to a 1000 ml volumetric flask with the aid of 200 ml of water *R*; add 60 ml of 0.33 *M* phosphate buffer solution pH 7.5 *R*, 50 ml of a 10 g/l solution of tetrabutylammonium hydrogen sulphate *R* adjusted to pH 7.5 with dilute sodium hydroxide solution *R* and 10 ml of a 0.4 g/l solution of sodium edetate *R* adjusted to pH 7.5 with dilute sodium hydroxide solution *R*; dilute to 1000 ml with water *R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 µl; inject the test solution and reference solutions (d) and (e).

System suitability: reference solution (d):

- **resolution:** minimum 4.0 between the peaks due to impurity A (1st peak) and oxytetracycline (2nd peak) and minimum 5.0 between the peaks and due to oxytetracycline and impurity B (3rd peak); adjust the 2-methyl-2-propanol content in the mobile phase if necessary,
- **symmetry factor:** maximum 1.25 for the peak due to oxytetracycline.

Limits:

- **impurity A:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (e) (0.5 per cent),
- **impurity B:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (e) (2.0 per cent),
- **impurity C (eluting on the tail of the principal peak):** not more than 4 times the area of the peak due to impurity A in the chromatogram obtained with reference solution (e) (2.0 per cent),
- **disregard limit:** 0.02 times the area of the peak due to oxytetracycline in the chromatogram obtained with reference solution (d) (0.1 per cent).

Heavy metals (2.4.8): maximum 50 ppm.

0.5 g complies with limit test F. Prepare the standard using 2.5 ml of lead standard solution (10 ppm Pb) *R*.

Water (2.5.12): 6.0 per cent to 9.0 per cent, determined on 0.250 g.

Sulphated ash (2.4.14): maximum 0.5 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modification.

Injection: test solution and reference solution (a).

Calculate the percentage content of C₂₂H₂₄N₂O₉.

STORAGE

In an airtight container, protected from light.

IMPURITIES

- A. R1 = NH₂, R2 = N(CH₃)₂, R3 = R4 = H, R5 = OH:
(4*R*,4*aR*,5*S*,5*aR*,6*S*,12*aS*)-4-(dimethylamino)-3,5,6,10,12,12*a*-hexahydroxy-6-methyl-1,11-dioxo-1,4,4*a*,5,5*a*,6,11,12*a*-octahydrotetracene-2-carboxamide (4-epioxytetracycline),
- B. R1 = NH₂, R2 = R4 = R5 = H, R3 = N(CH₃)₂: tetracycline,

- C. R1 = CH₃, R2 = R4 = H, R3 = N(CH₃)₂, R5 = OH:
(4*S*,4*aR*,5*S*,5*aR*,6*S*,12*aS*)-2-acetyl-4-(dimethylamino)-3,5,6,10,12,12*a*-hexahydroxy-6-methyl-4*a*,5*a*,6,12*a*-tetrahydrotetracene-1,11(4*H*,5*H*)-dione
(2-acetyl-2-decarbamoxyloxytetracycline).

01/2005:0198

OXYTETRACYCLINE HYDROCHLORIDE

Oxytetracyclini hydrochloridum

C₂₂H₂₅ClN₂O₉

M_r 496.9

DEFINITION

(4*S*,4*aR*,5*S*,5*aR*,6*S*,12*aS*)-4-(Dimethylamino)-3,5,6,10,12,12*a*-hexahydroxy-6-methyl-1,11-dioxo-1,4,4*a*,5,5*a*,6,11,12*a*-octahydrotetracene-2-carboxamide hydrochloride.

Substance produced by the growth of certain strains of *Streptomyces rimosus* or obtained by any other means.

Content: 95.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: yellow, crystalline powder, hygroscopic.

Solubility: freely soluble in water, sparingly soluble in alcohol. Solutions in water become turbid on standing, owing to the precipitation of oxytetracycline.

IDENTIFICATION

A. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 5 mg of the substance to be examined in methanol *R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 5 mg of oxytetracycline hydrochloride CRS in methanol *R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 5 mg of oxytetracycline hydrochloride CRS, 5 mg of tetracycline hydrochloride *R* and 5 mg of minocycline hydrochloride *R* in methanol *R* and dilute to 10 ml with the same solvent.

Plate: TLC octadecylsilyl silica gel F₂₅₄ plate *R*.

Mobile phase: mix 20 volumes of acetonitrile *R*, 20 volumes of methanol *R* and 60 volumes of a 63 g/l solution of oxalic acid *R* previously adjusted to pH 2 with concentrated ammonia *R*.

Application: 1 µl.

Development: over 3/4 of the plate.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: the chromatogram obtained with reference solution (b) shows 3 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

- B. To about 2 mg add 5 ml of *sulphuric acid R*. A deep red colour develops. Add the solution to 2.5 ml of *water R*. The colour becomes yellow.
- C. It gives reaction (a) of chlorides (2.3.1).

TESTS

pH (2.2.3): 2.3 to 2.9.

Dissolve 0.1 g in 10 ml of *carbon dioxide-free water R*.

Specific optical rotation (2.2.7): –188 to –200 (anhydrous substance).

Dissolve 0.250 g in 0.1 M *hydrochloric acid* and dilute to 25.0 ml with the same acid.

Specific absorbance (2.2.25): 270 to 290 determined at 353 nm (anhydrous substance).

Dissolve 20.0 mg in *buffer solution pH 2.0 R* and dilute to 100.0 ml with the same buffer solution. Dilute 10.0 ml of the solution to 100.0 ml with *buffer solution pH 2.0 R*.

Light-absorbing impurities. Carry out the measurements within 1 h of preparing the solutions.

Dissolve 20.0 mg in a mixture of 1 volume of 1 M *hydrochloric acid* and 99 volumes of *methanol R* and dilute to 10.0 ml with the same mixture of solvents. The absorbance (2.2.25) determined at 430 nm has a maximum of 0.50 (anhydrous substance).

Dissolve 0.100 g in a mixture of 1 volume of 1 M *hydrochloric acid* and 99 volumes of *methanol R* and dilute to 10.0 ml with the same mixture of solvents. The absorbance (2.2.25) determined at 490 nm has a maximum of 0.20 (anhydrous substance).

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 20.0 mg of the substance to be examined in 0.01 M *hydrochloric acid* and dilute to 25.0 ml with the same acid.

Reference solution (a). Dissolve 20.0 mg of *oxytetracycline CRS* in 0.01 M *hydrochloric acid* and dilute to 25.0 ml with the same acid.

Reference solution (b). Dissolve 20.0 mg of 4-epioxytetracycline *CRS* in 0.01 M *hydrochloric acid* and dilute to 25.0 ml with the same acid.

Reference solution (c). Dissolve 20.0 mg of *tetracycline hydrochloride CRS* in 0.01 M *hydrochloric acid* and dilute to 25.0 ml with the same acid.

Reference solution (d). Dissolve 8.0 mg of α -apo-oxytetracycline *CRS* in 5 ml of 0.01 M *sodium hydroxide* and dilute to 100.0 ml with 0.01 M *hydrochloric acid*.

Reference solution (e). Dissolve 8.0 mg of β -apo-oxytetracycline *CRS* in 5 ml of 0.01 M *sodium hydroxide* and dilute to 100.0 ml with 0.01 M *hydrochloric acid*.

Reference solution (f). Mix 1.5 ml of reference solution (a), 1.0 ml of reference solution (b), 3.0 ml of reference solution (c), 3.0 ml of reference solution (d) and 3.0 ml of reference solution (e) and dilute to 25.0 ml with 0.01 M *hydrochloric acid*.

Reference solution (g). Mix 1.0 ml of reference solution (b), 4.0 ml of reference solution (c) and 40.0 ml of reference solution (e) and dilute to 200.0 ml with 0.01 M *hydrochloric acid*.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: *styrene-divinylbenzene copolymer R* (8 μ m),
- temperature: 60 °C.

Mobile phase: weigh 30.0 g (for mobile phase A) and 100.0 g (for mobile phase B) of 2-methyl-2-propanol *R* and transfer separately to 1000 ml volumetric flasks with the aid of 200 ml of *water R*; to each flask add 60 ml of 0.33 M *phosphate buffer solution pH 7.5 R*, 50 ml of a 10 g/l solution of *tetrabutylammonium hydrogen sulphate R* adjusted to pH 7.5 with *dilute sodium hydroxide solution R* and 10 ml of a 0.4 g/l solution of *sodium edetate R* adjusted to pH 7.5 with *dilute sodium hydroxide solution R*; dilute each solution to 1000 ml with *water R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 15	70	30
15 - 30	30	70
30 - 45	70	30

Flow rate: 1 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 μ l; inject the test solution and reference solutions (f) and (g).

System suitability: reference solution (f):

- resolution: minimum 4.0 between the peaks due to impurity A (1st peak) and oxytetracycline (2nd peak), minimum 5.0 between the peaks due to oxytetracycline and impurity B (3rd peak) and minimum 3.5 between the peaks due to impurity D (4th peak) and impurity E (5th peak); if necessary, adapt the ratio mobile phase A: mobile phase B and/or adjust the time programme used to produce the one-step gradient elution,
- symmetry factor: maximum 1.25 for the peak due to oxytetracycline.

Limits:

- impurity A: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (g) (0.5 per cent),
- impurity B: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (g) (2.0 per cent),
- impurity C (eluting on the tail of the main peak): not more than 4 times the area of the peak due to impurity A in the chromatogram obtained with reference solution (g) (2.0 per cent),
- total of impurities D, E and F (eluting between the latter two): not more than the area of the peak due to impurity E in the chromatogram obtained with reference solution (g) (2.0 per cent),
- disregard limit: 0.02 times the area of the peak due to oxytetracycline in the chromatogram obtained with reference solution (f) (0.1 per cent).

Heavy metals (2.4.8): maximum 50 ppm.

0.5 g complies with limit test F. Prepare the standard using 2.5 ml of *lead standard solution (10 ppm Pb) R*.

Water (2.5.12): maximum 2.0 per cent, determined on 0.500 g.

Sulphated ash (2.4.14): maximum 0.5 per cent, determined on 1.0 g.

Bacterial endotoxins (2.6.14): less than 0.4 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modification.

Injection: test solution and reference solution (a).

01/2005:0780

Calculate the percentage content of $C_{22}H_{25}ClN_2O_9$ taking 1 mg of oxytetracycline as equivalent to 1.079 mg of oxytetracycline hydrochloride.

STORAGE

In an airtight container, protected from light. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

- A. $R_1 = NH_2$, $R_2 = N(CH_3)_2$, $R_3 = R_4 = H$, $R_5 = OH$: (4*R*,4*aR*,5*S*,5*aR*,6*S*,12*aS*)-4-(dimethylamino)-3,5,6,10,12,12*a*-hexahydroxy-6-methyl-1,11-dioxo-1,4,4*a*,5,5*a*,6,11,12*a*-octahydrotetracene-2-carboxamide (4-epioxytetracycline),
- B. $R_1 = NH_2$, $R_2 = R_4 = R_5 = H$, $R_3 = N(CH_3)_2$: tetracycline,
- C. $R_1 = CH_3$, $R_2 = R_4 = H$, $R_3 = N(CH_3)_2$, $R_5 = OH$: (4*S*,4*aR*,5*S*,5*aR*,6*S*,12*aS*)-2-acetyl-4-(dimethylamino)-3,5,6,10,12,12*a*-hexahydroxy-6-methyl-4*a*,5*a*,6,12*a*-tetrahydrotetracene-1,11-(4*H*,5*H*)-dione (2-acetyl-2-decarbamoxyloxytetracycline),

- D. $R = OH$, $R' = H$: (3*S*,4*S*,5*S*)-4-[(1*R*)-4,5-dihydroxy-9-methyl-3-oxo-1,3-dihydronaphtho[2,3-*c*]furan-1-yl]-3-(dimethylamino)-2,5-dihydroxy-6-oxocyclohex-1-enecarboxamide (α-apo-oxytetracycline),
- E. $R = H$, $R' = OH$: (3*S*,4*S*,5*R*)-4-[(1*R*)-4,5-dihydroxy-9-methyl-3-oxo-1,3-dihydronaphtho[2,3-*c*]furan-1-yl]-3-(dimethylamino)-2,5-dihydroxy-6-oxocyclohex-1-enecarboxamide (β-apo-oxytetracycline),

- F. (4*S*,4*aR*,5*R*,12*aS*)-4-(dimethylamino)-3,5,10,11,12*a*-pentahydroxy-6-methyl-1,12-dioxo-1,4,4*a*,5,12,12*a*-hexahydrotetracene-2-carboxamide (anhydro-oxytetracycline).

OXYTOCIN

Oxytocinum

DEFINITION

Oxytocin is a cyclic nonapeptide having the structure of the hormone produced by the posterior lobe of the pituitary gland that stimulates contraction of the uterus and milk ejection in receptive mammals. It is obtained by chemical synthesis and is available in the freeze-dried form as an acetate. It contains not less than 93.0 per cent and not more than the equivalent of 102.0 per cent of the peptide $C_{43}H_{66}N_{12}O_{12}S_2$, calculated with reference to the anhydrous, acetic acid-free substance.

By convention, for the purpose of labelling oxytocin preparations, 1 mg of oxytocin peptide ($C_{43}H_{66}N_{12}O_{12}S_2$) is equivalent to 600 IU of biological activity.

CHARACTERS

A white or almost white powder, hygroscopic, very soluble in water and in dilute solutions of acetic acid and of ethanol.

IDENTIFICATION

Examine the chromatograms obtained in the assay. The retention time of the principal peak in the chromatogram obtained with the test solution is approximately the same as that of the principal peak in the chromatogram obtained with the reference solution.

TESTS

pH (2.2.3). Dissolve 0.200 g in *carbon dioxide-free water R* and dilute to 10.0 ml with the same solvent. The pH of the solution is 3.0 to 6.0.

Amino acids. Examine by means of an amino-acid analyser. Standardise the apparatus with a mixture containing equimolar amounts of ammonia, glycine and the L-form of the following amino acids:

lysine	threonine	alanine	leucine
histidine	serine	valine	tyrosine
arginine	glutamic acid	methionine	phenylalanine
aspartic acid	proline	isoleucine	

together with half the equimolar amount of L-cystine. For the validation of the method, an appropriate internal standard, such as *DL-norleucine R*, is used.

Test solution. Place 1.0 mg of the substance to be examined in a rigorously cleaned hard-glass tube 100 mm long and 6 mm in internal diameter. Add a suitable amount of a 50 per cent *V/V* solution of *hydrochloric acid R*. Immerse the tube in a freezing mixture at $-5^\circ C$, reduce the pressure to below 133 Pa and seal. Heat at $110^\circ C$ to $115^\circ C$ for 16 h. Cool, open the tube, transfer the contents to a 10 ml flask with the aid of five quantities, each of 0.2 ml, of *water R* and evaporate to dryness over *potassium hydroxide R* under reduced pressure. Take up the residue in *water R* and evaporate to dryness over *potassium hydroxide R* under reduced pressure; repeat these operations once. Take up the residue in a buffer solution suitable for the amino-acid analyser used and dilute to a suitable volume with the same buffer solution. Apply a suitable volume to the amino-acid analyser.

Express the content of each amino acid in moles. Calculate the relative proportions of the amino acids, taking one-sixth of the sum of the number of moles of aspartic acid, glutamic acid, proline, glycine, isoleucine and leucine as equal to one. The values fall within the following limits: aspartic acid 0.95 to 1.05; glutamic acid 0.95 to 1.05; proline 0.95 to 1.05; glycine 0.95 to 1.05; leucine 0.90 to 1.10; isoleucine 0.90 to 1.10; tyrosine 0.7 to 1.05; half-cystine 1.4 to 2.1; not more than traces of other amino acids are present.

Related peptides. Examine by liquid chromatography (2.2.29) as described under Assay.

Inject 50 µl of the test solution. In the chromatogram obtained the area of any peak, apart from the principal peak, is not greater than 1.5 per cent of the total area of the peaks; the sum of the areas of all the peaks, apart from the principal peak, is not greater than 5 per cent of the total area of the peaks. Disregard any peak due to the solvent and any peak with an area less than 0.1 per cent of that of the principal peak.

Acetic acid (2.5.34): 6.0 per cent to 10.0 per cent.

Test solution. Dissolve 15.0 mg of the substance to be examined in a mixture of 5 volumes of mobile phase B and 95 volumes of mobile phase A and dilute to 10.0 ml with the same mixture of solvents.

Water (2.5.12). Not more than 5.0 per cent, determined on at least 50 mg by the semi-micro determination of water.

Bacterial endotoxins (2.6.14): less than 300 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for removal of bacterial endotoxins.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution. Prepare a 0.25 mg/ml solution of the substance to be examined in a 15.6 g/l solution of *sodium dihydrogen phosphate R*.

Reference solution. Dissolve the contents of a vial of *oxytocin CRS* in a 15.6 g/l solution of *sodium dihydrogen phosphate R* to obtain a concentration of 0.25 mg/ml.

Resolution solution. Dissolve the contents of a vial of *oxytocin/desmopressin validation mixture CRS* in 500 µl of a 15.6 g/l solution of *sodium dihydrogen phosphate R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.125 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),

- as mobile phase at a flow rate of 1 ml/min:

Mobile phase A. A 15.6 g/l solution of *sodium dihydrogen phosphate R*,

Mobile phase B. Mix 1 volume of *acetonitrile for chromatography R* with 1 volume of *water R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 30	70 → 40	30 → 60	linear gradient
30 - 30.1	40 → 70	60 → 30	switch to initial eluent composition
30.1 - 45	70	30	re-equilibration

- as detector a spectrophotometer set at 220 nm.

Equilibrate the column with a mixture of 30 volumes of mobile phase B and 70 volumes of mobile phase A.

Inject 25 µl of the resolution solution. When the chromatograms are recorded in the prescribed conditions, the retention times are: oxytocin about 7.5 min and

desmopressin about 10 min. The test is not valid unless the resolution between the peaks corresponding to desmopressin and oxytocin is at least 5.0.

Inject 25 µl of the test solution and 25 µl of the reference solution.

Calculate the content of oxytocin ($C_{43}H_{66}N_{12}O_{12}S_2$) from the peak areas in the chromatograms obtained with the test solution and the reference solution and the declared content of $C_{43}H_{66}N_{12}O_{12}S_2$ in *oxytocin CRS*.

STORAGE

Store in an airtight container, protected from light, at a temperature of 2 °C to 8 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states:

- the oxytocin peptide content ($C_{43}H_{66}N_{12}O_{12}S_2$),
- where applicable, that the substance is free from bacterial endotoxins.

01/2005:0779

OXYTOCIN BULK SOLUTION

Oxytocini solutio

DEFINITION

Oxytocin bulk solution is a solution of oxytocin, a cyclic nonapeptide having the structure of the hormone produced by the posterior lobe of the pituitary gland that stimulates contraction of the uterus and milk ejection in receptive mammals. It is obtained by chemical synthesis. It is available as a bulk solution with a stated concentration of not less than 0.25 mg of oxytocin per millilitre, in a solvent that may contain an appropriate antimicrobial preservative. It contains not less than 95.0 per cent and not more than 105.0 per cent of the amount of the peptide $C_{43}H_{66}N_{12}O_{12}S_2$ stated per millilitre.

By convention, for the purpose of labelling oxytocin preparations, 1 mg of oxytocin peptide ($C_{43}H_{66}N_{12}O_{12}S_2$) is equivalent to 600 IU of biological activity.

CHARACTERS

A clear, colourless liquid.

IDENTIFICATION

Examine the chromatograms obtained under Assay. The retention time of the principal peak in the chromatogram obtained with the test solution is similar to that of the principal peak in the chromatogram obtained with the reference solution.

TESTS

pH (2.2.3). The pH of the preparation to be examined is 3.0 to 5.0.

Amino acids. Examine by means of an amino-acid analyser. Standardise the apparatus with a mixture containing equimolar amounts of ammonia, glycine and the L-form of the following amino acids:

lysine	threonine	alanine	leucine
histidine	serine	valine	tyrosine
arginine	glutamic acid	methionine	phenylalanine
aspartic acid	proline	isoleucine	

together with half the equimolar amount of L-cystine. For the validation of the method, an appropriate internal standard, such as *DL-norleucine R*, is used.

Test solution. Place a volume of the preparation to be examined containing 0.25 mg of peptide in a rigorously cleaned hard-glass tube 100 mm long and 6 mm in internal diameter. Evaporate to dryness. Add a suitable amount of a 50 per cent *V/V* solution of *hydrochloric acid R*. Immerse the tube in a freezing mixture at -5°C , reduce the pressure to below 133 Pa and seal. Heat at 110°C to 115°C for 16 h. Cool, open the tube, transfer the contents to a 10 ml flask with the aid of five quantities, each of 0.2 ml, of *water R* and evaporate to dryness over *potassium hydroxide R* under reduced pressure. Take up the residue in *water R* and evaporate to dryness over *potassium hydroxide R* under reduced pressure; repeat these operations once. Take up the residue in a buffer solution suitable for the amino-acid analyser used and dilute to a suitable volume with the same buffer solution.

Apply to the amino-acid analyser a suitable, accurately measured volume of the test solution such that the peak given by the amino acid present in the largest amount occupies most of the available chart height of the recorder.

Express the content of each amino acid in moles. Calculate the relative proportions of the amino acids taking one sixth of the sum of the number of moles of aspartic acid, glutamic acid, proline, glycine, isoleucine and leucine as equal to 1. The values fall within the following limits: aspartic acid 0.95 to 1.05; glutamic acid 0.95 to 1.05; proline 0.95 to 1.05; glycine 0.95 to 1.05; leucine 0.90 to 1.10; isoleucine 0.90 to 1.10; tyrosine 0.7 to 1.05; half cystine 1.4 to 2.1; not more than traces of other amino acids are present.

Related peptides. Examine by liquid chromatography (2.2.29) as described under Assay.

Inject 50 μl of the test solution. In the chromatogram obtained, the area of any peak apart from the principal peak is not greater than 1.5 per cent of the total area of the peaks; the sum of the areas of all peaks, apart from the principal peak, is not greater than 5 per cent of the total area of the peaks. Disregard any peak due to the solvent or to the antimicrobial preservative and any peak with an area less than 0.1 per cent of that of the principal peak.

Bacterial endotoxins (2.6.14): less than 300 IU in the volume that contains 1 mg of oxytocin, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution. Use the preparation to be examined.

Reference solution. Dissolve the contents of a vial of *oxytocin CRS* in a 15.6 g/l solution of *sodium dihydrogen phosphate R* to obtain a concentration of 0.25 mg/ml.

Resolution solution. Dissolve the contents of a vial of *oxytocin/desmopressin validation mixture CRS* with 500 μl of a 15.6 g/l solution of *sodium dihydrogen phosphate R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.125 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 μm),

- as mobile phases at a flow rate of 1 ml/min:

Mobile phase A. A 15.6 g/l solution of *sodium dihydrogen phosphate R*,

Mobile phase B. Mix 1 volume of *acetonitrile for chromatography R* with 1 volume of *water R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 30	70 $\rightarrow$ 40	30 $\rightarrow$ 60	linear gradient
30 - 30.1	40 $\rightarrow$ 70	60 $\rightarrow$ 30	return to initial conditions
30.1 - 45	70	30	re-equilibration

- as detector a spectrophotometer set at 220 nm.

Equilibrate the column with a mixture of 30 volumes of mobile phase B and 70 volumes of mobile phase A.

Inject 25 μl of the resolution solution. When the chromatograms are recorded in the prescribed conditions, the retention times are: oxytocin about 7.5 min and desmopressin about 10 min. The test is not valid unless the resolution between the desmopressin peak and the oxytocin peak is at least 5.0.

Inject 25 μl of the reference solution and 25 μl of the test solution. Calculate the content of oxytocin ($\text{C}_{43}\text{H}_{66}\text{N}_{12}\text{O}_{12}\text{S}_2$) from the peak areas in the chromatograms obtained with the test solution and the reference solution and the declared content of $\text{C}_{43}\text{H}_{66}\text{N}_{12}\text{O}_{12}\text{S}_2$ in *oxytocin CRS*.

STORAGE

Store at a temperature between 2°C and 8°C , protected from light. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states:

- the oxytocin peptide content in milligrams of $\text{C}_{43}\text{H}_{66}\text{N}_{12}\text{O}_{12}\text{S}_2$ per millilitre,
- where applicable, that the preparation is free from bacterial endotoxins,
- the name of any added antimicrobial preservative.

01/2005:1904

PALMITIC ACID**Acidum palmiticum****DEFINITION**

Hexadecanoic acid ($C_{16}H_{32}O_2$; M_r 256.4), obtained from fats or oils of vegetable or animal origin.

Content: minimum 92.0 per cent.

CHARACTERS

Appearance: white, waxy solid.

Solubility: practically insoluble in water, soluble in alcohol.

IDENTIFICATION

- It complies with the test for freezing point (see Tests).
- Acid value (2.5.1): 216 to 220, determined on 0.1 g.
- Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with the reference solution.

TESTS

Appearance. Heat the substance to be examined to about 75 °C. The resulting liquid is not more intensely coloured than reference solution Y_7 or BY_7 (2.2.2, Method I).

Acidity. Melt 5.0 g, stir for 2 min in 10 ml of hot *carbon dioxide-free water R*, cool slowly and filter. To the filtrate add 0.05 ml of *methyl orange solution R*. No red colour develops.

Freezing point (2.2.18): 60 °C to 66 °C.

Iodine value (2.5.4): maximum 1.

Stearic acid: maximum 6.0 per cent, determined as prescribed in the assay.

Nickel (2.4.27): maximum 1 ppm.

ASSAY

Gas chromatography (2.4.22, Method C). Prepare the solutions as described in the method but omitting the initial hydrolysis.

Reference solution. Prepare the reference solution in the same manner as the test solution using a mixture of 50 mg of *palmitic acid R* and 50 mg of *stearic acid R* instead of the substance to be examined.

Relative retention with reference to methyl stearate: methyl palmitate = about 0.9.

System suitability:

- *resolution*: minimum 5.0 between the peaks due to methyl stearate and methyl palmitate.

01/2005:0350

PANCREAS POWDER**Pancreatis pulvis****DEFINITION**

Pancreas powder is prepared from the fresh or frozen pancreases of mammals. It contains various enzymes having proteolytic, lipolytic and amylolytic activities.

1 milligram of pancreas powder contains not less than 1.0 European Pharmacopoeia Unit (Ph. Eur. U.) of total proteolytic activity, 15 European Pharmacopoeia Units of lipolytic activity and 12 European Pharmacopoeia Units of amylolytic activity.

Pancreas powder is prepared in conditions designed to minimise the degree of microbial contamination.

CHARACTERS

A slightly brown, amorphous powder, partly soluble in water, practically insoluble in alcohol.

IDENTIFICATION

- Triturate 0.5 g with 10 ml of *water R* and adjust to pH 8 by the addition of 0.1 M *sodium hydroxide*, using 0.1 ml of *cresol red solution R* as indicator. Divide the suspension into two equal parts (suspension (a) and suspension (b)). Boil suspension (a). To each suspension add 10 mg of *fibrin congo red R*, heat to 38 °C to 40 °C and maintain at this temperature for 1 h. Suspension (a) is colourless or slightly pink and suspension (b) is distinctly more red.

- Triturate 0.25 g with 10 ml of *water R* and adjust to pH 8 by the addition of 0.1 M *sodium hydroxide*, using 0.1 ml of *cresol red solution R* as indicator. Divide the suspension into two equal parts (suspension (a) and suspension (b)). Boil suspension (a). Dissolve 0.1 g of *soluble starch R* in 100 ml of boiling *water R*, boil for 2 min, cool and dilute to 150 ml with *water R*. To 75 ml of the starch solution add suspension (a) and to the remaining 75 ml add suspension (b). Heat each mixture to 38 °C to 40 °C and maintain at this temperature for 5 min.

To 1 ml of each mixture add 10 ml of *iodine solution R2*. The mixture obtained with suspension (a) has an intense blue-violet colour; the mixture obtained with suspension (b) has the colour of the iodine solution.

TESTS

Fat content. In an extraction apparatus, treat 1.0 g with *light petroleum R1* for 3 h. Evaporate the solvent and dry the residue at 100 °C to 105 °C for 2 h. The residue weighs not more than 50 mg (5.0 per cent).

Loss on drying (2.2.32). Not more than 5.0 per cent, determined on 0.50 g by drying at 60 °C at a pressure not exceeding 670 Pa for 4 h.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10^4 micro-organisms per gram, determined by plate count. It complies with the tests for *Escherichia coli* and *Salmonella* (2.6.13).

ASSAY

Total proteolytic activity. The total proteolytic activity of pancreas powder is determined by comparing the quantity of peptides non-precipitable by a 50 g/l solution of *trichloroacetic acid R* released per minute from a substrate of casein solution with the quantity of such peptides released by *pancreas powder (protease) BRP* from the same substrate in the same conditions.

Casein solution. Suspend a quantity of *casein BRP* equivalent to 1.25 g of dried substance in 5 ml of *water R*, add 10 ml of 0.1 M *sodium hydroxide* and stir for 1 min. (Determine the water content of *casein BRP* prior to the test by heating at 60 °C *in vacuo* for 4 h.) Add 60 ml of *water R* and stir with a magnetic stirrer until the solution is practically clear. Adjust to pH 8.0 with 0.1 M *sodium hydroxide* or 0.1 M *hydrochloric acid*. Dilute to 100.0 ml with *water R*. Use the solution on the day of preparation.

Enterokinase solution. Dissolve 50 mg of *enterokinase BRP* in 0.02 M calcium chloride solution R and dilute to 50.0 ml with the same solvent. Use the solution on the day of preparation.

For the test suspension and the reference suspension, prepare the suspension and carry out the dilution at 0 °C to 4 °C.

Test suspension. Triturate 0.100 g of the substance to be examined for 5 min adding gradually 25 ml of 0.02 M calcium chloride solution R. Transfer completely to a volumetric flask and dilute to 100.0 ml with 0.02 M calcium chloride solution R. To 10.0 ml of this suspension add 10.0 ml of enterokinase solution and heat on a water-bath at 35 ± 0.5 °C for 15 min. Cool and dilute with borate buffer solution pH 7.5 R at 5 ± 3 °C to a final concentration of about 0.065 Ph. Eur. U. of total proteolytic activity per millilitre calculated on the basis of the stated activity.

Reference suspension. Prepare a suspension of *pancreas powder (protease) BRP* as described for the test suspension but without the addition of enterokinase so as to obtain a known final concentration of about 0.065 Ph. Eur. U. per millilitre calculated on the basis of the stated activity.

Designate tubes in duplicate T, T_b, S₁, S_{1b}, S₂, S_{2b}, S₃, S_{3b}; designate a tube B.

Add borate buffer solution pH 7.5 R to the tubes as follows:

B: 3.0 ml,

S₁ and S_{1b}: 2.0 ml,

S₂, S_{2b}, T and T_b: 1.0 ml.

Add the reference suspension to the tubes as follows:

S₁ and S_{1b}: 1.0 ml,

S₂ and S_{2b}: 2.0 ml,

S₃ and S_{3b}: 3.0 ml.

Add 2.0 ml of the test suspension to tubes T and T_b.

Add 5.0 ml of a 50 g/l solution of *trichloroacetic acid R* to tubes B, S_{1b}, S_{2b}, S_{3b} and T_b. Mix by shaking.

Place the tubes and the casein solution in a water-bath at 35 ± 0.5 °C. Place a glass rod in each tube. When temperature equilibrium is reached, add 2.0 ml of the casein solution to tubes B, S_{1b}, S_{2b}, S_{3b} and T_b. Mix. At time zero, add 2.0 ml of casein solution successively and at intervals of 30 s to tubes S₁, S₂, S₃ and T. Mix immediately after each addition. Exactly 30 min after addition of the casein solution, taking into account the regular interval adopted, add 5.0 ml of a 50 g/l solution of *trichloroacetic acid R* to tubes S₁, S₂, S₃ and T. Mix. Withdraw the tubes from the water-bath and allow to stand at room temperature for 20 min.

Filter the contents of each tube twice through the same suitable filter paper previously washed with a 50 g/l solution of *trichloroacetic acid R*, then with *water R* and dried.

A suitable filter paper complies with the following test: filter 5 ml of a 50 g/l of *trichloroacetic acid R* on a 7 cm disc of white filter paper; the absorbance (2.2.25) of the filtrate, measured at 275 nm using unfiltered trichloroacetic acid solution as the compensation liquid, is less than 0.04.

A schematic presentation of the above operations is shown in Table 0350.-1.

Table 0350.-1

	Tubes								
	S ₁	S _{1b}	S ₂	S _{2b}	S ₃	S _{3b}	T	T _b	B
Buffer solution	2	2	1	1			1	1	3
Reference solution	1	1	2	2	3	3			
Suspension test							2	2	
Trichloroacetic acid solution		5		5		5		5	5
Mix		+		+		+		+	+
Water-bath 35 °C	+	+	+	+	+	+	+	+	+
Casein solution		2		2		2		2	2
Mix		+		+		+		+	+
Casein solution	2		2		2		2		
Mix	+		+		+		+		
Water-bath 35 °C 30 min	+	+	+	+	+	+	+	+	+
Trichloroacetic solution	5		5		5		5		
Mix	+		+		+		+		
Room temperature 20 min	+	+	+	+	+	+	+	+	+
Filter	+	+	+	+	+	+	+	+	+

Measure the absorbance (2.2.25) of the filtrates at 275 nm using the filtrate obtained from tube B as the compensation liquid.

Correct the average absorbance values for the filtrates obtained from tubes S₁, S₂ and S₃ by subtracting the average values obtained for the filtrates from tubes S_{1b}, S_{2b} and S_{3b} respectively. Draw a calibration curve of the corrected values against volume of reference suspension used.

Determine the activity of the substance to be examined using the corrected absorbance for the test suspension (T – T_b) and the calibration curve and taking into account the dilution factors.

The test is not valid unless the corrected absorbance values are between 0.15 and 0.60.

Lipolytic activity. The lipolytic activity is determined by comparing the rate at which a suspension of pancreas powder hydrolyses a substrate of olive oil emulsion with the rate at which a suspension of *pancreas powder (amylase and lipase) BRP* hydrolyses the same substrate under the same conditions. *The test is carried out under nitrogen.*

Olive oil stock emulsion. In an 800 ml beaker 9 cm in diameter, place 40 ml of *olive oil R*, 330 ml of *acacia solution R* and 30 ml of *water R*. Place an electric mixer at the bottom of the beaker. Place the beaker in a vessel containing *alcohol R* and a sufficient quantity of ice as a cooling mixture. Emulsify using the mixer at an average speed of 1000 r/min to 2000 r/min. Cool to 5 °C to 10 °C. Increase the mixing speed to 8000 r/min. Mix for 30 min keeping the temperature below 25 °C by the continuous addition of crushed ice into the cooling mixture. (A mixture of calcium chloride and crushed ice is also suitable). Store the stock emulsion in a refrigerator and use within 14 days. The emulsion must not separate into two distinct layers. Check the diameter of the globules of the emulsion under a microscope. At least 90 per cent have a diameter below 3 µm and none has a diameter greater than 10 µm. Shake the emulsion thoroughly before preparing the emulsion substrate.

Olive oil emulsion. For ten determinations, mix the following solutions in the order indicated: 100 ml of stock emulsion, 80 ml of *tris(hydroxymethyl)aminomethane*

solution R1, 20 ml of a freshly prepared 80 g/l of *sodium taurocholate BRP* and 95 ml of *water R*. Use on the day of preparation.

Apparatus. Use a reaction vessel of about 50 ml capacity provided with:

- a device that will maintain a temperature of 37 ± 0.5 °C,
- a magnetic stirrer,
- a lid with holes for the insertion of electrodes, the tip of a burette, a tube for the admission of nitrogen and the introduction of reagents.

An automatic or manual titration apparatus may be used. In the latter case, the burette is graduated in 0.005 ml and the pH-meter is provided with a wide reading scale and glass-calomel electrodes. After each test the reaction vessel is evacuated by suction and washed several times with *water R*, the washings being removed each time by suction.

Test suspension. In a small mortar cooled to 0 °C to 4 °C, triturate carefully a quantity of the substance to be examined equivalent to about 2500 Ph. Eur. U. of lipolytic activity with 1 ml of cooled *maleate buffer solution pH 7.0 R* (lipase solvent) until a very fine suspension is obtained. Dilute the suspension with cold *maleate buffer solution pH 7.0 R*, transfer quantitatively to a volumetric flask and dilute to 100.0 ml with the cold buffer solution. Keep the flask containing the test suspension in iced water during the titration.

Reference suspension. To avoid absorption of water formed by condensation, allow the reference preparation to reach room temperature before opening the container. Prepare a suspension of *pancreas powder (amylase and lipase) BRP* as described for the test suspension using a quantity equivalent to about 2500 Ph. Eur. U.

Carry out the titrations immediately after preparation of the test suspension and the reference suspension. Place 29.5 ml of olive oil emulsion in the reaction vessel equilibrated at 37 ± 0.5 °C. Fit the vessel with the electrodes, a stirrer and the burette (the tip being immersed in the olive oil emulsion).

Put the lid in place and switch on the apparatus. Carefully add 0.1 M sodium hydroxide with stirring. Adjust to pH 9.2. Using a rapid-flow graduated pipette transfer about 0.5 ml of the previously homogenised reference suspension, start the chronometer and add continuously 0.1 M sodium hydroxide to maintain the pH at 9.0. After exactly 1 min, note the volume of 0.1 M sodium hydroxide used. Carry out the measurement a further four times. Discard the first reading and determine the average of the four others (S_1). Make two further determinations (S_2 and S_3). Calculate the average of the values S_1 , S_2 and S_3 . The average volume of 0.1 M sodium hydroxide used should be about 0.12 ml/min with limits of 0.08 ml to 0.16 ml.

Carry out three determinations in the same manner for the test suspension (T_1 , T_2 and T_3). If the quantity of 0.1 M sodium hydroxide used is outside the limits 0.08 ml to 0.16 ml per minute, the assay is repeated with a quantity of test suspension which is more suitable but situated between 0.4 ml and 0.6 ml. Otherwise the quantity of the substance to be examined is adjusted to comply with the conditions of the test. Calculate the average of the values T_1 , T_2 and T_3 .

Calculate the activity in Ph. Eur. Units per milligram from the expression:

$$\frac{n \times m_1}{n_1 \times m} \times A$$

- n = average volume of 0.1 M sodium hydroxide used per minute during the titration of the test suspension,
- n_1 = average volume of 0.1 M sodium hydroxide used per minute during the titration of the reference suspension,
- m = mass in milligrams of the substance to be examined,
- m_1 = mass in milligrams of the reference preparation,
- A = activity of *pancreas powder (amylase and lipase) BRP* in Ph. Eur. Units per milligram.

Amylolytic activity. The amylolytic activity is determined by comparing the rate at which a suspension of pancreas powder hydrolyses a substrate of starch solution with the rate at which a suspension of *pancreas powder (amylase and lipase) BRP* hydrolyses the same substrate under the same conditions.

Starch solution. To a quantity of *starch BRP* equivalent to 2.0 g of the dried substance add 10 ml of *water R* and mix. (Determine the water content of *starch BRP* prior to the test by heating at 120 °C for 4 h). Add this suspension, whilst stirring continuously, to 160 ml of boiling *water R*. Wash the container several times with successive quantities, each of 10 ml, of *water R* and add the washings to the hot starch solution. Heat to boiling, stirring continuously. Cool to room temperature and dilute to 200 ml with *water R*. Use the solution on the day of preparation.

For the test suspension and the reference suspension, prepare the suspension and carry out the dilution at 0 °C to 4 °C.

Test suspension. Triturate a quantity of the substance to be examined equivalent to about 1500 Ph. Eur. U. of amylolytic activity with 60 ml of *phosphate buffer solution pH 6.8 R1* for 15 min. Transfer quantitatively to a volumetric flask and dilute to 100.0 ml with *phosphate buffer solution pH 6.8 R1*.

Reference suspension. Prepare a suspension of *pancreas powder (amylase and lipase) BRP* as described for the test suspension, using a quantity equivalent to about 1500 Ph. Eur. U.

In a test tube 200 mm long and 22 mm in diameter, fitted with a ground-glass stopper, place 25.0 ml of starch solution, 10.0 ml of *phosphate buffer solution pH 6.8 R1* and 1.0 ml of a 11.7 g/l solution of *sodium chloride R*. Close the tube, shake and place in a water-bath at 25.0 ± 0.1 °C. When the temperature equilibrium has been reached, add 1.0 ml of the test suspension and start the chronometer. Mix and place the tube in the water-bath. After exactly 10 min, add 2 ml of 1 M hydrochloric acid. Transfer the mixture quantitatively to a 300 ml conical flask fitted with a ground-glass stopper. Whilst shaking continuously, add 10.0 ml of 0.05 M iodine and immediately, 45 ml of 0.1 M sodium hydroxide. Allow to stand in the dark at a temperature between 15 °C and 25 °C for 15 min. Add 4 ml of a mixture of 1 volume of sulphuric acid R and 4 volumes of *water R*. Titrate the excess of iodine with 0.1 M sodium thiosulphate using a microburette. Carry out a blank titration adding the 2 ml of 1 M hydrochloric acid before introducing the test suspension. Carry out the titration of the reference suspension in the same manner.

Calculate the amylolytic activity in Ph. Eur. Units per milligram from the expression:

$$\frac{(n' - n) m_1}{(n'_1 - n_1) m} \times A$$

- n = number of millilitres of 0.1 M sodium thiosulphate used in the titration of the test suspension,
 n_1 = number of millilitres of 0.1 M sodium thiosulphate used in the titration of the reference suspension,
 n' = number of millilitres of 0.1 M sodium thiosulphate used in the blank titration of the test suspension,
 n'_1 = number of millilitres of 0.1 M sodium thiosulphate used in the blank titration of the reference suspension,
 m = mass in milligrams of the substance to be examined,
 m_1 = mass in milligrams of the reference preparation,
 A = activity of pancreas powder (amylase and lipase) BRP in Ph. Eur. Units per milligram.

STORAGE

Store in an airtight container, at a temperature of 2 °C to 8 °C.

01/2005:0681

PANCURONIUM BROMIDE

Pancuronii bromidum

$C_{35}H_{60}Br_2N_2O_4$

M_r 733

DEFINITION

1,1'-[3 α ,17 β -Bis(acetyloxy)-5 α -androstane-2 β ,16 β -diyl]bis(1-methylpiperidinium) dibromide.

Content: 98.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder, hygroscopic.

Solubility: very soluble to freely soluble in water, very soluble in methylene chloride, freely soluble in alcohol.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: pancuronium bromide CRS.

B. Examine the chromatograms obtained in the test for related substances.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. It gives reaction (a) of bromides (2.3.1).

TESTS

Appearance of solution. The solution is clear (2.2.1) and colourless (2.2.2, Method II).

Dissolve 50 mg in water R and dilute to 25 ml with the same solvent.

Specific optical rotation (2.2.7): + 38 to + 42 (anhydrous substance).

Dissolve 0.75 g in water R and dilute to 25.0 ml with the same solvent.

Related substances. Thin-layer chromatography (2.2.27). Prepare the solutions immediately before use.

Test solution. Dissolve 50 mg of the substance to be examined in methylene chloride R and dilute to 5 ml with the same solvent.

Reference solution (a). Dissolve 50 mg of pancuronium bromide CRS in methylene chloride R and dilute to 5 ml with the same solvent.

Reference solution (b). Dilute 0.1 ml of the test solution to 20 ml with methylene chloride R.

Reference solution (c). Dissolve 5 mg of pancuronium impurity A CRS in methylene chloride R and dilute to 50 ml with the same solvent.

Reference solution (d). Dissolve 5 mg of pancuronium bromide CRS in 1 ml of reference solution (c).

Plate: TLC silica gel plate R.

Mobile phase: 400 g/l solution of sodium iodide R, acetonitrile R, 2-propanol R (5:10:85 V/V/V).

Application: 2 μ l.

Development: in an unlined and unsaturated tank over a path of 12 cm.

Drying: in a current of cold air.

Detection: expose the plate to iodine vapour for about 10 min and cover the plate with a glass plate.

System suitability:

- the chromatogram obtained with reference solution (d) shows 2 distinct spots and the ratio of the R_f values of impurity A and of pancuronium bromide is at least 1.2,
- a spot is clearly visible in the chromatogram obtained with reference solution (b).

Limits:

- **impurity A:** any spot corresponding to impurity A is not more intense than the principal spot in the chromatogram obtained with reference solution (c) (1.0 per cent),
- **any other impurity:** any spot, apart from the principal spot and any spot corresponding to impurity A, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Water (2.5.12): maximum 8.0 per cent, determined on 0.300 g.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.2000 g in 50 ml of acetic anhydride R, heating if necessary. Titrate with 0.1 M perchloric acid, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M perchloric acid is equivalent to 36.63 mg of $C_{35}H_{60}Br_2N_2O_4$.

STORAGE

In an airtight container, protected from light.

IMPURITIES

- A. R1 = CO-CH₃, R2 = H: 1,1'-[3 α -(acetyloxy)-17 β -hydroxy-5 α -androstane-2 β ,16 β -diyl]bis(1-methylpiperidinium) dibromide (dacuronium bromide),
- B. R1 = H, R2 = CO-CH₃: 1,1'-[17 β -(acetyloxy)-3 α -hydroxy-5 α -androstane-2 β ,16 β -diyl]bis(1-methylpiperidinium) dibromide,
- C. R1 = R2 = H: 1,1'-(3 α ,17 β -dihydroxy-5 α -androstane-2 β ,16 β -diyl)bis(1-methylpiperidinium) dibromide.

PAPAVERINE HYDROCHLORIDE

Papaverini hydrochloridum

C₂₀H₂₂ClNO₄

M_r 375.9

DEFINITION

1-(3,4-Dimethoxybenzyl)-6,7-dimethoxyisoquinoline hydrochloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or white or almost white crystals.

Solubility: sparingly soluble in water, slightly soluble in alcohol.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: papaverine hydrochloride CRS.

B. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 5 mg of the substance to be examined in methanol R and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 5 mg of papaverine hydrochloride CRS in methanol R and dilute to 10 ml with the same solvent.

Plate: TLC silica gel GF₂₅₄ plate R.

Mobile phase: diethylamine R, ethyl acetate R, toluene R (10:20:70 V/V/V).

Application: 10 μ l.

Development: over 2/3 of the plate.

Drying: at 100-105 °C for 2 h.

Detection: examine in ultraviolet light at 254 nm.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

C. To 10 ml of solution S (see Tests) add 5 ml of ammonia R dropwise and allow to stand for 10 min. The precipitate, washed and dried, melts (2.2.14) at 146 °C to 149 °C.

D. It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 0.4 g in carbon dioxide-free water R, heating gently if necessary, and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, Method II).

pH (2.2.3): 3.0 to 4.0 for solution S.

Related substances. Liquid chromatography (2.2.29).

Solvent mixture: acetonitrile R, mobile phase A (20:80 V/V).

Test solution. Dissolve 20.0 mg of the substance to be examined in the solvent mixture and dilute to 10.0 ml with the solvent mixture.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of this solution to 10.0 ml with the solvent mixture.

Reference solution (b). Dissolve 12 mg of noscapine CRS in 1.0 ml of the test solution and dilute to 100.0 ml with the solvent mixture.

Column:

– size: l = 0.25 m, $\varnothing$ = 4.0 mm,

– stationary phase: base-deactivated octylsilyl silica gel for chromatography R (5 μ m).

Mobile phase:

– mobile phase A: 3.4 g/l solution of potassium dihydrogen phosphate R adjusted to pH 3.0 with dilute phosphoric acid R,

– mobile phase B: acetonitrile R,

– mobile phase C: methanol R,

Time (min)	Mobile phase A (per cent V/V/V)	Mobile phase B (per cent V/V/V)	Mobile phase C (per cent V/V/V)
0 - 5	85	5	10
5 - 12	85 $\rightarrow$ 60	5	10 $\rightarrow$ 35
12 - 20	60	5	35
20 - 24	60 $\rightarrow$ 40	5 $\rightarrow$ 20	35 $\rightarrow$ 40
24 - 27	40	20	40
27 - 32	40 $\rightarrow$ 85	20 $\rightarrow$ 5	40 $\rightarrow$ 10
32 - 40	85	5	10

Flow rate: 1 ml/min.

Detection: spectrophotometer at 238 nm.

Injection: 10 μ l.

Relative retention with reference to papaverine (retention time = about 23.4 min): impurity E = about 0.7; impurity C = about 0.75; impurity B = about 0.8; impurity A = about 0.9; impurity F = about 1.1; impurity D = about 1.2.

System suitability: reference solution (b):

- *resolution:* minimum 1.5 between the peaks due to impurity A and papaverine.

Limits:

- *correction factors:* for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity C = 2.7; impurity D = 0.5; impurity A = 6.2;
- *any impurity:* not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
- *total:* not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);
- *disregard limit:* 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on the residue from the test for loss on drying.

ASSAY

Dissolve 0.300 g in a mixture of 5.0 ml of 0.01 M hydrochloric acid and 50 ml of alcohol R. Carry out a potentiometric titration (2.2.20), using 0.1 M sodium hydroxide. Read the volume added between the 2 points of inflexion.

1 ml of 0.1 M sodium hydroxide is equivalent to 37.59 mg of $C_{20}H_{22}ClNO_4$.

IMPURITIES

A. noscapine,

B. R = OH, R' = H: (RS)-(3,4-dimethoxyphenyl)(6,7-dimethoxyisoquinolin-1-yl)methanol (papaverinol),

D. R + R' = O: (3,4-dimethoxyphenyl)(6,7-dimethoxyisoquinolin-1-yl)methanone (papaveraldine),

C. 1-(3,4-dimethoxybenzyl)-6,7-dimethoxy-3,4-dihydroisoquinoline (dihydropapaverine),

E. (1RS)-1-(3,4-dimethoxybenzyl)-6,7-dimethoxy-1,2,3,4-tetrahydroisoquinoline (tetrahydropapaverine),

F. 2-(3,4-dimethoxyphenyl)-N-[2-(3,4-dimethoxyphenyl)ethyl]acetamide.

01/2005:0049

PARACETAMOL

Paracetamolum

$C_8H_9NO_2$

M_r 151.2

DEFINITION

N-(4-Hydroxyphenyl)acetamide.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white, crystalline powder.

Solubility: sparingly soluble in water, freely soluble in alcohol, very slightly soluble in methylene chloride.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D, E.

A. Melting point (2.2.14): 168 °C to 172 °C.

B. Dissolve 0.1 g in methanol R and dilute to 100.0 ml with the same solvent. To 1.0 ml of the solution add 0.5 ml of a 10.3 g/l solution of hydrochloric acid R and dilute to 100.0 ml with methanol R. Protect the solution from bright light and immediately measure the absorbance (2.2.25) at the absorption maximum at 249 nm. The specific absorbance at the maximum is 860 to 980.

C. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: paracetamol CRS.

D. To 0.1 g add 1 ml of hydrochloric acid R, heat to boiling for 3 min, add 1 ml of water R and cool in an ice bath. No precipitate is formed. Add 0.05 ml of a 4.9 g/l solution of potassium dichromate R. A violet colour develops which does not change to red.

E. It gives the reaction of acetyl (2.3.1). Heat over a naked flame.

TESTS

Related substances. Liquid chromatography (2.2.29).

Prepare the solutions immediately before use.

Test solution. Dissolve 0.200 g of the substance to be examined in 2.5 ml of methanol R containing 4.6 g/l of a 400 g/l solution of tetrabutylammonium hydroxide R and dilute to 10.0 ml with a mixture of equal volumes of a 17.9 g/l solution of disodium hydrogen phosphate R and of a 7.8 g/l solution of sodium dihydrogen phosphate R.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 5.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the mobile phase.

Reference solution (c). Dissolve 5.0 mg of 4-aminophenol *R*, 5 mg of paracetamol *CRS* and 5.0 mg of chloroacetanilide *R* in methanol *R* and dilute to 20.0 ml with the same solvent. Dilute 1.0 ml to 250.0 ml with the mobile phase.

Reference solution (d). Dissolve 20.0 mg of 4-nitrophenol *R* in methanol *R* and dilute to 50.0 ml with the same solvent. Dilute 1.0 ml to 20.0 ml with the mobile phase.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** octylsilyl silica gel for chromatography *R* (5 μ m),
- **temperature:** 35 °C.

Mobile phase: mix 375 volumes of a 17.9 g/l solution of disodium hydrogen phosphate *R*, 375 volumes of a 7.8 g/l solution of sodium dihydrogen phosphate *R* and 250 volumes of methanol *R* containing 4.6 g/l of a 400 g/l solution of tetrabutylammonium hydroxide *R*.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 245 nm.

Injection: 20 μ l.

Run time: 12 times the retention time of paracetamol.

Relative retentions with reference to paracetamol (retention time = about 4 min): impurity K = about 0.8; impurity F = about 3; impurity J = about 7.

System suitability: reference solution (c):

- **resolution:** minimum 4.0 between the peaks due to impurity K and to paracetamol,
- **signal-to-noise ratio:** minimum 50 for the peak due to impurity J.

Limits:

- **impurity J:** not more than 0.2 times the area of the corresponding peak in the chromatogram obtained with reference solution (c) (10 ppm),
- **impurity K:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (50 ppm),
- **impurity F:** not more than half the area of the corresponding peak in the chromatogram obtained with reference solution (d) (0.05 per cent),
- **any other impurity:** not more than half the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent),
- **total of other impurities:** not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- **disregard limit** for the calculation of the total of other impurities: the area of the principal peak in the chromatogram obtained with reference solution (b) (0.01 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

Dissolve 1.0 g in a mixture of 15 volumes of water *R* and 85 volumes of acetone *R* and dilute to 20 ml with the same mixture of solvents. 12 ml of the solution complies with limit test B. Prepare the standard using lead standard solution (1 ppm Pb) obtained by diluting lead standard solution (100 ppm Pb) *R* with a mixture of 15 volumes of water *R* and 85 volumes of acetone *R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in a mixture of 10 ml of water *R* and 30 ml of dilute sulphuric acid *R*. Boil under a reflux condenser for 1 h, cool and dilute to 100.0 ml with water *R*. To 20.0 ml of the solution add 40 ml of water *R*, 40 g of ice, 15 ml of dilute hydrochloric acid *R* and 0.1 ml of ferroin *R*. Titrate with 0.1 M cerium sulphate until a greenish-yellow colour is obtained. Carry out a blank titration.

1 ml of 0.1 M cerium sulphate is equivalent to 7.56 mg of $C_8H_9NO_2$.

STORAGE

Protected from light.

IMPURITIES

A. $R_1 = R_3 = R_4 = H$, $R_2 = OH$: *N*-(2-hydroxyphenyl)acetamide,

B. $R_1 = CH_3$, $R_2 = R_3 = H$, $R_4 = OH$: *N*-(4-hydroxyphenyl)propanamide,

C. $R_1 = R_2 = H$, $R_3 = Cl$, $R_4 = OH$: *N*-(3-chloro-4-hydroxyphenyl)acetamide,

D. $R_1 = R_2 = R_3 = R_4 = H$: *N*-phenylacetamide,

H. $R_1 = R_2 = R_3 = H$, $R_4 = O-CO-CH_3$: 4-(acetylamino)phenyl acetate,

J. $R_1 = R_2 = R_3 = H$, $R_4 = Cl$: *N*-(4-chlorophenyl)acetamide (chloroacetanilide),

E. $X = O$, $R_2 = H$, $R_4 = OH$: 1-(4-hydroxyphenyl)ethanone,

G. $X = N-OH$, $R_2 = H$, $R_4 = OH$: 1-(4-hydroxyphenyl)ethanone oxime,

I. $X = O$, $R_2 = OH$, $R_4 = H$: 1-(2-hydroxyphenyl)ethanone,

F. $R = NO_2$: 4-nitrophenol,

K. $R = NH_2$: 4-aminophenol.

01/2005:0240

PARAFFIN, HARD**Paraffinum solidum****DEFINITION**

Hard paraffin is a purified mixture of solid saturated hydrocarbons generally obtained from petroleum. It may contain a suitable antioxidant.

CHARACTERS

A colourless or white mass, practically insoluble in water, freely soluble in methylene chloride, practically insoluble in alcohol. The melted substance is free from fluorescence in daylight.

IDENTIFICATION

First identification: A, C.

Second identification: B, C.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of hard paraffin*.
- B. It complies with the test for acidity or alkalinity (see Tests).
- C. Melting point (2.2.16): 50 °C to 61 °C.

TESTS

Acidity or alkalinity. To 15 g add 30 ml of boiling *water R* and shake vigorously for 1 min. Allow to cool and to separate. To 10 ml of the aqueous layer add 0.1 ml of *phenolphthalein solution R*. The solution is colourless. Not more than 1.0 ml of 0.01 M *sodium hydroxide* is required to change the colour of the indicator to red. To a further 10 ml of the aqueous layer add 0.1 ml of *methyl red solution R*. The solution is yellow. Not more than 0.5 ml of 0.01 M *hydrochloric acid* is required to change the colour of the indicator to red.

Polycyclic aromatic hydrocarbons. *Use reagents for ultraviolet absorption spectrophotometry.* Dissolve 0.50 g in 25 ml of *heptane R* and place in a 125 ml separating funnel with unlubricated ground-glass parts (stopper, stopcock). Add 5.0 ml of *dimethyl sulphoxide R*. Shake vigorously for 1 min and allow to stand until two clear layers are formed. Transfer the lower layer to a second separating funnel, add 2 ml of *heptane R* and shake the mixture vigorously. Allow to stand until two clear layers are formed. Separate the lower layer and measure its absorbance (2.2.25) between 265 nm and 420 nm using as the compensation liquid the clear lower layer obtained by vigorously shaking 5.0 ml of *dimethyl sulphoxide R* with 25 ml of *heptane R* for 1 min. Prepare a 7.0 mg/l reference solution of *naphthalene R* in *dimethyl sulphoxide R* and measure the absorbance of this solution at the maximum at 278 nm using *dimethyl sulphoxide R* as the compensation liquid. At wavelengths from 265 nm to 420 nm, the absorbance of the test solution is not greater than one-third that of the reference solution at 278 nm.

Sulphates (2.4.13). Introduce 2.0 g of the melted substance to be examined into a 50 ml ground-glass-stoppered separating funnel. Add 30 ml of boiling *distilled water R* and shake vigorously for 1 min. Filter. 15 ml of the filtrate complies with the limit test for sulphates (150 ppm).

STORAGE

Store protected from light.

LABELLING

The label states, where applicable, the name and concentration of any added antioxidant.

PARAFFIN, LIGHT LIQUID**Paraffinum perliquidum****DEFINITION**

Light liquid paraffin is a purified mixture of liquid saturated hydrocarbons obtained from petroleum.

CHARACTERS

A colourless, transparent, oily liquid, free from fluorescence in daylight. Practically insoluble in water, slightly soluble in ethanol (96 per cent), miscible with hydrocarbons.

IDENTIFICATION

First identification: A, C.

Second identification: B, C.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of liquid paraffin*.
- B. In a test tube cautiously boil 1 ml with 1 ml of 0.1 M *sodium hydroxide*, with continuous shaking, for about 30 s. On cooling to room temperature, 2 phases separate. To the aqueous phase add 0.1 ml of *phenolphthalein solution R*. The colour turns to red.
- C. It complies with the test for viscosity (see Tests).

TESTS

Acidity or alkalinity. To 10 ml add 20 ml of boiling *water R* and shake vigorously for 1 min. Separate the aqueous layer and filter. To 10 ml of the filtrate, add 0.1 ml of *phenolphthalein solution R*. The solution is colourless. Not more than 0.1 ml of 0.1 M *sodium hydroxide* is required to change the colour of the indicator to pink.

Relative density (2.2.5): 0.810 to 0.875.

Viscosity (2.2.9): 25 mPa·s to 80 mPa·s.

Polycyclic aromatic hydrocarbons. *Use reagents for ultraviolet spectrophotometry.*

Introduce 25.0 ml into a 125 ml separating funnel with unlubricated ground-glass parts (stopper, stopcock). Add 25 ml of *hexane R* which has been previously shaken twice with one-fifth its volume of *dimethyl sulphoxide R*. Mix and add 5.0 ml of *dimethyl sulphoxide R*. Shake vigorously for 1 min and allow to stand until 2 clear layers are formed. Transfer the lower layer to a second separating funnel, add 2 ml of *hexane R* and shake the mixture vigorously. Allow to stand until 2 clear layers are formed. Separate the lower layer and measure its absorbance (2.2.25) between 260 nm and 420 nm, using as the compensation liquid the clear lower layer obtained by vigorously shaking 5.0 ml of *dimethyl sulphoxide R* with 25 ml of *hexane R* for 1 min. Prepare a 7.0 mg/l reference solution of *naphthalene R* in *trimethylpentane R* and measure the absorbance of the solution at the maximum at 275 nm, using *trimethylpentane R* as the compensation liquid. At no wavelength between 260 nm and 420 nm does the absorbance of the test solution exceed one-third that of the reference solution at 275 nm.

Readily carbonisable substances. Use a ground-glass-stoppered tube about 125 mm long and 18 mm in internal diameter, graduated at 5 ml and 10 ml; wash with hot *water R* (temperature at least 60 °C), *acetone R*, *heptane R* and finally with *acetone R*, dry at 100–110 °C. Cool in a desiccator. Introduce 5 ml of the substance to be examined and add 5 ml of *nitrogen-free sulphuric acid R1*. Insert the stopper and shake as vigorously as possible, in the

longitudinal direction of the tube, for 5 s. Loosen the stopper, immediately place the tube in a water-bath, avoiding contact of the tube with the bottom or side of the bath, and heat for 10 min. After 2 min, 4 min, 6 min and 8 min, remove the tube from the bath and shake as vigorously as possible, in the longitudinal direction of the tube for 5 s. At the end of 10 min of heating, remove the tube from the water-bath and allow to stand for 10 min. Centrifuge at 2000 *g* for 5 min. The lower layer is not more intensely coloured (2.2.2, *Method I*) than a mixture of 0.5 ml of blue primary solution, 1.5 ml of red primary solution, 3.0 ml of yellow primary solution and 2 ml of a 10 g/l solution of *hydrochloric acid R*.

Solid paraffins. Dry a suitable quantity of the substance to be examined by heating at 100 °C for 2 h and cool in a desiccator over *sulphuric acid R*. Place in a glass tube with an internal diameter of about 25 mm, close the tube and immerse in a bath of iced water. After 4 h, the liquid is sufficiently clear for a black line, 0.5 mm wide, to be easily seen against a white background held vertically behind the tube.

STORAGE

Protected from light.

PARAFFIN, LIQUID

Paraffinum liquidum

DEFINITION

Liquid paraffin is a purified mixture of liquid saturated hydrocarbons obtained from petroleum.

CHARACTERS

A colourless, transparent, oily liquid, free from fluorescence in daylight. Practically insoluble in water, slightly soluble in ethanol (96 per cent), miscible with hydrocarbons.

IDENTIFICATION

First identification: A, C.

Second identification: B, C.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of liquid paraffin*.
- B. In a test tube cautiously boil 1 ml with 1 ml of 0.1 *M* sodium hydroxide, with continuous shaking, for about 30 s. On cooling to room temperature, 2 phases separate. To the aqueous phase add 0.1 ml of *phenolphthalein solution R*. The colour turns to red.
- C. It complies with the test for viscosity (see Tests).

TESTS

Acidity or alkalinity. To 10 ml add 20 ml of boiling *water R* and shake vigorously for 1 min. Separate the aqueous layer and filter. To 10 ml of the filtrate, add 0.1 ml of *phenolphthalein solution R*. The solution is colourless. Not more than 0.1 ml of 0.1 *M* sodium hydroxide is required to change the colour of the indicator to pink.

Relative density (2.2.5): 0.827 to 0.890.

Viscosity (2.2.9): 110 mPas to 230 mPas.

Polycyclic aromatic hydrocarbons. Use reagents for ultraviolet spectrophotometry.

Introduce 25.0 ml into a 125 ml separating funnel with unlubricated ground-glass parts (stopper, stopcock). Add

25 ml of *hexane R* which has been previously shaken twice with one-fifth its volume of *dimethyl sulphoxide R*. Mix and add 5.0 ml of *dimethyl sulphoxide R*. Shake vigorously for 1 min and allow to stand until 2 clear layers are formed. Transfer the lower layer to a second separating funnel, add 2 ml of *hexane R* and shake the mixture vigorously. Allow to stand until 2 clear layers are formed. Separate the lower layer and measure its absorbance (2.2.25) between 260 nm and 420 nm, using as the compensation liquid the clear lower layer obtained by vigorously shaking 5.0 ml of *dimethyl sulphoxide R* with 25 ml of *hexane R* for 1 min. Prepare a 7.0 mg/l reference solution of *naphthalene R* in *trimethylpentane R* and measure the absorbance of the solution at the maximum at 275 nm, using *trimethylpentane R* as the compensation liquid. At no wavelength between 260 nm and 420 nm does the absorbance of the test solution exceed one-third that of the reference solution at 275 nm.

Readily carbonisable substances. Use a ground-glass-stoppered tube about 125 mm long and 18 mm in internal diameter, graduated at 5 ml and 10 ml; wash with hot *water R* (temperature at least 60 °C), *acetone R*, *heptane R* and finally with *acetone R*, dry at 100–110 °C. Cool in a desiccator. Introduce 5 ml of the substance to be examined and add 5 ml of *nitrogen-free sulphuric acid R1*. Insert the stopper and shake as vigorously as possible, in the longitudinal direction of the tube, for 5 s. Loosen the stopper, immediately place the tube in a water-bath, avoiding contact of the tube with the bottom or side of the bath, and heat for 10 min. After 2 min, 4 min, 6 min and 8 min, remove the tube from the bath and shake as vigorously as possible, in the longitudinal direction of the tube for 5 s. At the end of 10 min of heating, remove the tube from the water-bath and allow to stand for 10 min. Centrifuge at 2000 *g* for 5 min. The lower layer is not more intensely coloured (2.2.2, *Method I*) than a mixture of 0.5 ml of blue primary solution, 1.5 ml of red primary solution, 3.0 ml of yellow primary solution and 2 ml of a 10 g/l solution of *hydrochloric acid R*.

Solid paraffins. Dry a suitable quantity of the substance to be examined by heating at 100 °C for 2 h and cool in a desiccator over *sulphuric acid R*. Place in a glass tube with an internal diameter of about 25 mm, close the tube and immerse in a bath of iced water. After 4 h, the liquid is sufficiently clear for a black line, 0.5 mm wide, to be easily seen against a white background held vertically behind the tube.

01/2005:1799

PARAFFIN, WHITE SOFT

Vaselinum album

DEFINITION

Purified and wholly or nearly decolorised mixture of semi-solid hydrocarbons, obtained from petroleum. It may contain a suitable antioxidant. White soft paraffin described in this monograph is not suitable for oral use.

CHARACTERS

Appearance: white or almost white, translucent, soft unctuous mass, slightly fluorescent in daylight when melted.
Solubility: practically insoluble in water, soluble in methylene chloride, practically insoluble in alcohol and in glycerol.

IDENTIFICATION

First identification: A, B, D.

Second identification: A, C, D.

A. The drop point is between 35 °C and 70 °C and does not differ by more than 5 °C from the value stated on the label, according to method (2.2.17) with the following modification to fill the cup: heat the substance to be examined at a temperature not exceeding 80 °C, with stirring to ensure uniformity. Warm the metal cup at a temperature not exceeding 80 °C in an oven, remove it from the oven, place on a clean plate or ceramic tile and pour a sufficient quantity of the melted sample into the cup to fill it completely. Allow the filled cup to cool for 30 min on the plate or the ceramic tile and place it in a water bath at 24-26 °C for 30-40 min. Level the surface of the sample with a single stroke of a knife or razor blade, avoiding compression of the sample.

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of white soft paraffin.

C. Melt 2 g and when a homogeneous phase is obtained, add 2 ml of *water R* and 0.2 ml of 0.05 M *iodine*. Shake. Allow to cool. The solid upper layer is violet-pink.

D. It complies with the test for appearance (see Tests).

TESTS

Appearance. The substance is white. Melt 12 g on a water-bath. The melted mass is not more intensely coloured than a mixture of 1 volume of yellow primary solution and 9 volumes of a 1 per cent *m/V* solution of *hydrochloric acid R* (2.2.2, *Method II*).

Acidity or alkalinity. To 10 g add 20 ml of boiling *water R* and shake vigorously for 1 min. Allow to cool and decant. To 10 ml of the aqueous layer add 0.1 ml of *phenolphthalein solution R*. The solution is colourless. Not more than 0.5 ml of 0.01 M *sodium hydroxide* is required to change the colour of the indicator to red.

Consistency (2.9.9): 60 to 300.

Polycyclic aromatic hydrocarbons: maximum 300 ppm.

Use reagents for ultraviolet spectrophotometry. Dissolve 1.0 g in 50 ml of *hexane R* which has been previously shaken twice with 10 ml of *dimethyl sulphoxide R*. Transfer the solution to a 125 ml separating funnel with unlubricated ground-glass parts (stopper, stopcock). Add 20 ml of *dimethyl sulphoxide R*. Shake vigorously for 1 min and allow to stand until 2 clear layers are formed. Transfer the lower layer to a second separating funnel. Repeat the extraction with a further 20 ml of *dimethyl sulphoxide R*. Shake vigorously the combined lower layers with 20 ml of *hexane R* for 1 min. Allow to stand until 2 clear layers are formed. Separate the lower layer and dilute to 50.0 ml with *dimethyl sulphoxide R*. Measure the absorbance (2.2.25) over the range 260 nm to 420 nm using a path length of 4 cm and as compensation liquid the clear lower layer obtained by vigorously shaking 10 ml of *dimethyl sulphoxide R* with 25 ml of *hexane R* for 1 min. Prepare a reference solution in *dimethyl sulphoxide R* containing 6.0 mg of *naphthalene R* per litre and measure the absorbance of the solution at the maximum at 278 nm using a path length of 4 cm and *dimethyl sulphoxide R* as compensation liquid. At no wavelength in the range 260 nm to 420 nm does the absorbance of the test solution exceed that of the reference solution at 278 nm.

Sulphated ash (2.4.14): maximum 0.05 per cent, determined on 2.0 g.

STORAGE

Protected from light.

LABELLING

The label states:

- the nominal drop point,
- where applicable, the name and concentration of any added antioxidant.

01/2005:1554

PARAFFIN, YELLOW SOFT

Vaselinum flavum

DEFINITION

Yellow soft paraffin is a purified mixture of semi-solid hydrocarbons, obtained from petroleum. It may contain a suitable antioxidant.

CHARACTERS

A yellow, translucent, unctuous mass, slightly fluorescent in daylight when melted, practically insoluble in water, soluble in methylene chloride, practically insoluble in alcohol and in glycerol.

IDENTIFICATION

First identification: A, B, D.

Second identification: A, C, D.

A. The drop point (2.2.17) is 40 °C to 60 °C and does not differ by more than 5 °C from the value stated on the label, with the following modification to fill the cup: heat the substance to be examined at 118 °C to 122 °C, with stirring to ensure uniformity, then cool to 100 °C to 107 °C. Warm the metal cup at 103 °C to 107 °C in an oven, remove it from the oven, place on a clean plate or ceramic tile and pour a sufficient quantity of the melted sample into the cup to fill it completely. Allow the filled cup to cool for 30 min on the ceramic tile and place it in a water-bath at 24 °C to 26 °C for a further 30 min to 40 min. Level the surface of the sample with a single stroke of a knife or razor blade, avoiding compression of the sample.

B. Examine by infrared absorption spectrophotometry (2.2.24) comparing with the *Ph. Eur. reference spectrum of yellow soft paraffin*. The spectrum obtained shows major peaks similar in position and intensity to the *Ph. Eur. reference spectrum*.

C. Melt 2 g and when a homogenous phase is obtained, add 2 ml of *water R* and 0.2 ml of 0.05 M *iodine*. Shake. Allow to cool. The solid upper layer is violet-pink.

D. It complies with the test for appearance (see Tests).

TESTS

Appearance. The substance is yellow. Melt 12 g on a water-bath. The melted mass is not more intensely coloured than a mixture of 7.6 volumes of yellow primary solution and 2.4 volumes of red primary solution (2.2.2, *Method II*).

Acidity or alkalinity. To 10 g add 20 ml of boiling *water R* and shake vigorously for 1 min. Allow to cool and decant. To 10 ml of the aqueous layer add 0.1 ml of *phenolphthalein solution R*. The solution is colourless. Not more than 0.5 ml of 0.01 M *sodium hydroxide* is required to change the colour of the indicator to red.

Consistency (2.9.9). The consistency is 100 to 300.

Polycyclic aromatic hydrocarbons. Use reagents for ultraviolet absorption spectrophotometry. Dissolve 1.0 g in 50 ml of *hexane R* which has been previously shaken twice with one-fifth its volume of *dimethyl sulphoxide R*. Transfer the solution to a 125 ml separating funnel with unlubricated ground-glass parts (stopper, stopcock). Add 20 ml of *dimethyl sulphoxide R*. Shake vigorously for 1 min and allow to stand until two clear layers are formed. Transfer the lower layer to a second separating funnel. Repeat the extraction with a further 20 ml of *dimethyl sulphoxide R*. Shake vigorously the combined lower layers with 20 ml of *hexane R* for 1 min. Allow to stand until two clear layers are formed. Separate the lower layer and dilute to 50.0 ml with *dimethyl sulphoxide R*. Measure the absorbance (2.2.25) between 260 nm and 420 nm using a path length of 4 cm and using as the compensation liquid the clear lower layer obtained by vigorously shaking 10 ml of *dimethyl sulphoxide R* with 25 ml of *hexane R* for 1 min. Prepare a 9.0 mg/l reference solution of *naphthalene R* in *dimethyl sulphoxide R* and measure the absorbance of this solution at the maximum at 278 nm using a path length of 4 cm and using *dimethyl sulphoxide R* as the compensation liquid. At no wavelength in the range of 260 nm to 420 nm does the absorbance of the test solution exceed that of the reference solution at 278 nm.

Sulphated ash (2.4.14). Not more than 0.05 per cent, determined on 2.0 g.

STORAGE

Store protected from light.

LABELLING

The label states:

- the nominal drop point,
- where applicable, the name and concentration of any added antioxidant.

01/2005:0351

PARALDEHYDE

Paraldehydum

 $C_6H_{12}O_3$
 M_r 132.2

DEFINITION

Paraldehyde is 2,4,6-trimethyl-1,3,5-trioxane, the cyclic trimer of acetaldehyde. It may contain a suitable quantity of an antioxidant.

CHARACTERS

A colourless or slightly yellow, transparent liquid. It solidifies on cooling to form a crystalline mass. Soluble in water, but less soluble in boiling water, miscible with alcohol and with essential oils.

IDENTIFICATION

- Solution S (see Tests) is clear (2.2.1) but becomes turbid on warming.
- To 5 ml add 0.1 ml of *dilute sulphuric acid R* and heat. Acetaldehyde, recognisable by its odour, is evolved.

- To 5 ml of solution S in a test-tube add 5 ml of *ammoniacal silver nitrate solution R* and heat in a water-bath. Silver is deposited as a mirror on the wall of the tube.

TESTS

Solution S. Dissolve 20.0 ml in *carbon dioxide-free water R* and dilute to 200.0 ml with the same solvent.

Acidity. To 50.0 ml of solution S add 0.05 ml of *phenolphthalein solution R*. Not more than 1.5 ml of 0.1 M *sodium hydroxide* is required to change the colour of the indicator.

Refractive index (2.2.6): 1.403 to 1.406.

Relative density (2.2.5): 0.991 to 0.996.

Distillation range (2.2.11). Not more than 10 per cent distils below 123 °C and not less than 95 per cent distils below 126 °C.

Freezing point (2.2.18): 10 °C to 13 °C.

Acetaldehyde. To 5.0 ml add a mixture of 0.2 ml of *methyl orange solution R*, 5 ml of *alcohol (60 per cent V/V) R* and 5 ml of *alcoholic hydroxylamine solution R* and shake. Not more than 0.8 ml of 0.5 M *sodium hydroxide* is required to change the colour of the indicator to pure yellow.

Peroxides. Place 50.0 ml of solution S in a ground-glass-stoppered flask, add 5 ml of *dilute sulphuric acid R* and 10 ml of *potassium iodide solution R*, close the flask and allow to stand protected from light for 15 min. Titrate with 0.1 M *sodium thiosulphate* using 1 ml of *starch solution R* as indicator. Allow to stand for 5 min and, if necessary complete the titration. Not more than 2.0 ml of 0.1 M *sodium thiosulphate* is required.

Non-volatile residue. Heat 5.0 ml in a tared evaporating dish on a water-bath and dry at 105 °C for 1 h. The residue weighs not more than 3 mg (0.6 g/l).

STORAGE

Store in a small, well-filled, airtight container, protected from light. If the substance has solidified the whole contents of the container must be liquefied before use.

LABELLING

The label states the name and quantity of any added antioxidant.

01/2005:1252

PARNAPARIN SODIUM

Parnaparinum natricum

$n = 1$ to 21, $R = H$ or SO_3Na , $R' = SO_3Na$ or $CO-CH_3$
 $R_2 = H$ and $R_3 = CO_2Na$ or $R_2 = CO_2Na$ and $R_3 = H$

DEFINITION

Sodium salt of a low-molecular-mass heparin that is obtained by radical-catalysed depolymerisation, with hydrogen peroxide and with a cupric salt, of heparin from bovine or porcine intestinal mucosa. The majority of the components have a 2-*O*-sulpho- α -L-idopyranosuronic acid structure at the non-reducing end and a 2-*N*,6-*O*-disulpho-D-glucosamine structure at the reducing end of their chain.

Parnaparin sodium complies with the monograph on *Low-molecular-mass heparins* (0828), with the modifications and additional requirements below.

The mass-average molecular mass ranges between 4000 and 6000 with a characteristic value of about 5000.

The degree of sulphatation is 2.0 to 2.6 per disaccharide unit.

The potency is not less than 75 IU and not more than 110 IU of anti-factor Xa activity per milligram calculated with reference to the dried substance. The ratio of anti-factor Xa activity to anti-factor IIa activity is between 1.5 and 3.0.

IDENTIFICATION

Carry out identification test C as described in the monograph on *Low-molecular-mass heparins* (0828). In order to verify the suitability of the system in the lower molecular mass ranges (for example M_r 2000), a suitable reference preparation is used. The following requirements apply.

The mass-average molecular mass ranges between 4000 and 6000. The mass percentage of chains lower than 3000 is not more than 30 per cent. The mass percentage of chains between 3000 and 8000 ranges between 50 per cent and 60 per cent.

TESTS

Appearance of solution. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₅ (2.2.2, Method II).

Dissolve 1.5 g in 10 ml of *water R*.

Copper: maximum 10 ppm, determined by atomic absorption spectrometry (2.2.23, Method I) and calculated with reference to the dried substance.

01/2005:2018

PAROXETINE HYDROCHLORIDE
HEMIHYDRATE

Paroxetini hydrochloridum hemihydricum

C₁₉H₂₁ClFNO₃ · 1/2 H₂O M_r 374.8

DEFINITION

(3*S*,4*R*)-3-[(1,3-Benzodioxol-5-yloxy)methyl]-4-(4-fluorophenyl)piperidine hydrochloride hemihydrate.

Content: 97.5 per cent to 102.0 per cent (anhydrous substance).

PRODUCTION

Impurity G: not more than 1 ppm, determined by liquid chromatography, coupled with tandem mass spectrometry using a suitable, validated method.

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: slightly soluble in water, freely soluble in methanol, sparingly soluble in alcohol and in methylene chloride.

It shows pseudopolymorphism.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: *paroxetine hydrochloride hemihydrate CRS*.

If the spectra obtained show differences, dissolve 1 part of the substance to be examined and 1 part of the reference substance separately in 10 parts of a mixture of 1 volume of *water R* and 9 volumes of *2-propanol R*, heat to 70 °C to dissolve. Recrystallise and record new spectra using the residues.

B. Examine the chromatograms obtained in the test for impurity D.

Injection: test solution and reference solution (c).

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (c).

C. It complies with the test for water (see Tests).

D. It gives reaction (b) of chlorides (2.3.1).

TESTS

Impurity D. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.1000 g of the substance to be examined in 20 ml of *methanol R* and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of *paroxetine impurity D CRS* and 5 mg of *paroxetine hydrochloride hemihydrate CRS* in 2 ml of *methanol R* and dilute to 100.0 ml with the mobile phase.

Reference solution (c). Dissolve 10 mg of *paroxetine hydrochloride hemihydrate CRS* in 2 ml of *methanol R* and dilute to 10.0 ml with the mobile phase.

Column:

- size: $l = 0.10$ m, $\varnothing = 4.0$ mm,
- stationary phase: *silica gel AGP for chiral chromatography R* (5 μ m).

Mobile phase: mix 2 volumes of *methanol R* and 8 volumes of a 5.8 g/l solution of *sodium chloride R*.

Flow rate: 0.5 ml/min.

Detection: spectrophotometer at 295 nm.

Injection: 10 μ l; inject the test solution and reference solutions (a) and (b).

Run time: 2.5 times the retention time of paroxetine.

Retention time: paroxetine = about 30 min.

System suitability: reference solution (b):

- resolution: minimum 2.2 between the peaks due to impurity D and paroxetine.

Limit:

- **impurity D:** not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent).

Related substances. Liquid chromatography (2.2.29).

Solvent mixture. Mix 1 volume of *tetrahydrofuran R* and 9 volumes of *water R*.

Test solution. Dissolve 50.0 mg of the substance to be examined in the solvent mixture and dilute to 50.0 ml with the same solvent mixture.

Reference solution (a). Dilute 5.0 ml of the test solution to 50.0 ml with the solvent mixture.

Reference solution (b). Dissolve 2 mg of *paroxetine impurity C CRS* in the solvent mixture and dilute to 20.0 ml with the same solvent mixture.

Reference solution (c). To 2.0 ml of reference solution (a) add 2.0 ml of reference solution (b) and dilute to 20.0 ml with the solvent mixture.

Reference solution (d). Dilute 2.0 ml of reference solution (a) to 200.0 ml with the solvent mixture.

Reference solution (e). Dissolve 2 mg of *paroxetine impurity A CRS* in the solvent mixture and dilute to 20 ml with the same solvent mixture.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: end-capped octylsilyl silica gel for chromatography *R* (5 μ m),
- temperature: 40 °C.

Mobile phase:

- mobile phase A: trifluoroacetic acid *R*, tetrahydrofuran *R*, water *R* (5:100:900 V/V/V),
- mobile phase B: trifluoroacetic acid *R*, tetrahydrofuran *R*, acetonitrile *R* (5:100:900 V/V/V),

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 30	80	20
30 - 50	80 → 20	20 → 80
50 - 60	20	80
60 - 65	20 → 80	80 → 20
65 - 70	80	20

Flow rate: 1 ml/min.

Detection: spectrophotometer at 295 nm.

Injection: 20 μ l; inject the test solution and reference solutions (c), (d) and (e).

Relative retention with reference to paroxetine: impurity A = about 0.8.

System suitability: reference solution (c):

- resolution: minimum 3.5 between the peaks due to impurity C and paroxetine.

Limits:

- **impurity A:** not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (d) (0.3 per cent),
- **any other impurity:** not more than the area of the principal peak in the chromatogram obtained with reference solution (d) (0.1 per cent),
- **total:** not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (d) (0.5 per cent),
- **disregard limit:** 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (d) (0.05 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test C. Use a platinum crucible. Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) *R*.

Water (2.5.12): 2.2 per cent to 2.7 per cent, determined on 0.300 g.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in *water R* and dilute to 100.0 ml with the same solvent.

Reference solution (a). Dissolve 50.0 mg of *paroxetine hydrochloride hemihydrate CRS* in *water R* and dilute to 100.0 ml with the same solvent.

Reference solution (b). Dissolve 5.0 mg of *paroxetine hydrochloride hemihydrate CRS* and 5 mg of *paroxetine impurity A CRS* in *water R* and dilute to 10.0 ml with the same solvent.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: trimethylsilyl silica gel for chromatography *R* (5 μ m).

Mobile phase: dissolve 3.85 g of ammonium acetate *R* in *water R*, adjust to pH 5.5 with *anhydrous acetic acid R* and dilute to 600 ml with the same solvent; add 400 ml of *acetonitrile R*; slowly add with stirring, 10 ml of *triethylamine R* and readjust to pH 5.5 with *anhydrous acetic acid R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 295 nm.

Injection: 10 μ l.

Run time: twice the retention time of paroxetine.

System suitability: reference solution (b):

- resolution: minimum 2 between the peaks due to paroxetine and impurity A.

Calculate the percentage content of paroxetine hydrochloride using the chromatogram obtained with reference solution (a).

STORAGE

Protected from light.

IMPURITIES

A. R = H: (3*S*,4*R*)-3-[(1,3-benzodioxol-5-yloxy)methyl]-4-phenylpiperidine (desfluoroparoxetine),

B. R = OCH₃: (3*S*,4*R*)-3-[(1,3-benzodioxol-5-yloxy)methyl]-4-(4-methoxyphenyl)piperidine,

C. R = OC₂H₅: (3*S*,4*R*)-3-[(1,3-benzodioxol-5-yloxy)methyl]-4-(4-ethoxyphenyl)piperidine,

D. (3*R*,4*S*)-3-[(1,3-benzodioxol-5-yloxy)methyl]-4-(4-fluorophenyl)piperidine ((+)-*trans*-paroxetine),

E. (3*RS*,4*RS*)-3-[(1,3-benzodioxol-5-yloxy)methyl]-4-(4-fluorophenyl)piperidine (*cis*-paroxetine),

F. 3,3'-[methylenebis(1,3-benzodioxole-6,4-diylloxymethylene)]bis[4-(4-fluorophenyl)piperidine],

G. 4-(4-fluorophenyl)-1-methyl-1,2,3,6-tetrahydropyridine.

01/2005:1459

PASSION FLOWER

Passiflorae herba

DEFINITION

Passion flower consists of the fragmented or cut, dried aerial parts of *Passiflora incarnata* L. It may also contain flowers and/or fruits. It contains not less than 1.5 per cent of total flavonoids expressed as vitexin (C₂₁H₂₀O₁₀; *M_r* 432.4), calculated with reference to the dried drug.

CHARACTERS

It has the macroscopic and microscopic characters described under Identification tests A and B.

IDENTIFICATION

A. The green to greenish-grey or brownish stem is ligneous, hollow, longitudinally striated, glabrous or very slightly pubescent, with a diameter that is generally less than

8 mm. The green or greenish-brown leaves are alternate, finely dentate and pubescent, deeply divided into three acute lobes of which the central lobe is the largest. The midrib is much more prominent on the lower surface. The petiole is pubescent and bears two dark-coloured nectaries near the lamina. The tendrils are very numerous and grow from the axils of the leaves; they are fine, smooth, round and terminated in cylindrical spirals. The radiate flowers, if present, have three small bracts and a corolla consisting of five white, elongated petals with several rows of filiform, petaloid appendices. If present, the greenish to brownish fruit is flattened and oval; it contains several flattened, brownish-yellow, pitted seeds.

B. Reduce to a powder (355). The powder is light green. Examine under a microscope using *chloral hydrate solution R*. The powder shows fragments of the leaf epidermis with sinuous walls and anomocytic stomata (2.8.3); numerous cluster crystals of calcium oxalate isolated or aligned along the veins; many isolated or grouped fibres from the stems associated with pitted vessels and tracheids; uniseriate trichomes with one to three thin-walled cells, straight or slightly curved, ending in a point or sometimes a hook. In addition the powder shows, if flowers are present, papillose epidermises of the petals and appendages and pollen grains with a reticulate exine; and if mature fruits are present, scattered brown tannin cells and brownish-yellow, pitted fragments of the testa.

C. Examine the chromatograms obtained in the test for other species of *Passiflora*.

The chromatogram obtained with the test solution shows below the zone due to rutin in the chromatogram obtained with the reference solution a zone of intense yellow fluorescence, above it a zone of green fluorescence (diglycosylflavone), below the zone due to hyperoside in the chromatogram obtained with the reference solution a zone of yellow fluorescence (iso-orientin) and above a zone of green fluorescence (isovitexin), above the zone due to hyperoside in the chromatogram obtained with the reference solution a zone of brownish-yellow fluorescence (orientin) and above it a zone of green fluorescence (vitexin). These latter two zones may be absent. Further zones may be present.

TESTS

Foreign matter (2.8.2). It complies with the test for foreign matter.

Other species of *Passiflora*. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution. To 1.0 g of the powdered drug (355) add 5 ml of *methanol R*. Heat to boiling under a reflux condenser for 10 min. Cool and filter.

Reference solution. Dissolve with heating 2.0 mg of *rutin R* and 2.0 mg of *hyperoside R* in 10 ml of *methanol R*.

Apply separately to the plate as bands 10 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *anhydrous formic acid R*, 10 volumes of *water R*, 30 volumes of *methyl ethyl ketone R* and 50 volumes of *ethyl acetate R*. Allow the plate to dry in air. Spray with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Allow the plate to dry in air for 30 min. Examine the plate in ultraviolet light at 365 nm. The chromatogram obtained with the reference solution shows in the lower third a zone of yellowish-brown fluorescence due to rutin and in the middle third a zone of yellowish-brown fluorescence due to hyperoside.

The chromatogram obtained with the test solution shows no intense zones of greenish-yellow or orange-yellow fluorescence between the zone due to diglycosylflavones and that due to iso-orientin (*P. coerulea* and *P. edulis*).

Total ash (2.4.16). Not more than 13.0 per cent.

Loss on drying (2.2.32). Not more than 10.0 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100 °C to 105 °C for 2 h.

ASSAY

Stock solution. In a 100 ml round-bottomed flask, introduce 0.200 g of the powdered drug (250) and add 40 ml of *alcohol* (60 per cent V/V) *R*. Heat in a water-bath at 60 °C under a reflux condenser for 30 min while shaking frequently. Allow to cool and filter the mixture through a plug of absorbent cotton in a 100 ml flask. Transfer the absorbent cotton with the drug residue into the round-bottomed flask. Add 40 ml of *alcohol* (60 per cent V/V) *R* and heat again in a water-bath at 60 °C under reflux for 10 min. Allow to cool and filter the mixture and the first filtrate from the 100 ml flask through a paper filter in the 100 ml volumetric flask. Dilute to 100 ml with the same solvent, while rinsing the flask, round-bottomed flask and filter.

Test solution. Introduce 5.0 ml of stock solution into a flask. Evaporate to dryness under reduced pressure and take up the residue with 10 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R*. Add 10 ml of a solution consisting of 25 g/l of *boric acid R* and 20 g/l of oxalic acid in *anhydrous formic acid R* and dilute to 25.0 ml with *anhydrous acetic acid R*.

Compensation solution. Into a second flask introduce 5.0 ml of the stock solution. Evaporate to dryness under reduced pressure and take up the residue with 10 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R*. Add 10 ml of *anhydrous formic acid R* and dilute to 25.0 ml with *anhydrous acetic acid R*.

Measure the absorbance (2.2.25) of the test solution after 30 min by comparison with the compensation solution at 401 nm.

Calculate the percentage content of total flavonoids, expressed as vitexin, from the expression:

$$\frac{A \times 0.8}{m}$$

taking the value of the specific absorbance to be 628.

A = absorbance of the test solution at 401 nm,

m = mass of the substance to be examined, in grams.

STORAGE

Store protected from light.

PEFLOXACIN MESILATE DIHYDRATE

Pefloxacin mesilas dihydricus

$C_{18}H_{24}FN_3O_6S \cdot 2H_2O$

M_r 465.5

DEFINITION

Pefloxacin mesilate dihydrate contains not less than 98.5 per cent and not more than the equivalent of 101.5 per cent of 1-ethyl-6-fluoro-7-(4-methylpiperazin-1-yl)-4-oxo-1,4-dihydroquinoline-3-carboxylic acid methanesulphonate, calculated with reference to the anhydrous substance.

PRODUCTION

The production method must be evaluated to determine the potential for formation of alkyl mesilates, which is particularly likely to occur if the reaction medium contains lower alcohols. Where necessary, the production method is validated to demonstrate that alkyl mesilates are not detectable in the final product.

CHARACTERS

A fine, white or almost white powder, freely soluble in water, slightly soluble in alcohol, very slightly soluble in methylene chloride.

IDENTIFICATION

- A. Dissolve separately 0.1 g of the substance to be examined and 0.1 g of *pefloxacin mesilate dihydrate CRS* in 10 ml of *water R*. Add 5 ml of 1 *M sodium hydroxide*. Adjust the pH of the solution to 7.4 ± 0.1 with *phosphoric acid R* and shake with 2 quantities, each of 30 ml, of *methylene chloride R*. Combine the organic layers and dry over *anhydrous sodium sulphate R*. Evaporate to dryness. Examine the residues by infrared absorption spectrophotometry (2.2.24), comparing the spectra obtained. Examine the residues as discs prepared using *potassium bromide R*.
- B. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution. Dissolve 40 mg in *water R* and dilute to 1 ml with the same solvent.

Reference solution. Dissolve 60 mg of *methanesulphonic acid R* in *water R* and dilute to 10 ml with the same solvent.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 5 volumes of *water R*, 10 volumes of *ammonia R*, 20 volumes of *butanol R* and 65 volumes of *acetone R*. Allow the plate to dry in air. Spray with a 0.4 g/l solution of *bromocresol purple R* in *alcohol* (50 per cent V/V) *R*, adjusted to pH 10 using 1 *M sodium hydroxide*. The spot in the chromatogram obtained with the test solution is similar in position, colour and size to the spot in the chromatogram obtained with the reference solution.

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 10.0 ml with the same solvent.

Appearance of solution. Examined within 1 h after its preparation, solution S is not more opalescent than reference suspension II (2.2.1) and not more intensely coloured than intensity 3 of the range of reference solutions of the most appropriate colour (2.2.2, *Method II*).

pH (2.2.3). Dilute 1 ml of solution S to 10 ml with *carbon dioxide-free water R*. The pH of the solution is 3.5 to 4.5.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 5.0 mg of *pefloxacin impurity B CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase. In 2.0 ml of the solution obtained, dissolve the contents of a vial of *pefloxacin impurity C CRS*.

Reference solution (b). Dissolve 10.0 mg of *norfloxacin impurity A CRS* (pefloxacin impurity F) in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 6 mm in internal diameter packed with *octadecylsilyl vinyl polymer for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture prepared as follows: 30 volumes of *acetonitrile R*, 70 volumes of a solution containing 2.70 g/l of *cetyltrimethylammonium bromide R* and 6.18 g/l of *boric acid R* (exactly adjusted to pH 8.30 with 1 M *sodium hydroxide*), and 0.2 volumes of *thiodiethylene glycol R*,
- as detector a spectrophotometer set at 258 nm and 273 nm.

Inject 20 µl of reference solution (a). Record the chromatogram at 273 nm. The test is not valid unless the resolution between the peaks corresponding to impurity B and impurity C is at least 1.5. Inject 20 µl of the test solution and 20 µl of reference solution (b). Record the chromatograms of the test solution at 258 nm and 273 nm for 4 times the retention time of pefloxacin (about 60 min). Record the chromatogram of reference solution (b) at 258 nm. When the chromatograms are recorded in the prescribed conditions, the relative retentions are indicated in the following table.

	Approximate relative retention	Correction factor
Impurity E	0.2	–
Impurity D	0.3	–
Impurity A	0.5	–
Impurity G	0.8	1.4
Pefloxacin	1	–
Impurity C	1.7	2.4
Impurity B	1.8	–
Impurity H	2.4	1.8
Impurity F	3.5	–

From the chromatogram obtained at 258 nm with the test solution, calculate the percentage content of impurity C, F, G and H using the area of the principal peak in the chromatogram obtained at 258 nm with reference solution (b) (external standardisation) taking into account the correction factors indicated in the table.

From the chromatogram obtained at 273 nm with the test solution, calculate the percentage content of impurity A, B, D and E and of any unknown impurity from the areas of the peaks in the chromatogram obtained with the test solution by the normalisation procedure, disregarding the peaks with an area less than 0.0005 times that of the principal peak in the chromatogram obtained at 273 nm with the test solution.

None of the impurities has a content of more than 0.5 per cent and not more than 3 impurities have a content between 0.2 per cent and 0.5 per cent. The sum of the contents of the impurities is not more than 1.0 per cent.

Heavy metals (2.4.8). 1.0 g complies with limit test E for heavy metals (10 ppm). Prepare the standard using 10.0 ml of *lead standard solution (1 ppm Pb) R*.

Water (2.5.12): 7.0 per cent to 8.5 per cent, determined on 50.0 mg by the semi-micro determination of water using a mixture of 10 volumes of *methanol R* and 50 volumes of *methylene chloride R*.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 15.0 ml of *anhydrous acetic acid R* and add 75.0 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 21.48 mg of C₁₈H₂₄FN₃O₆S.

STORAGE

Store in an airtight container, protected from light.

IMPURITIES

A. R1 = CO₂H, R2 = F, R3 = H: 1-ethyl-6-fluoro-4-oxo-7-(piperazin-1-yl)-1,4-dihydroquinoline-3-carboxylic acid (demethylated pefloxacin or norfloxacin),

B. R1 = CO₂H, R2 = Cl, R3 = CH₃: 6-chloro-1-ethyl-7-(4-methylpiperazin-1-yl)-4-oxo-1,4-dihydroquinoline-3-carboxylic acid (chlorinated homologue of pefloxacin),

E. R1 = H, R2 = F, R3 = CH₃: 1-ethyl-6-fluoro-7-(4-methylpiperazin-1-yl)quinoline-4(1H)-one (decarboxylated pefloxacin),

C. 1-ethyl-6-fluoro-5-(4-methylpiperazin-1-yl)-4-oxo-1,4-dihydroquinoline-3-carboxylic acid (isopefloxacin),

D. 4-(3-carboxy-1-ethyl-6-fluoro-4-oxo-1,4-dihydroquinolin-7-yl)-1-methylpiperazine 1-oxide (*N*-oxide of pefloxacin),

- F. R₁ = R₂ = H, R₃ = Cl: 7-chloro-1-ethyl-6-fluoro-4-oxo-1,4-dihydroquinoline-3-carboxylic acid (*N*-ethyl acid) (norfloxacin impurity A),
- G. R₁ = C₂H₅, R₂ = H, R₃ = Cl: ethyl 7-chloro-1-ethyl-6-fluoro-4-oxo-1,4-dihydroquinoline-3-carboxylate (*N*-ethyl ester),
- H. R₁ = R₃ = H, R₂ = Cl: 5-chloro-1-ethyl-6-fluoro-4-oxo-1,4-dihydroquinoline-3-carboxylic acid (iso-*N*-ethyl acid).

01/2005:1461

PENBUTOLOL SULPHATE

Penbutololi sulfas

C₃₆H₆₀N₂O₈SM_r 681

DEFINITION

Penbutolol sulphate contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of di[(2*S*)-1-(2-cyclopentylphenoxy)-3-[(1,1-dimethylethyl)amino]propan-2-ol] sulphate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, slightly soluble in water, soluble in methanol, practically insoluble in cyclohexane.

IDENTIFICATION

First identification: A, C, D.

Second identification: B, C, D.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *penbutolol sulphate CRS*.
- B. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*.
Test solution. Dissolve 40 mg of the substance to be examined in 1 ml of *methanol R*.
Reference solution. Dissolve 40 mg of *penbutolol sulphate CRS* in 1 ml of *methanol R*.
 Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *glacial acetic acid R*, 20 volumes of *water R*, 35 volumes of *butanol R* and 35 volumes of *ethyl acetate R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.
- C. Dissolve 50 mg in a mixture of 5 ml of *water R* and 1 ml of 0.1 M *hydrochloric acid*. The solution gives reaction (a) of sulphates (2.3.1).

D. It complies with the test for specific optical rotation (see Tests).

TESTS

Solution S. Dissolve 1.00 g in *methanol R* and dilute to 20.0 ml with the same solvent.

Acidity or alkalinity. To 4 ml of solution S add 4 ml of *carbon dioxide-free water R*. Add 0.1 ml of *methyl red solution R* and 0.2 ml of 0.01 M *sodium hydroxide*. The solution is yellow. Add 0.4 ml of 0.01 M *hydrochloric acid*. The solution is red.

Specific optical rotation (2.2.7): −23 to −25 determined on solution S, calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 40.0 mg of the substance to be examined in a mixture of 40 volumes of mobile phase B and 60 volumes of mobile phase A and dilute to 10.0 ml with the same mixture of solvents.

Reference solution (a). Dissolve 4.0 mg of the substance to be examined and 1.0 mg of *penbutolol impurity A CRS* in 5.0 ml of a mixture of 40 volumes of mobile phase B and 60 volumes of mobile phase A.

Reference solution (b). Dilute 1.0 ml of the test solution to 200.0 ml with a mixture of 40 volumes of mobile phase B and 60 volumes of mobile phase A.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 10.0 ml with a mixture of 40 volumes of mobile phase B and 60 volumes of mobile phase A.

Reference solution (d). Dissolve 5.0 mg of *penbutolol impurity A CRS* in a mixture of 40 volumes of mobile phase B and 60 volumes of mobile phase A and dilute to 50.0 ml with the same mixture of solvents. Dilute 2.0 ml to 10.0 ml with the same mixture of solvents.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter, packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.0 ml/min:
Mobile phase A. Mix 39 volumes of *acetonitrile for chromatography R* and 61 volumes of *methanol R*,
Mobile phase B. Dissolve 11 g of *sodium heptanesulphonate R* in 1000 ml of *water R*, add 5.0 ml of *triethylamine R* and adjust to pH 2.7 with *phosphoric acid R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 15	60	40	isocratic
15 - 35	60 → 80	40 → 20	linear gradient
35 - 36	80 → 60	20 → 40	linear gradient

— as detector a spectrophotometer set at 270 nm.

Inject 10 µl of reference solution (b) and adjust the sensitivity of the system so that the height of the second peak (penbutolol) is at least 20 per cent of the full scale of the recorder. The resolution between the 2 principal peaks must be at least 3.0.

Inject 10 µl of each of the other solutions. In the chromatogram obtained with the test solution, the area of any peak corresponding to impurity A is not greater than the area of the principal peak in the chromatogram obtained with reference solution (d) (0.5 per cent), the area of any peak, apart from the principal peak and that of impurity A, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per

cent) and the sum of the areas of all the peaks, apart from the principal peak and the peak corresponding to impurity A, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent). Disregard any peak with an area less than that of the principal peak in the chromatogram obtained with reference solution (c).

Heavy metals (2.4.8). 1.0 g complies with limit test F for heavy metals (10 ppm). Prepare the reference solution using 1 ml of *lead standard solution* (10 ppm Pb) R.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.500 g in 40 ml of *anhydrous acetic acid* R. Titrate with 0.1 M *perchloric acid* determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 68.10 mg of C₃₆H₆₀N₂O₈S.

STORAGE

Store protected from light.

IMPURITIES

Specified impurities: A.

A. (2S)-1-[2-(cyclopent-1-enyl)phenoxy]-3-[(1,1-dimethylethyl)amino]propan-2-ol.

01/2005:0566

PENICILLAMINE

Penicillaminum

C₅H₁₁NO₂S

M_r 149.2

DEFINITION

Penicillamine contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of (2S)-2-amino-3-methyl-3-sulphanylbutoanoic acid, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, freely soluble in water, slightly soluble in alcohol.

IDENTIFICATION

First identification: A, B, D.

Second identification: A, C, D.

A. Dissolve 0.5 g in a mixture of 0.5 ml of *hydrochloric acid* R and 4 ml of warm *acetone* R, cool in iced water and initiate crystallisation by scratching the wall of the tube with a glass rod. A white precipitate is formed.

Filter with the aid of vacuum, wash with *acetone* R and dry with suction. A 10 g/l solution of the precipitate is dextrorotatory.

B. Examine the chromatograms obtained in the test for penicillamine disulphide. The principal peak in the chromatogram obtained with the test solution is similar in position and approximate size to the principal peak in the chromatogram obtained with reference solution (a).

C. Examine by thin-layer chromatography (2.2.27), using *silica gel G* R as the coating substance.

Test solution. Dissolve 10 mg of the substance to be examined in 4 ml of *water* R.

Reference solution. Dissolve 10 mg of *penicillamine CRS* in 4 ml of *water* R.

Apply separately to the plate 2 µl of each solution.

Develop over a path of 10 cm using a mixture of 18 volumes of *glacial acetic acid* R, 18 volumes of *water* R and 72 volumes of *butanol* R. Dry the plate at 100 °C to 105 °C for 5 min to 10 min and expose to iodine vapour for 5 min to 10 min. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

D. Dissolve 40 mg in 4 ml of *water* R and add 2 ml of *phosphotungstic acid solution* R. Allow to stand for 5 min. A blue colour develops.

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water* R and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than intensity 6 of the range of reference solutions of the most appropriate colour (2.2.2, *Method II*).

pH (2.2.3). Dilute 1 ml of solution S to 10 ml with *carbon dioxide-free water* R. The pH of this solution is 4.5 to 5.5.

Specific optical rotation (2.2.7). Dissolve 0.500 g in 1 M *sodium hydroxide* and dilute to 10.0 ml with the same solvent. The specific optical rotation is –61.0 to –65.0, calculated with reference to the dried substance.

Penicillamine disulphide. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 40 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 40 mg of *penicillamine CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 20 mg of *penicillamine disulphide CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 5 mm in internal diameter packed with *octylsilyl silica gel for chromatography* R (10 µm),
- as mobile phase at a flow rate of 2.0 ml/min a solution containing 0.1 g/l of *sodium edetate* R and 2 g/l of *methanesulphonic acid* R,
- as detector a spectrophotometer set at 220 nm.

In the chromatogram obtained with the test solution the area of any peak due to penicillamine disulphide is not greater than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (1 per cent).

Ultraviolet-absorbing substances. Dissolve 0.100 g in *water R* and dilute to 50.0 ml with the same solvent. The absorbance (2.2.25) of the solution at 268 nm is not greater than 0.07 (about 0.5 per cent of penilloic acid).

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution* (2 ppm Pb) *R*.

Mercury. Not more than 10 ppm of Hg, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. To 1.00 g of the substance to be examined add 10 ml of *water R* and 0.15 ml of *perchloric acid R* and swirl until dissolution is complete. Add 1.0 ml of a 10 g/l solution of *ammonium pyrrolidinedithiocarbamate R* which has been washed immediately before use three times, each time with an equal volume of *methyl isobutyl ketone R*. Mix and add 2.0 ml of *methyl isobutyl ketone R* and shake for 1 min. Dilute to 25.0 ml with *water R* and allow the layers to separate; use the methyl isobutyl ketone layer.

Reference solutions. Dissolve a quantity of *mercuric oxide R* equivalent to 0.108 g of HgO in the smallest necessary volume of *dilute hydrochloric acid R* and dilute to 1000.0 ml with *water R* (100 ppm Hg). Prepare the reference solutions in the same manner as the test solution but using instead of the substance to be examined suitable volumes of the solution containing 100 ppm of Hg.

Measure the absorbance at 254 nm using a mercury hollow-cathode lamp as source of radiation and an air-acetylene flame. Set the zero of the instrument using a methyl isobutyl ketone layer obtained as described for the test solution but omitting the substance to be examined.

Penicillin. Carry out all the operations in a penicillin-free atmosphere and with equipment reserved for this test. Sterilise the equipment at 180 °C for 3 h and the buffer solutions at 121 °C for 20 min before use.

Test solution (a). Dissolve 1.000 g of the substance to be examined in 8 ml of *buffer solution pH 2.5 R* and add 8 ml of *ether R*. Shake vigorously for 1 min. Repeat the extraction and combine the ether layers. Add 8 ml of *buffer solution pH 2.5 R*. Shake for 1 min, allow to settle and quantitatively separate the upper layer, taking care to eliminate the aqueous phase completely (*penicillin is unstable at pH 2.5; carry out operations at this pH within 6 min to 7 min*). Add 8 ml of *phosphate buffer solution pH 6.0 R2*; shake for 5 min, allow to settle, separate the aqueous layer and check that the pH is 6.0.

Test solution (b). To 2 ml of test solution (a) add 20 µl of *penicillinase solution R* and incubate at 37 °C for 1 h.

Reference solution (a). Dissolve 5 mg of *benzylpenicillin sodium R* in 500 ml of *phosphate buffer solution pH 6.0 R2*. Dilute 0.25 ml of this solution to 200.0 ml with *buffer solution pH 2.5 R*. Carry out the extraction using 8 ml of this solution as described for test solution (a).

Reference solution (b). To 2 ml of reference solution (a), add 20 µl of *penicillinase solution R* and incubate at 37 °C for 1 h.

Reference solution (c). Prepare the solution as described for test solution (a) but omitting the substance to be examined (blank).

Liquefy a suitable nutrient medium such as that described below and inoculate it at a suitable temperature with a culture of *Micrococcus flavus* (ATCC 9341) to give 5×10^4

micro-organisms per millilitre or a different quantity if necessary to obtain the required sensitivity and formation of clearly defined inhibition zones of suitable diameter. Immediately pour the inoculated medium into five Petri dishes 10 cm in diameter to give uniform layers 2 mm to 5 mm deep. The medium may alternatively consist of two layers, only the upper layer being inoculated. Store the dishes so that no appreciable growth or death of the micro-organisms occurs before use and so that the surface of the medium is dry at the time of use. In each dish, place five stainless steel hollow cylinders 6 mm in diameter on the surface of the agar evenly spaced on a circle with a radius of about 25 mm and concentric with the dish. For each dish, place in separate cylinders 0.15 ml of test solutions (a) and (b) and reference solutions (a), (b) and (c). Maintain at 30 °C for at least 24 h. Measure the diameters of the inhibition zones to at least 0.1 mm. The test is valid if reference solution (a) gives a clear inhibition zone and if reference solutions (b) and (c) give no inhibition zone. If test solution (a) gives an inhibition zone, this is caused by penicillin if test solution (b) gives no inhibition zone. If this is so, the average diameter of the inhibition zones given by test solution (a) for the five Petri dishes is less than the average diameter of the inhibition zones given by reference solution (a) (0.1 ppm).

Nutrient medium (pH 6.0)

Peptone	5 g
Yeast extract	1.5 g
Meat extract	1.5 g
Sodium chloride	3.5 g
Agar	15 g
<i>Distilled water R</i>	1000 ml

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying over *diphosphorus pentoxide R* at 60 °C at a pressure not exceeding 670 Pa.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.1000 g in 30 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 14.92 mg of $C_5H_{11}NO_2S$.

IMPURITIES

A. 3,3'-(disulphanediyl)bis[(2S)-2-amino-3-methylbutanoic] acid (penicillamine disulphide),

B. penicillin.

01/2005:1355

PENTAERYTHRITYL TETRANITRATE, DILUTED

Pentaerythrityli tetranitras dilutus

 $C_5H_8N_4O_{12}$ M_r 316.1

DEFINITION

Diluted pentaerythrityl tetranitrate is a dry mixture of pentaerythrityl tetranitrate and *Lactose monohydrate* (0187) or *Mannitol* (0559). It contains not less than 95.0 per cent *m/m* and not more than 105.0 per cent *m/m* of the declared content of 2,2-bis(hydroxymethyl)propane-1,3-diol tetranitrate.

CHARACTERS

Undiluted pentaerythrityl tetranitrate is a white or slightly yellowish powder, practically insoluble in water, soluble in acetone, slightly soluble in alcohol.

The solubility of the diluted product depends on the diluent and its concentration.

IDENTIFICATION

First identification: A, B, D.

Second identification: A, C, D.

- The melting point (2.2.14) of the residue obtained with the substance to be examined in identification test B is 138 °C to 142 °C.
- Shake a quantity of the substance to be examined and a quantity of *diluted pentaerythrityl tetranitrate CRS*, each corresponding to 25 mg of pentaerythrityl tetranitrate with 10 ml of *acetone R* for 5 min. Filter, evaporate to dryness at a temperature below 40 °C and dry the residue over *diphosphorus pentoxide R* at a pressure of 0.7 kPa for 16 h. Examine the residue obtained with the substance to be examined by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum of the residue obtained with *diluted pentaerythrityl tetranitrate CRS*. Examine the residues prepared as discs.
- Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel G plate R*.

Test solution. Shake a quantity of the substance to be examined corresponding to 10 mg of pentaerythrityl tetranitrate with 10 ml of *alcohol R* for 5 min and filter.

Reference solution. Shake a quantity of *diluted pentaerythrityl tetranitrate CRS* corresponding to 10 mg of pentaerythrityl tetranitrate with 10 ml of *alcohol R* for 5 min and filter.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of *ethyl acetate R* and 80 volumes of *toluene R*. Dry the plate in a current of air. Spray with freshly prepared *potassium iodide and starch solution R*. Expose to ultraviolet light at 254 nm for 15 min. Examine in daylight. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

- Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel G plate R*.

Test solution. Shake a quantity of the substance to be examined corresponding to 0.10 g of lactose or mannitol with 10 ml of *water R*. Filter if necessary.

Reference solution (a) Dissolve 0.10 g of *lactose R* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 0.10 g of *mannitol R* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (c). Mix equal volumes of reference solutions (a) and (b).

Apply separately to the plate 1 µl of each solution and thoroughly dry the starting points. Develop over a path of 15 cm using a mixture of 10 volumes of *water R*, 15 volumes of *methanol R*, 25 volumes of *anhydrous acetic acid R* and 50 volumes of *ethylene chloride R*, measured accurately since a slight excess of water produces cloudiness. Dry the plate in a current of warm air. Repeat immediately the development after renewing the mobile phase. Dry the plate in a current of warm air. Spray with *4-aminobenzoic acid solution R*. Dry the plate in a current of cold air until the acetone is removed. Heat the plate at 100 °C for 15 min. Allow to cool and spray with a 2 g/l solution of *sodium periodate R*. Dry the plate in a current of cold air. Heat the plate at 100 °C for 15 min. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a) for lactose or to the principal spot in the chromatogram obtained with reference solution (b) for mannitol. The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

TESTS

Inorganic nitrates. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution. Shake a quantity of the substance to be examined corresponding to 0.10 g of pentaerythrityl tetranitrate with 5 ml of *alcohol R* and filter.

Reference solution. Dissolve 10 mg of *potassium nitrate R* in 1 ml of *water R* and dilute to 100 ml with *alcohol R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 15 volumes of *glacial acetic acid R*, 30 volumes of *acetone R* and 60 volumes of *toluene R*. Dry the plate thoroughly in a current of air until the acetic acid is completely removed. Spray copiously with freshly prepared *potassium iodide and starch solution R*. Expose the plate to ultraviolet light at 254 nm for 15 min. Examine in daylight. Any spot corresponding to nitrate ion in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent, calculated as potassium nitrate).

Related substances. Examine by liquid chromatography (2.2.29) as described under Assay.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with reference solution (c) is at least 20 per cent of the full scale of the recorder.

The test is not valid unless in the chromatogram obtained with reference solution (e), the resolution between the peaks corresponding to glyceryl trinitrate and to pentaerythrityl tetranitrate is at least 2.0.

Inject 20 µl of test solution (a) and 20 µl of reference solution (c) and record the chromatogram of test solution (a) for at least five times the retention time of pentaerythrityl tetranitrate. In the chromatogram obtained with test solution (a); the area of any peak, apart from the principal

peak is not greater than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.3 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (0.6 per cent). Disregard any peak with an area less than 0.2 times that of the principal peak in the chromatogram obtained with reference solution (c).

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution (a). Sonicate for 15 min a quantity of the substance to be examined corresponding to 25.0 mg of pentaerythrityl tetranitrate in 20 ml of *methanol R* and dilute to 25.0 ml with the mobile phase. Filter through a suitable membrane filter.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with the mobile phase.

Reference solution (a). Sonicate for 15 min a quantity of *diluted pentaerythrityl tetranitrate CRS* corresponding to 25.0 mg of pentaerythrityl tetranitrate in 20 ml of *methanol R* and dilute to 25.0 ml with the mobile phase. Filter through a suitable membrane filter.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the mobile phase.

Reference solution (c). Dilute 0.3 ml of reference solution (b) to 10.0 ml with the mobile phase.

Reference solution (d). Sonicate for 15 min a quantity of *glyceryl trinitrate solution CRS* corresponding to 20.0 mg of glyceryl trinitrate in 20 ml of *methanol R* and dilute to 25.0 ml with the mobile phase. Filter through a suitable membrane filter. Dilute 1.0 ml of the filtrate to 10.0 ml with the mobile phase.

Reference solution (e). To 1 ml of reference solution (b), add 1 ml of reference solution (d) and dilute to 10 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (10 µm),
- as mobile phase at a flow rate of 2 ml/min a mixture of 40 volumes of *water R* and 60 volumes of *methanol R*,
- as detector a spectrophotometer set at 230 nm.

When the chromatograms are recorded in the prescribed conditions the retention time of pentaerythrityl tetranitrate is about 8 min. Inject 20 µl of reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained is at least 50 per cent of the full scale of the recorder. Inject reference solution (b) six times. The assay is not valid unless the relative standard deviation for the area of the principal peak is at most 2.0 per cent. Inject test solution (b) and reference solution (b) alternately.

STORAGE

Store protected from light and heat.

LABELLING

The label states:

- the content of pentaerythrityl tetranitrate as a percentage,
- the diluent used.

IMPURITIES

A. inorganic nitrates,

B. pentaerythrityl trinitrate,

C. tripentaerythrityl octanitrate,

D. dipentaerythrityl hexanitrate.

01/2005:1137

PENTAMIDINE DISETIONATE

Pentamidini diisetonas

$C_{23}H_{36}N_4O_{10}S_2$

M_r 592.7

DEFINITION

4,4'-[Pentane-1,5-diylbis(oxy)]dibenzamidine di(2-hydroxyethanesulphonate).

Content: 98.5 per cent to 101.5 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder or colourless crystals, hygroscopic.

Solubility: freely soluble in water, sparingly soluble in alcohol, practically insoluble in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: *pentamidine diisetonate CRS*.

B. Dissolve about 40 mg in 5 ml of *water R* and add dropwise with shaking 1 ml of a 10 g/l solution of *sodium chloride R*. Allow to stand for 5 min. The mixture remains clear.

C. Treat 0.15 g by the oxygen-flask method (2.5.10). Use 10 ml of *dilute hydrogen peroxide solution R* to absorb the combustion products. The solution gives reaction (a) of sulphates (2.3.1).

TESTS

Appearance of solution. The solution is not more opalescent than reference suspension II (2.2.1) and not more intensely coloured than intensity 6 of the range of reference solutions of the most appropriate colour (2.2.2, *Method II*).

Dissolve 2.0 g in *water R* and dilute to 20 ml with the same solvent.

pH (2.2.3): 4.5 to 6.5.

Dissolve 0.5 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 2.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). To 0.1 g in a conical flask, add 40 ml of *water R* and glass beads. Adjust to pH 10.5 with *dilute sodium hydroxide solution R* and boil under reflux for 20 min. Cool and dilute to 50 ml with *water R*. Dilute 1 ml of the solution to 50 ml with the mobile phase.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: octadecylsilyl silica gel for chromatography *R* (5 μ m).

Mobile phase: mix 65 volumes of *methanol R* and 35 volumes of a 30 g/l solution of *ammonium acetate R* previously adjusted to pH 7.5 using *triethylamine R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 265 nm.

Injection: 10 μ l.

Run time: 3.5 times the retention time of pentamidine.

System suitability: reference solution (b):

- the chromatogram obtained shows 2 principal peaks,
- resolution: minimum of 2.0 between the 2 principal peaks.

Limits:

- **any impurity:** not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),
- **total:** not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent),
- **disregard limit:** 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution* (10 ppm *Pb*) *R*.

Loss on drying (2.2.32): maximum 4.0 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 50 ml of *dimethylformamide R*. Add 0.25 ml of *thymol blue solution R*. Titrate with 0.1 *M tetrabutylammonium hydroxide*, under a current of *nitrogen R*, until the colour of the indicator changes to blue. Carry out a blank titration.

1 ml of 0.1 *M tetrabutylammonium hydroxide* is equivalent to 29.63 mg of $C_{23}H_{36}N_4O_{10}S_2$.

STORAGE

In an airtight container.

IMPURITIES

A. 4-[[5-(4-aminidinophenoxy)pentyl]oxy]benzenecarboxamide.

01/2005:1462

PENTAZOCINE

Pentazocinum

$C_{19}H_{27}NO$

M_r 285.4

DEFINITION

Pentazocine contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (2*RS*,6*RS*,11*RS*)-6,11-dimethyl-3-(3-methylbut-2-enyl)-1,2,3,4,5,6-hexahydro-2,6-methano-3-benzazocin-8-ol, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, practically insoluble in water, freely soluble in methylene chloride and soluble in alcohol.

It shows polymorphism.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum for pentazocine (form A)*.

TESTS

Absorbance (2.2.25). Dissolve 0.100 g in a mixture of 20 ml of *water R* and 1 ml of 1 *M hydrochloric acid*, and dilute to 100.0 ml with *water R*. To 10.0 ml add 1 ml of 1 *M hydrochloric acid* and dilute to 100.0 ml with *water R*. The specific absorbance at the maximum at 278 nm is 0.67 to 0.71, calculated with reference to the dried substance.

Related substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*.

Test solution. Dissolve 0.20 g of the substance to be examined in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dilute 1 ml of the test solution to 100 ml with *methylene chloride R*.

Reference solution (b). Dilute 5 ml of reference solution (a) to 10 ml with *methylene chloride R*.

Reference solution (c). Dilute 5 ml of reference solution (a) to 20 ml with *methylene chloride R*.

Apply to the plate 10 μ l of each solution. Develop over a path corresponding to two thirds of the plate height using a mixture of 3 volumes of *isopropylamine R*, 3 volumes of *methanol R* and 94 volumes of *methylene chloride R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Heat the plate at 100 °C to 105 °C for 15 min, allow to cool, expose to iodine vapour and re-examine under ultraviolet light at 254 nm. By each method of

visualisation: any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot obtained with reference solution (a) (1 per cent); not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent) and not more than four such spots are more intense than the spot in the chromatogram obtained with reference solution (c) (0.25 per cent).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying at 60 °C at a pressure not exceeding 0.7 kPa for 4 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 28.54 mg of $C_{19}H_{27}NO$.

STORAGE

Store protected from light.

01/2005:1463

PENTAZOCINE HYDROCHLORIDE

Pentazocini hydrochloridum

 $C_{19}H_{28}ClNO$
 M_r 321.9

DEFINITION

Pentazocine hydrochloride contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (2*RS*,6*RS*,11*RS*)-6,11-dimethyl-3-(3-methylbut-2-enyl)-1,2,3,4,5,6-hexahydro-2,6-methano-3-benzazocin-8-ol hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, sparingly soluble in water, soluble in alcohol and sparingly soluble in methylene chloride.

It shows polymorphism.

IDENTIFICATION

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of pentazocine hydrochloride*.
- It gives reaction (a) of chlorides (2.3.1).

TESTS

pH (2.2.3). Dissolve 0.1 g in 10 ml of *carbon dioxide-free water R*. The pH of the solution is 4.0 to 6.0.

Absorbance (2.2.25). Dissolve 0.100 g in a mixture of 20 ml of *water R* and 1 ml of 1 M *hydrochloric acid*, and dilute to 100.0 ml with *water R*. To 10.0 ml add 1 ml of 1 M

hydrochloric acid and dilute to 100.0 ml with *water R*. The specific absorbance at the maximum at 278 nm is 0.59 to 0.63, calculated with reference to the dried substance.

Related substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*.

Test solution. Dissolve 0.20 g in 3 ml of *methanol R* and dilute to 10 ml with *methylene chloride R*.

Reference solution (a). Dilute 1 ml of the test solution to 100 ml with *methylene chloride R*.

Reference solution (b). Dilute 5 ml of reference solution (a) to 10 ml with *methylene chloride R*.

Reference solution (c). Dilute 5 ml of reference solution (a) to 20 ml with *methylene chloride R*.

Apply to the plate 10 µl of each solution. Develop over a path corresponding to two-thirds of the plate height using a mixture of 3 volumes of *isopropylamine R*, 3 volumes of *methanol R* and 94 volumes of *methylene chloride R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Heat the plate at 100 °C to 105 °C for 15 min, allow to cool, expose to iodine vapour and re-examine under ultraviolet light at 254 nm. By each method of visualisation: any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot obtained with reference solution (a) (1 per cent); not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent); and not more than four such spots are more intense than the spot in the chromatogram obtained with reference solution (c) (0.25 per cent).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying at 60 °C at a pressure not exceeding 0.7 kPa for 4 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 50 ml of *alcohol R*. Add 5 ml of 0.01 M *hydrochloric acid*. Carry out a potentiometric titration (2.2.20), using 0.1 M *sodium hydroxide*. Read the volume added between the two points of inflection.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 32.19 mg of $C_{19}H_{28}ClNO$.

STORAGE

Store protected from light.

01/2005:0200

PENTOBARBITAL

Pentobarbitalum

 $C_{11}H_{18}N_2O_3$
 M_r 226.3

DEFINITION

Pentobarbital contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 5-ethyl-5-[(1*RS*)-1-methylbutyl]pyrimidine-2,4,6(1*H*,3*H*,5*H*)-trione, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder or colourless crystals, very slightly soluble in water, freely soluble in ethanol. It forms water-soluble compounds with alkali hydroxides and carbonates and with ammonia.

IDENTIFICATION

A. Determine the melting point (2.2.14) of the substance to be examined. Mix equal parts of the substance to be examined and *pentobarbital CRS* and determine the melting point of the mixture. The difference between the melting points (which are about 133 °C) is not greater than 2 °C.

B. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 0.1 g of the substance to be examined in *alcohol R* and dilute to 100 ml with the same solvent.

Reference solution. Dissolve 0.1 g of *pentobarbital CRS* in *alcohol R* and dilute to 100 ml with the same solvent.

Apply to the plate 10 µl of each solution. Develop over a path of 18 cm using the lower layer of a mixture of 5 volumes of *concentrated ammonia R*, 15 volumes of *alcohol R* and 80 volumes of *chloroform R*. Examine immediately in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

C. To about 10 mg add about 10 mg of *vanillin R* and 2 ml of *sulphuric acid R*. Mix and heat on a water-bath for 2 min. A reddish-brown colour develops. Cool and add cautiously 5 ml of *ethanol R*. The colour becomes violet and then blue.

TESTS

Appearance of solution. Dissolve 1.0 g in a mixture of 4 ml of *dilute sodium hydroxide solution R* and 6 ml of *water R*. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, *Method II*).

Acidity. Boil 1.0 g with 50 ml of *water R* for 2 min, allow to cool and filter. To 10 ml of the filtrate add 0.15 ml of *methyl red solution R*. The solution is orange-yellow. Not more than 0.1 ml of 0.1 M *sodium hydroxide* is required to produce a pure yellow colour.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 1.0 g of the substance to be examined in *alcohol R* and dilute to 100 ml with the same solvent.

Reference solution. Dilute 0.5 ml of the test solution to 100 ml with *alcohol R*.

Apply to the plate 20 µl of each solution. Develop over a path of 15 cm using the lower layer of a mixture of 5 volumes of *concentrated ammonia R*, 15 volumes of *alcohol R* and 80 volumes of *chloroform R*. Examine immediately in ultraviolet light at 254 nm. Spray with *diphenylcarbazone mercuric reagent R*. Allow the plate to dry in air and spray with freshly prepared *alcoholic potassium hydroxide solution R* diluted 1 in 5 with *aldehyde-free alcohol R*. Heat at 100 °C to 105 °C for 5 min and examine immediately. When examined in ultraviolet light and after spraying, any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Isomer. Dissolve 0.3 g in 5 ml of a 50 g/l solution of *anhydrous sodium carbonate R*, heating slightly if necessary. Add a solution of 0.3 g of *nitrobenzyl chloride R* in 10 ml of *alcohol R* and heat under a reflux condenser for 30 min. Cool to 25 °C, filter and wash the precipitate with five quantities, each of 5 ml, of *water R*. In a small flask, heat the precipitate with 25 ml of *alcohol R* under a reflux condenser until dissolved (about 10 min). Cool to 25 °C, if necessary scratching the wall of the flask with a glass rod to induce crystallisation, and filter. The precipitate, washed with two quantities, each of 5 ml, of *water R* and dried at 100 °C to 105 °C for 30 min, melts (2.2.14) at 136 °C to 148 °C.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in 5 ml of *pyridine R*. Add 0.5 ml of *thymolphthalein solution R* and 10 ml of *silver nitrate solution in pyridine R*. Titrate with 0.1 M *ethanolic sodium hydroxide* until a pure blue colour is obtained. Carry out a blank titration.

1 ml of 0.1 M *ethanolic sodium hydroxide* is equivalent to 11.31 mg of C₁₁H₁₈N₂O₃.

01/2005:0419

PENTOBARBITAL SODIUM

Pentobarbitalum natricum

C₁₁H₁₇N₂NaO₃M_r 248.3

DEFINITION

Pentobarbital sodium contains not less than 99.0 per cent and not more than the equivalent of 101.5 per cent of the sodium derivative of 5-ethyl-5-[(1*RS*)-1-methylbutyl]pyrimidine-2,4,6-(1*H*,3*H*,5*H*)-trione, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder, hygroscopic, very soluble in water.

IDENTIFICATION

A. Dissolve 1 g in 10 ml of *water R* and add 5 ml of *dilute acetic acid R*. A white, crystalline precipitate is formed. Filter, wash the precipitate with *water R* and dry at 100 °C to 105 °C. Determine the melting point (2.2.14) of the precipitate. Mix equal parts of the precipitate and *pentobarbital CRS* and determine the melting point of the mixture. The difference between the melting points (which are about 131 °C) is not greater than 2 °C.

B. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel GF₂₅₄ plate R*.

Test solution. Dissolve 25 mg of the precipitate obtained in identification test A in *alcohol R* and dilute to 25 ml with the same solvent.

Reference solution. Dissolve 25 mg of *pentobarbital CRS* in *alcohol R* and dilute to 25 ml with the same solvent.

Apply to the plate 10 µl of each solution. Develop over a path of 18 cm using the lower layer from a mixture of 5 volumes of *concentrated ammonia R*, 15 volumes of *alcohol R* and 80 volumes of *chloroform R*. Examine immediately in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

C. To about 10 mg add about 10 mg of *vanillin R* and 2 ml of *sulphuric acid R*. Mix and heat on a water-bath for 2 min. A reddish-brown colour develops. Cool and add cautiously 5 ml of *ethanol R*. The colour becomes violet and then blue.

D. Ignite 1 g. The residue gives reaction (a) of sodium (2.3.1).

TESTS

pH (2.2.3). Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent. The pH measured immediately after preparation of the solution is 9.6 to 11.0.

Related substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel GF₂₅₄ plate R*.

Test solution. Dissolve 0.2 g of the substance to be examined in *alcohol R* and dilute to 10 ml with the same solvent.

Reference solution. Dilute 0.5 ml of the test solution to 100 ml with *alcohol R*.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using the lower layer from a mixture of 5 volumes of *concentrated ammonia R*, 15 volumes of *alcohol R* and 80 volumes of *chloroform R*. Examine immediately in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent). Spray with *diphenylcarbazone mercuric reagent R*. Allow the plate to dry in air and spray with freshly prepared *alcoholic potassium hydroxide solution R* diluted 1 in 5 with *aldehyde-free alcohol R*. Heat at 100 °C to 105 °C for 5 min and examine immediately in daylight. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Free pentobarbital. Not more than 3.5 per cent. Dissolve 2.00 g in 75 ml of *dimethylformamide R*, heating gently if necessary. Titrate with 0.1 M *sodium methoxide* until the colour changes from olive-green to blue, using 0.25 ml of a 10 g/l solution of *thymol blue R* in *dimethylformamide R* as indicator. Carry out a blank titration.

1 ml of 0.1 M *sodium methoxide* is equivalent to 22.63 mg of pentobarbital.

Isomer. Dissolve 0.3 g in 5 ml of a 50 g/l solution of *anhydrous sodium carbonate R*. Add a solution of 0.3 g of *nitrobenzyl chloride R* in 10 ml of *alcohol R* and heat under a reflux condenser for 30 min. Cool to 25 °C, if necessary scratching the wall of the container with a glass rod to induce crystallisation. Filter and wash the precipitate with five quantities, each of 5 ml, of *water R*. In a small flask, heat the precipitate with 25 ml of *alcohol R* under a reflux condenser until dissolved (about 10 min). Cool to 25 °C, if necessary scratching the wall of the flask with a glass rod to induce crystallisation, and filter. The precipitate, washed with two quantities, each of 5 ml, of *water R* and dried at 100 °C to 105 °C for 30 min, melts (2.2.14) at 136 °C to 148 °C.

Heavy metals (2.4.8). Dissolve 1.0 g in *water R* and dilute to 10.0 ml with the same solvent. To 9 ml of the solution, add 3 ml of *dilute acetic acid R* and 3 ml of *buffer solution pH 3.5 R* and filter. Dilute the filtrate to 18 ml with *water R*. 12 ml of the solution complies with limit test A for heavy metals (20 ppm). In preparing the test solution, replace the buffer solution with *water R*. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 3.0 per cent, determined on 1.00 g by drying in an oven at 100 °C to 105 °C.

ASSAY

Dissolve 0.200 g in 15 ml of a 127.5 g/l solution of *silver nitrate R* in *pyridine R*. Titrate with 0.1 M *ethanolic sodium hydroxide* until a pure blue colour is obtained, using 0.5 ml of *thymolphthalein solution R* as indicator. Carry out a blank titration.

1 ml of 0.1 M *ethanolic sodium hydroxide* is equivalent to 24.83 mg of C₁₁H₁₇N₂NaO₃.

STORAGE

Store in an airtight container.

01/2005:0851

PENTOXIFYLLINE

Pentoxifyllinum

C₁₃H₁₈N₄O₃

*M*_r 278.3

DEFINITION

Pentoxifylline contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 3,7-dimethyl-1-(5-oxohexyl)-3,7-dihydro-1*H*-purine-2,6-dione, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, soluble in water, freely soluble in methylene chloride, sparingly soluble in alcohol.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. Melting point (2.2.14): 103 °C to 107 °C.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *pentoxifylline CRS*. Examine the substances prepared as discs.

C. Examine the chromatograms obtained in the test for related substances in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

D. It gives the reaction of xanthines (2.3.1).

TESTS

01/2005:1621

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Dilute 4 ml of solution S to 10 ml with *water R*. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₇ (2.2.2, *Method II*).

Acidity. To 8 ml of solution S add 12 ml of *water R* and 0.05 ml of *bromothymol blue solution R1*. The solution is green or yellow. Not more than 0.2 ml of 0.01 M *sodium hydroxide* is required to change the colour of the indicator to blue.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution (a). Dissolve 0.10 g of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methanol R*.

Reference solution (a). Dissolve 20 mg of *pentoxifylline CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 1 ml of test solution (b) to 50 ml with *methanol R*.

Reference solution (c). Dissolve 20 mg of *pentoxifylline CRS* and 20 mg of *theophylline CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Apply separately to the plate 20 µl of each solution. Develop over a path of 10 cm using a mixture of 15 volumes of *methanol R* and 85 volumes of *ethyl acetate R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated principal spots.

Chlorides (2.4.4). Place 20 ml of solution S in a separating funnel and shake with two quantities, each of 20 ml, of *2-methylpropan-1-ol R*. Dilute 10 ml of the aqueous layer to 15 ml with *water R*. The solution complies with the limit test for chlorides (100 ppm).

Sulphates (2.4.13). 15 ml of solution S complies with the limit test for sulphates (200 ppm).

Heavy metals (2.4.8). 2.0 g complies with the limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying over *diphosphorus pentoxide R* at 60 °C at a pressure not exceeding 700 Pa.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 5 ml of *anhydrous acetic acid R*. Add 20 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid* determining the end-point potentiometrically (2.2.20). 1 ml of 0.1 M *perchloric acid* is equivalent to 27.83 mg of C₁₃H₁₈N₄O₃.

STORAGE

Store protected from light.

IMPURITIES

A. theobromine.

PENTOXYVERINE HYDROGEN CITRATE

Pentoxoxyverini hydrogenocitras

C₂₆H₃₉N₂O₁₀M_r 525.6

DEFINITION

2-[2-(Diethylamino)ethoxy]ethyl 1-phenylcyclopentanecarboxylate dihydrogen 2-hydroxypropane-1,2,3-tricarboxylate.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water, very soluble in glacial acetic acid, freely soluble in methanol, soluble in alcohol and in methylene chloride.

mp: about 93 °C.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: *Ph. Eur. reference spectrum of pentoxoxyverine hydrogen citrate.*

B. Dissolve 0.25 g in 5 ml of *water R*. The solution gives the reaction of citrates (2.3.1).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, *Method II*).

pH (2.2.3): 3.3 to 3.7 for solution S.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution. Introduce 5.0 mg of *pentoxoxyverine impurity A CRS* and 5.0 mg of *pentoxoxyverine impurity B CRS* in a conical flask, add 5.0 ml of the test solution and dilute to 100.0 ml with the mobile phase. Dilute 3.0 ml of the solution to 50.0 ml with the mobile phase.

Column:

- **size:** *l* = 0.15 m, Ø = 3.9 mm,
- **stationary phase:** *end-capped octylsilyl silica gel for chromatography R* (5 µm) with a pore size of 10 nm and a carbon loading of 12 per cent,
- **temperature:** 50 °C.

Mobile phase: mix 35 volumes of *acetonitrile R* and 65 volumes of a 0.15 per cent (*m/V*) solution of *sodium heptanesulphonate R* adjusted to pH 3.0 with *dilute sulphuric acid R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 205 nm.

Injection: 20 µl.

Run time: 3 times the retention time of pentoxoxyverine.

Relative retention with reference to pentoxyverine (retention time = about 6 min): impurity B = about 0.8; impurity A = about 1.5.

System suitability: reference solution:

- **resolution:** minimum of 5.0 between the peaks due to pentoxyverine and to impurity A,
- **signal-to-noise ratio:** minimum of 100 for the peak due to pentoxyverine,
- **symmetry factor:** maximum of 2.0 for the peak due to pentoxyverine.

Limits:

- **impurity A:** not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.3 per cent),
- **impurity B:** not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.3 per cent),
- **any other impurity:** not more than one-third of the area of the peak due to pentoxyverine in the chromatogram obtained with the reference solution (0.1 per cent),
- **total of any other impurity:** not more than the area of the peak due to pentoxyverine in the chromatogram obtained with the reference solution (0.3 per cent),
- **disregard limit:** 0.1 times the area of the peak due to pentoxyverine in the chromatogram obtained with the reference solution (0.03 per cent); disregard any peak with a retention time less than or equal to 2.5 min.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C for 4 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.400 g in 70 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 52.56 mg of $C_{26}H_{39}NO_{10}$.

STORAGE

Protected from light.

IMPURITIES

- A. R = H: 1-phenylcyclopentanecarboxylic acid,
 B. R = $CH_2CH_2N(CH_2CH_3)_2$: 2-(diethylamino)ethyl 1-phenylcyclopentanecarboxylate (caramiphen).

01/2005:0406

PEPPERMINT LEAF

Menthae piperitae folium

DEFINITION

Peppermint leaf consists of the whole or cut dried leaves of *Mentha × piperita* L. The whole drug contains not less than 12 ml/kg of essential oil. The cut drug contains not less than 9 ml/kg of essential oil.

CHARACTERS

Peppermint leaf has a characteristic and penetrating odour and a characteristic aromatic taste; it is green to brownish-green, with brownish-violet veins in some varieties. The petioles are green to brownish-violet.

It has the macroscopic and microscopic characters described under Identification tests A and B.

IDENTIFICATION

- A. The leaf is entire, broken or cut, thin, fragile; the entire leaf is 3 cm to 9 cm long and 1 cm to 3 cm wide and often crumpled. The lamina is oval or lanceolate, the apex acuminate, the margin sharply dentate and the base asymmetrical. Venation is pinnate, prominent on the lower surface, with lateral veins leaving the midrib at about 45°. The lower surface is slightly pubescent and secretory trichomes are visible under a lens (6×) as bright yellowish points. The petiole is grooved, usually up to 1 mm in diameter and 0.5 cm to 1 cm long.
- B. Reduce to a powder (355). The powder is brownish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characteristics: leaf-tissue fragments with cells of the epidermis having sinuous-wavy walls and the cuticle striated over the veins and diacytic stomata predominantly present on the lower epidermis; epidermis fragments from near the leaf margin with isodiametric cells straighter-walled showing distinct beading and pitting in anticlinal walls; covering trichomes short, conical, unicellular or bicellular, or elongated, uniseriate with three to eight cells with striated cuticle; glandular trichomes of two types: (a) unicellular base with small, rounded unicellular head 15 µm to 25 µm in diameter; (b) unicellular base with enlarged oval head 55 µm to 70 µm in diameter composed of eight radiating cells; dorsiventral mesophyll fragment with a single palisade layer and four to six layers of spongy parenchyma; yellowish crystals of menthol under the cuticle of secretory cells. Calcium oxalate crystals are absent.

- C. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.
- Test solution.** To 0.2 g of the recently powdered drug add 2 ml of *methylene chloride R*, shake for a few minutes and filter. Evaporate the filtrate to dryness at about 40 °C and dissolve the residue in 0.1 ml of *toluene R*.

Reference solution. Dissolve 50 mg of *menthol R*, 20 µl of *cineole R*, 10 mg of *thymol R* and 10 µl of *menthyl acetate R* in *toluene R* and dilute to 10 ml with the same solvent.

Apply separately to the plate as bands 10 µl of the reference solution and 20 µl of the test solution. Develop over a path of 15 cm using a mixture of 5 volumes of *ethyl acetate R* and 95 volumes of *toluene R*. Allow the plate to dry in air until the solvent has evaporated and examine in ultraviolet light at 254 nm. The chromatogram obtained with the test solution may show a light quenching zone situated just below the level of the zone (thymol) in the chromatogram obtained with the reference solution (carvone, pulegone). Spray with *anisaldehyde solution R* and examine in daylight while heating for 5 min to 10 min at 100 °C to 105 °C. The chromatogram obtained with the reference solution shows, in order of increasing R_f value: in the lower third a deep-blue to violet zone (menthol); a violet-blue to brown zone (cineole); a pink zone (thymol); and a bluish-violet zone (menthyl acetate). The chromatogram obtained with the test solution shows: a zone due to menthol (the most intense); a faint zone due to cineole; at R_f values between those of the

cineole and thymol zones in the chromatogram obtained with the reference solution, it may show light pink, or bluish-grey or greyish-green zones (carvone, pulegone, isomenthone); in the middle of the chromatogram, a bluish-violet zone (menthyl acetate) and just below it a greenish-blue zone (menthone); an intense reddish-violet zone (hydrocarbons) appears near the solvent front; other less intensely coloured zones also appear.

TESTS

Foreign matter (2.8.2). Carry out the determinations using 10 g of the drug.

Foreign organs. Not more than 5 per cent of stems; the diameter of the stems is not greater than 1.5 mm.

Foreign elements. Not more than 2 per cent. Not more than 8 per cent of the leaves show brown stains due to *Puccinia menthae*.

Water (2.2.13). Not more than 110 ml/kg, determined on 20.0 g by distillation.

Total ash (2.4.16). Not more than 15.0 per cent.

Ash insoluble in hydrochloric acid (2.8.1). Not more than 1.5 per cent.

ASSAY

Carry out the determination of essential oils in vegetable drugs (2.8.12). Use 20.0 g of crushed drug, a 500 ml flask, 200 ml of *water R* as the distillation liquid and 0.50 ml of *xylene R* in the graduated tube. Distil at a rate of 3-4 ml/min for 2 h.

STORAGE

Store protected from light.

01/2005:0405

PEPPERMINT OIL

Menthae piperitae aetheroleum

DEFINITION

Essential oil obtained by steam distillation from the fresh aerial parts of the flowering plant of *Mentha × piperita* L.

CHARACTERS

Appearance: a colourless, pale yellow or pale greenish-yellow liquid.

It has a characteristic odour and taste followed by a sensation of cold.

Solubility: miscible with alcohol and with methylene chloride.

IDENTIFICATION

First identification: B.

Second identification: A.

A. Examine the chromatograms obtained in the test for mint oil.

Results A: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
Thymol: a quenching zone	Quenching zones may be present (carvone, pulegone)
Reference solution	Test solution

Results B: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other less intensely coloured zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Menthyl acetate: a violet-blue zone	An intense violet-red zone (near the solvent front) (hydrocarbons) A brownish-yellow zone (menthofuran) A violet-blue zone (menthyl acetate) A greenish-blue zone (menthone)
Thymol: a pink zone	Light pink or greyish-blue or greyish-green zones may be present (carvone, pulegone, isomenthone)
Cineole: a violet-blue to brown zone	A faint violet-blue to brown zone (cineole)
Menthol: an intense blue to violet zone	An intense blue to violet zone (menthol)
Reference solution	Test solution

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results: the characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution. Carvone and pulegone may be present in the chromatogram obtained with the test solution.

TESTS

Relative density (2.2.5): 0.900 to 0.916.

Refractive index (2.2.6): 1.457 to 1.467.

Optical rotation (2.2.7): -10° to -30° .

Acid value (2.5.1): maximum 1.4, determined on 5.0 g diluted in 50 ml of the prescribed mixture of solvents.

Fatty oils and resinified essential oils (2.8.7). It complies with the test for fatty oils and resinified essential oils.

Mint oil

A. Thin-layer chromatography (2.2.27).

Test solution. Mix 0.1 g of the substance to be examined with *toluene R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 50 mg of *menthol R*, 20 µl of *cineole R*, 10 mg of *thymol R* and 10 µl of *menthyl acetate R* in *toluene R* and dilute to 10 ml with the same solvent.

Plate: TLC silica gel F_{254} plate *R*.

Mobile phase: *ethyl acetate R*, *toluene R* (5:95 V/V).

Application: 10 µl of the reference solution and 20 µl of the test solution, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection A: examine in ultraviolet light at 254 nm.

Detection B: spray with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min. Examine immediately in daylight.

Result B: the chromatogram obtained with the test solution shows no blue zone between the zones due to cineole and menthol.

- B. Examine the chromatograms obtained in the test for chromatographic profile.

Results: the chromatogram obtained with the test solution does not show a peak with the retention time of isopulegol that has an area of more than 0.2 per cent of the total area.

Chromatographic profile. Gas chromatography (2.2.28): use the normalisation procedure.

Test solution. Mix 0.20 g of the substance to be examined with *hexane R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 10 µl of *limonene R*, 20 µl of *cineole R*, 40 µl of *menthone R*, 10 µl of *menthofuran R*, 10 µl of *isomenthone R*, 40 µl of *menthyl acetate R*, 20 µl of *isopulegol R*, 60 mg of *menthol R*, 20 µl of *pulegone R*, 10 µl of *piperitone R* and 10 µl of *carvone R* in *hexane R* and dilute to 10.0 ml with the same solvent.

Reference solution (b). Dissolve 5 µl of *isopulegol R* in *hexane R* and dilute to 10 ml with the same solvent. Dilute 0.1 ml to 5 ml with *hexane R*.

Column:

- *material*: fused silica,
- *size*: $l = 60$ m, $\varnothing = 0.25$ mm,
- *stationary phase*: *macrogol 20 000 R* (film thickness 0.25 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 1.5 ml/min.

Split ratio: 1:50.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 10	60
	10 - 70	60 - 180
	70 - 75	180
Injection port		200
Detector		220

Detection: flame ionisation.

Injection: 1 µl.

Elution order: order indicated in the composition of reference solution (a); record the retention times of these substances.

System suitability: reference solution (a):

- *resolution*: minimum 1.5 between the peaks due to limonene and cineole and minimum 1.5 between the peaks due to piperitone and carvone.

Using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of the reference solution in the chromatogram obtained with the test solution (disregard the peak due to hexane).

Determine the percentage content of the components. The limits are within the following ranges:

- *limonene*: 1.0 per cent to 5.0 per cent,
- *cineole*: 3.5 per cent to 14.0 per cent,

- *menthone*: 14.0 per cent to 32.0 per cent,
- *menthofuran*: 1.0 per cent to 9.0 per cent,
- *isomenthone*: 1.5 per cent to 10.0 per cent,
- *menthyl acetate*: 2.8 per cent to 10.0 per cent,
- *isopulegol*: maximum 0.2 per cent,
- *menthol*: 30.0 per cent to 55.0 per cent,
- *pulegone*: maximum 4.0 per cent,
- *carvone*: maximum 1.0 per cent,
- *disregard limit*: peak area obtained with reference solution (b) (0.05 per cent).

The ratio of cineole content to limonene content is minimum 2.

STORAGE

In a well-filled, airtight container, protected from light, at a temperature not exceeding 25 °C.

01/2005:0682
corrected

PEPSIN POWDER

Pepsini pulvis

DEFINITION

Pepsin powder is prepared from the gastric mucosa of pigs, cattle or sheep. It contains gastric proteinases, active in acid medium (pH 1 to 5). It has an activity not less than 0.5 Ph. Eur. U./mg, calculated with reference to the dried substance.

PRODUCTION

The animals from which pepsin powder is derived must fulfil the requirements for the health of animals suitable for human consumption to the satisfaction of the competent authority.

It must have been shown to what extent the method of production allows inactivation or removal of any contamination by viruses or other infectious agents.

CHARACTERS

A white or slightly yellow, crystalline or amorphous powder, hygroscopic, soluble in water, practically insoluble in alcohol. The solution in water may be slightly opalescent with a weak acidic reaction.

IDENTIFICATION

In a mortar, pound 30 mg of *fibrin blue R*. Suspend in 20 ml of *dilute hydrochloric acid R2*. Filter the suspension on a filter paper and wash with *dilute hydrochloric acid R2* until a colourless filtrate is obtained. Perforate the filter paper and wash the *fibrin blue R* through it into a conical flask using 20 ml of *dilute hydrochloric acid R2*. Shake before use. Dissolve a quantity of the substance to be examined, equivalent to not less than 20 Ph. Eur. U., in 2 ml of *dilute hydrochloric acid R2* and adjust to pH 1.6 ± 0.1 . Add 1 ml of this solution to a test-tube containing 4 ml of the fibrin blue suspension, mix and place in a water-bath at 25 °C with gentle shaking. Prepare a blank solution at the same time and in the same manner using 1 ml of *water R*. After 15 min of incubation the blank solution is colourless and the test solution is blue.

TESTS

Loss on drying (2.2.32). Not more than 5.0 per cent, determined on 0.500 g by drying at 60 °C over *diphosphorus pentoxide R* at a pressure not exceeding 670 Pa for 4 h.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10^4 micro-organisms per gram, determined by plate-count. It complies with the tests for *Escherichia coli* and *Salmonella* (2.6.13).

ASSAY

The activity of pepsin powder is determined by comparing the quantity of peptides, non-precipitable by *trichloroacetic acid solution R* and assayed using the *phosphomolybdotungstic reagent R*, which are released per minute from a substrate of *haemoglobin solution R*, with the quantity of such peptides released by *pepsin powder BRP* from the same substrate in the same conditions.

For the test solution and the reference solution, prepare the solution and carry out the dilution at 0 °C to 4 °C.

Avoid shaking and foaming during preparation of the test and reference solutions.

Test solution. Immediately before use, prepare a solution of the substance to be examined expected to contain 0.5 Ph. Eur. U./ml in *dilute hydrochloric acid R2*; before dilution to volume, adjust to pH 1.6 ± 0.1 , if necessary, using *1 M hydrochloric acid*.

Reference solution. Less than 15 min before use, prepare a solution of *pepsin powder BRP* containing 0.5 Ph. Eur. U./ml in *dilute hydrochloric acid R2*; before dilution to volume, adjust to pH 1.6 ± 0.1 , if necessary, using *1 M hydrochloric acid*.

Designate tubes in duplicate T, T_b, S₁, S_{1b}, S₂, S_{2b}, S₃, S_{3b}; designate a tube B.

Add *dilute hydrochloric acid R2* to the tubes as follows:

B: 1.0 ml

S₁ and S_{1b}: 0.5 ml

S₂, S_{2b} and T and T_b: 0.25 ml

Add the reference solution to the tubes as follows:

S₁ and S_{1b}: 0.5 ml

S₂ and S_{2b}: 0.75 ml

S₃ and S_{3b}: 1.0 ml

Add 0.75 ml of the test solution to tubes T and T_b.

Add 10.0 ml of *trichloroacetic acid solution R* to tubes S_{1b}, S_{2b}, S_{3b}, T_b and B. Mix by shaking.

Place the tubes and *haemoglobin solution R* in a water bath at 25 ± 0.1 °C. When temperature equilibrium is reached, add 5.0 ml of *haemoglobin solution R* to tubes B, S_{1b}, S_{2b}, S_{3b} and T_b. Mix.

At time zero add 5.0 ml of *haemoglobin solution R* successively and at intervals of 30 s to tubes S₁, S₂, S₃ and T. Mix immediately after each addition.

Exactly 10 min after adding the *haemoglobin solution R*, stop the reaction by adding, at intervals of 30 s, 10.0 ml of *trichloroacetic acid solution R* to tubes S₁, S₂, S₃ and T (the use of a fast-flowing or blow-out pipette is recommended) and mix.

Filter the contents of each tube (samples and blanks) twice through the same suitable filter paper previously washed with a 50 g/l solution of *trichloroacetic acid R*, then with *water R* and dried. Discard the first 5 ml of filtrate. Place 3.0 ml of each filtrate separately in a tube containing 20 ml of *water R*. Mix.

A suitable filter paper complies with the following test: filter 5 ml of a 50 g/l solution of *trichloroacetic acid R* through a 7 cm disc of white filter paper: the absorbance (2.2.25) of the filtrate, measured at 275 nm using unfiltered *trichloroacetic acid R* solution as the compensation liquid, is less than 0.04.

Add to each tube 1.0 ml of *sodium hydroxide solution R* and 1.0 ml of *phosphomolybdotungstic reagent R*, beginning with the blanks and then the samples of each set, in a known order.

A schematic presentation of the above operations is shown in Table 0682.-1.

After 15 min measure the absorbance (2.2.25) of solutions S₁, S₂, S₃, S_{1b}, S_{2b}, S_{3b} and T at 540 nm using the filtrate obtained from tube B as the compensation liquid. Correct the average absorbance values for the filtrates obtained from tubes S₁, S₂ and S₃ by subtracting the average values obtained for the filtrates from tubes S_{1b}, S_{2b}, S_{3b} respectively.

Draw a calibration curve of the corrected values against volume of reference solution used. Determine the activity of the substance to be examined using the corrected absorbance for the test solution (T – T_b) together with the calibration curve and taking into account the dilution factors.

Table 0682.-1

	Tubes

PERGOLIDE MESILATE

Pergolidi mesilas

C₂₀H₃₀N₂O₃S₂M_r 410.6

DEFINITION

Pergolide mesilate contains not less than 97.5 per cent and not more than 102.0 per cent of (6a*R*,9*R*,10a*R*)-9-[(methylsulphonyl)methyl]-7-propyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-*fg*]quinoline monomethanesulphonate, calculated with reference to the dried substance.

PRODUCTION

The production method must be evaluated to determine the potential for formation of alkyl mesilates, which is particularly likely to occur if the reaction medium contains lower alcohols. Where necessary, the production method is validated to demonstrate that alkyl mesilates are not detectable in the final product.

CHARACTERS

A white or almost white, crystalline powder, slightly soluble in water, sparingly soluble in methanol, slightly soluble in alcohol and in methylene chloride, very slightly soluble in acetone.

IDENTIFICATION

- The specific optical rotation (2.2.7) is –17 to –23, calculated with reference to the dried substance and determined on a solution prepared as follows: dissolve 0.25 g in *dimethylformamide R* and dilute to 25.0 ml with the same solvent.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *pergolide mesilate CRS*. Examine the substances prepared as discs.

TESTS

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 30.0 mg of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol R*. Dilute 1.0 ml of this solution to 10.0 ml with *methanol R*.

Reference solution (b). Dissolve 10 mg of 4,4'-dimethoxybenzophenone *R* in *methanol R* and dilute to 10 ml with the same solvent. To 1 ml of this

solution add 2 ml of the test solution and dilute to 100 ml with *methanol R*. Dilute 1 ml of this solution to 10 ml with *methanol R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *base-deactivated octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min:
 - Mobile phase A.** Mix 5.0 ml of *morpholine for chromatography R* with 995 ml of *water R* and adjust to pH 7.0 with *phosphoric acid R*. Use within 24 h,
 - Mobile phase B.** Mix equal volumes of *acetonitrile R*, *methanol R* and *tetrahydrofuran R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 35	70 → 0	30 → 100	linear gradient
35 - 40	0 → 70	100 → 30	return to initial conditions
40 - 50	70	30	re-equilibration

- as detector a spectrophotometer set at 280 nm, maintaining the temperature of the column at 40 °C.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 20 µl of reference solution (a) is at least 90 per cent of the full scale of the recorder.

Inject 20 µl of reference solution (b). The test is not valid unless, in the chromatogram obtained, the resolution between the peaks corresponding to 4,4'-dimethoxybenzophenone (first peak) and pergolide (second peak) is at least 2.0.

Inject 20 µl of the test solution and 20 µl of reference solution (a).

In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Disregard any peak with an area less than 0.2 times that of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 100-105 °C for 1 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Examine by liquid chromatography (2.2.29).

Solution A. Dissolve 5.0 mg of *DL-methionine R* in 500 ml of 0.01 M hydrochloric acid. Add 500 ml of *methanol R* and mix.

Test solution. Dissolve 65.0 mg of the substance to be examined in solution A and dilute to 100.0 ml with the same solution. Dilute 10.0 ml to 100.0 ml with solution A.

Reference solution. Dissolve 65.0 mg of *pergolide mesilate CRS* in solution A and dilute to 100.0 ml with the same solution. Dilute 10.0 ml to 100.0 ml with solution A.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *base-deactivated octylsilyl silica gel for chromatography R* (5 µm),

– as mobile phase at a flow rate of 1 ml/min a mixture of 1 volume of *acetonitrile R*, 1 volume of *methanol R* and 2 volumes of a mixture prepared as follows: dissolve 2.0 g of *sodium octanesulphonate R* in *water R*, add 1.0 ml of *anhydrous acetic acid R* and dilute to 1000 ml with *water R*,

– as detector a spectrophotometer set at 280 nm, maintaining the temperature of the column at 40 °C.

Inject 20 µl of the reference solution. When the chromatogram is recorded in the prescribed conditions, the retention time of pergolide is about 9 min. Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with the reference solution is at least 50 per cent of the full scale of the recorder. The assay is not valid unless the symmetry factor of the peak due to pergolide is at most 1.5.

Inject 20 µl of the test solution.

Calculate the percentage content of $C_{20}H_{30}N_2O_3S_2$ from the areas of the peaks and the declared content of *pergolide mesilate CRS*.

STORAGE

Store protected from light.

IMPURITIES

Specified impurities: A.

Other detectable impurities: B.

- A. $R = SO-CH_3$: (6a*R*,9*R*,10a*R*)-9-[(methylsulphinyl)methyl]-7-propyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-*fg*]quinoline (pergolide sulfoxide),
- B. $R = SO_2-CH_3$: (6a*R*,9*R*,10a*R*)-9-[(methylsulphonyl)methyl]-7-propyl-4,6,6a,7,8,9,10,10a-octahydroindolo[4,3-*fg*]quinoline (pergolide sulphone).

01/2005:2019

PERINDOPRIL *tert*-BUTYLAMINE

tert-Butylamini perindoprilum

$C_{23}H_{43}N_3O_5$

M_r 441.6

DEFINITION

2-Methylpropan-2-amine (2*S*,3a*S*,7a*S*)-1-[(2*S*)-2-[(1*S*)-1-(ethoxycarbonyl)butyl]amino]propanoyl]octahydro-1*H*-indole-2-carboxylate.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder, slightly hygroscopic.

Solubility: freely soluble in water and in alcohol, sparingly soluble in methylene chloride.

It shows polymorphism.

IDENTIFICATION

A. Specific optical rotation (2.2.7): -66 to -69 (anhydrous substance).

Dissolve 0.250 g in *alcohol R* and dilute to 25.0 ml with the same solvent.

B. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: *perindopril tert-butylamine CRS*.

If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in *methylene chloride R*, evaporate to dryness and record new spectra using the residues.

C. Examine the chromatograms obtained in the test for impurity A.

Results: in the chromatogram obtained with the test solution a spot is observed with the same R_f as the spot with the higher R_f in the chromatogram with reference solution (c) (*tert*-butylamine).

TESTS

Impurity A. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 0.20 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 5 mg of *perindopril impurity A CRS* in *methanol R* and dilute to 25.0 ml with the same solvent.

Reference solution (b). Dilute 5 ml of reference solution (a) to 20 ml with *methanol R*.

Reference solution (c). To 5 ml of reference solution (a) add 5 ml of a 20 g/l solution of *1,1-dimethylethylamine R* in *methanol R*.

Plate: TLC silica gel plate *R*.

Mobile phase: *glacial acetic acid R*, *toluene R*, *methanol R* (1:40:60 V/V/V).

Application: 10 µl; apply the test solution and reference solutions (b) and (c).

Development: in a saturated tank, over 2/3 of the plate.

Drying: in a current of warm air.

Detection: expose to iodine vapour for at least 20 h.

System suitability: the chromatogram obtained with reference solution (c) shows 2 clearly separated spots.

Limit:

- *impurity A*: any spot due to impurity A is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.25 per cent).

Stereochemical purity. Liquid chromatography (2.2.29).

Test solution. Dissolve 20 mg of the substance to be examined in *alcohol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with *alcohol R*.

Reference solution (b). Dissolve 10 mg of *perindopril for stereochemical purity CRS* in *alcohol R* and dilute to 5.0 ml with the same solvent.

Reference solution (c). Dilute 10.0 ml of reference solution (a) to 50.0 ml with *alcohol R*.

Column:

- *size*: $l = 0.25$ m, $\varnothing = 4.6$ mm,

- *stationary phase*: spherical *octadecylsilyl silica gel for chromatography R* (5 µm) with a specific surface area of 450 m²/g and a pore size of 10 nm,
- *temperature*: 50 °C for the column and at least 30 cm of the tubing preceding the column.

Mobile phase: mix, in the following order, 21.7 volumes of *acetonitrile R*, 0.3 volumes of *pentanol R* and 78 volumes of a 1.50 g/l solution of *sodium heptanesulphonate R*, previously adjusted to pH 2.0 with a mixture of equal volumes of *perchloric acid R* and *water R*.

Flow rate: 0.8 ml/min.

Detection: spectrophotometer at 215 nm.

Equilibration: minimum 4 h.

Injection: 10 µl.

Run time: 1.5 times the retention time of perindopril.

Retention time: perindopril = about 100 min.

System suitability:

- *signal-to-noise ratio*: minimum 3 for the principal peak in the chromatogram obtained with reference solution (c),
- *peak-to-valley ratio*: minimum 3, where H_p = height above the baseline of the peak due to impurity I and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to perindopril in the chromatogram obtained with reference solution (b),
- the chromatogram obtained with reference solution (b) is similar to the chromatogram provided with *perindopril for stereochemical purity CRS*.

Limits:

- *any impurity*: not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent); disregard any peak with a retention time less than 0.6 times the retention time of perindopril and any peak with a retention time greater than 1.4 times the retention time of perindopril.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 60 mg of the substance to be examined in mobile phase A and dilute to 20.0 ml with mobile phase A.

Reference solution (a). Dissolve 15 mg of *perindopril for system suitability CRS* in mobile phase A and dilute to 5.0 ml with mobile phase A.

Reference solution (b). Dilute 1.0 ml of the test solution to 200.0 ml with mobile phase A.

Column:

- *size*: $l = 0.25$ m, $\varnothing = 4$ mm,
- *stationary phase*: spherical *octylsilyl silica gel for chromatography R* (4 µm) with a pore size of 6 nm,
- *temperature*: 70 °C.

Mobile phase:

- *mobile phase A*: dissolve 0.92 g of *sodium heptanesulphonate R* in 1000 ml of *water R*, add 1 ml of *triethylamine R* and adjust to pH 2.0 with a mixture of equal volumes of *perchloric acid R* and *water R*,
- *mobile phase B*: *acetonitrile R1*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 1	70	30
1 - 20	70 → 40	30 → 60
20 - 25	40	60
25 - 35	40 → 20	60 → 80
35 - 40	20 → 0	80 → 100
40 - 45	0 → 70	100 → 30

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 215 nm.

Injection: 20 µl.

Relative retention with reference to perindopril (retention time = about 8 min): impurity B = about 0.4; impurity C = about 0.8; impurity D = about 0.9; impurity E = about 1.4; impurity F = about 1.7; impurity G = about 2.2 and 2.3; impurity H = about 3.6 and 3.7.

System suitability: reference solution (a):

- *peak-to-valley ratio*: minimum 10, where H_p = height above the baseline of the peak due to impurity D and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to perindopril.

Limits:

- *impurity B*: not more than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent),
- *impurity E*: not more than 0.8 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent),
- *impurities F, H*: for each impurity, not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),
- *any other impurity*: not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent),
- *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Water (2.5.12): maximum 1.0 per cent, determined on 0.50 g.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.160 g in 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 22.08 mg of C₂₃H₄₃N₃O₅.

STORAGE

In an airtight container.

IMPURITIES

Specified impurities: A, B, E, F, H, I.

Other detectable impurities: C, D, G.

A. (2*S*,3*aS*,7*aS*)-octahydro-1*H*-indole-2-carboxylic acid,B. R = H: (2*S*,3*aS*,7*aS*)-1-[(2*S*)-2-[(1*S*)-1-carboxybutyl]amino]propanoyl]octahydro-1*H*-indole-2-carboxylic acid,E. R = CH(CH₃)₂: (2*S*,3*aS*,7*aS*)-1-[(2*S*)-2-[(1*S*)-1-[(1-methylethoxy)carbonyl]butyl]amino]propanoyl]octahydro-1*H*-indole-2-carboxylic acid,C. R = H: (2*S*)-2-[(3*S*,5*aS*,9*aS*,10*aS*)-3-methyl-1,4-dioxodecahydropyrazino[1,2-*a*]indol-2(1*H*)-yl]pentanoic acid,F. R = C₂H₅: ethyl (2*S*)-2-[(3*S*,5*aS*,9*aS*,10*aS*)-3-methyl-1,4-dioxodecahydropyrazino[1,2-*a*]indol-2(1*H*)-yl]pentanoate,D. (2*S*)-2-[(3*S*,5*aS*,9*aS*,10*aR*)-3-methyl-1,4-dioxodecahydropyrazino[1,2-*a*]indol-2(1*H*)-yl]pentanoic acid,G. (2*S*,3*aS*,7*aS*)-1-[(2*S*)-2-[(5*RS*)-3-cyclohexyl-2,4-dioxo-5-propylimidazolidin-1-yl]propanoyl]octahydro-1*H*-indole-2-carboxylic acid,H. (2*S*,3*aS*,7*aS*)-1-[(2*S*)-2-[(5*RS*)-3-cyclohexyl-2-(cyclohexylimino)-4-oxo-5-propylimidazolidin-1-yl]propanoyl]octahydro-1*H*-indole-2-carboxylic acid,I. (2*S*,3*aS*,7*aS*)-1-[(2*S*)-2-[(1*R*)-1-(ethoxycarbonyl)butyl]amino]propanoyl]octahydro-1*H*-indole-2-carboxylic acid.

PERITONEAL DIALYSIS, SOLUTIONS FOR

Solutiones ad peritonealem dialysim

DEFINITION

Solutions for peritoneal dialysis are preparations for intraperitoneal use containing electrolytes with a concentration close to the electrolytic composition of plasma. They contain glucose in varying concentrations or other suitable osmotic agents.

Solutions for peritoneal dialysis are supplied in:

- rigid or semi-rigid plastic containers,
- flexible plastic containers fitted with a special connecting device; these are generally filled to a volume below their nominal capacity and presented in closed protective envelopes,
- glass containers.

The containers and closures comply with the requirements for containers for preparations for parenteral use (3.2.1 and 3.2.2).

Several formulations are used. The concentrations of the components per litre of solution are usually in the following range:

Table 0862.-1

	Expression in mmol	Expression in mEq
Sodium	125 - 150	125 - 150
Potassium	0 - 4.5	0 - 4.5
Calcium	0 - 2.5	0 - 5.0
Magnesium	0.25 - 1.5	0.50 - 3.0
Acetate and/or lactate and/or hydrogen carbonate	30 - 60	30 - 60
Chloride	90 - 120	90 - 120
Glucose	25 - 250	

When hydrogen carbonate is present, the solution of sodium hydrogen carbonate is supplied in a container or a separate compartment and is added to the electrolyte solution immediately before use.

Unless otherwise justified and authorised, antioxidants such as metabisulphite salts are not added to the solutions.

IDENTIFICATION

According to the stated composition, the solution to be examined gives the following identification reactions (2.3.1):

- potassium: reaction (b);
- calcium: reaction (a);
- sodium: reaction (b);
- chlorides: reaction (a);
- acetates: to 5 ml of the solution to be examined add 1 ml of *hydrochloric acid R* in a test-tube fitted with a stopper and a bent tube, heat and collect a few millilitres of distillate; carry out reaction (b) of acetates on the distillate;
- lactates, hydrogen carbonates; the identification is carried out together with the assay;
- magnesium: to 0.1 ml of *titan yellow solution R* add 10 ml of *water R*, 2 ml of the solution to be examined and 1 ml of 1 M *sodium hydroxide*; a pink colour is produced;
- glucose: to 5 ml of the solution to be examined, add 2 ml of *dilute sodium hydroxide solution R* and 0.05 ml of *copper sulphate solution R*; the solution is blue and clear; heat to boiling; an abundant red precipitate is formed.

TESTS

Appearance of solution. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₄ (2.2.2, *Method I*).

pH (2.2.3). The pH of the solution is 5.0 to 6.5. If the solution contains hydrogen carbonate, the pH is 6.5 to 8.0.

Hydroxymethylfurfural. To a volume of the solution containing the equivalent of 25 mg of glucose, add 5.0 ml of a 100 g/l solution of *p-toluidine R* in 2-propanol *R* containing 10 per cent V/V of *glacial acetic acid R* and 1.0 ml of a 5 g/l solution of *barbituric acid R*. The absorbance (2.2.25) determined at 550 nm after allowing the mixture to stand for 2 min to 3 min is not greater than that of a standard prepared at the same time in the same manner using a solution containing 10 µg of *hydroxymethylfurfural R* in the same volume as the solution to be examined. If the solution contains hydrogen carbonate, use as the standard a solution containing 20 µg of *hydroxymethylfurfural R*.

Aluminium (2.4.17). Take 400 ml, adjust to pH 6.0 and add 10 ml of *acetate buffer solution pH 6.0 R*. The solution complies with the limit test for aluminium (15 µg/l). Use as the reference solution a mixture of 3 ml of *aluminium standard solution (2 ppm Al) R*, 10 ml of *acetate buffer solution pH 6.0 R* and 9 ml of *water R*. To prepare the blank use a mixture of 10 ml of *acetate buffer solution pH 6.0 R* and 10 ml of *water R*.

Particulate contamination. Carry out the test for sub-visible particles (2.9.19) using 50 ml of solution.

Table 0862-2

Particles larger than	10 µm	25 µm
Maximum number of particles per millilitre	25	3

Extractable volume (2.9.17). The solution complies with the test prescribed for parenteral infusions.

Sterility (2.6.1). The solution complies with the test for sterility.

Bacterial endotoxins (2.6.14): less than 0.25 IU/ml.

Pyrogens (2.6.8). Solutions for which a validated test for bacterial endotoxins cannot be carried out comply with the test for pyrogens. Inject per kilogram of the rabbit's mass 10 ml of the solution.

ASSAY

Sodium: 97.5 per cent to 102.5 per cent of the content of sodium (Na) stated on the label, determined by atomic absorption spectrometry (2.2.23, *Method II*).

Test solution. If necessary, dilute the solution to be examined with *water R* to a concentration suitable for the instrument to be used.

Reference solutions. Prepare the reference solutions using *sodium standard solution (200 ppm Na) R*.

Measure the absorbance at 589.0 nm using a sodium hollow-cathode lamp as source of radiation and an air-propane or an air-acetylene flame.

Potassium. 95.0 per cent to 105.0 per cent of the content of potassium (K) stated on the label, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. If necessary, dilute the solution to be examined with *water R* to a concentration suitable for the instrument to be used. To 100 ml of the solution add 10 ml of a 22 g/l solution of *sodium chloride R*.

Reference solutions. Prepare the reference solutions using *potassium standard solution (100 ppm K) R*. To 100 ml of each reference solution add 10 ml of a 22 g/l solution of *sodium chloride R*.

Measure the absorbance at 766.5 nm, using a potassium hollow-cathode lamp as source of radiation and an air-propane or an air-acetylene flame.

Calcium. 95.0 per cent to 105.0 per cent of the content of calcium (Ca) stated on the label, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. If necessary, dilute the solution to be examined with *water R* to a concentration suitable for the instrument to be used.

Reference solutions. Prepare the reference solutions using *calcium standard solution (400 ppm Ca) R*.

Measure the absorbance at 422.7 nm using a calcium hollow-cathode lamp as source of radiation and an air-propane or an air-acetylene flame.

Magnesium: 95.0 per cent to 105.0 per cent of the content of magnesium (Mg) stated on the label, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. If necessary, dilute the solution to be examined with *water R* to a concentration suitable for the instrument to be used.

Reference solutions. Prepare the reference solutions using *magnesium standard solution (100 ppm Mg) R*.

Measure the absorbance at 285.2 nm using a magnesium hollow-cathode lamp as source of radiation and an air-propane or an air-acetylene flame.

Total chloride. 95.0 per cent to 105.0 per cent of the content of chloride (Cl) stated on the label. Dilute to 50 ml with *water R* an accurately measured volume of the solution to be examined containing the equivalent of about 60 mg of chloride. Add 5 ml of *dilute nitric acid R*, 25.0 ml of 0.1 M *silver nitrate* and 2 ml of *dibutyl phthalate R*. Shake.

Using 2 ml of *ferric ammonium sulphate solution R2* as indicator, titrate with 0.1 M *ammonium thiocyanate* until a reddish-yellow colour is obtained.

1 ml of 0.1 M *silver nitrate* is equivalent to 3.545 mg of Cl.

Acetate: 95.0 per cent to 105.0 per cent of the content of acetate stated on the label. To a volume of the solution to be examined, corresponding to about 0.7 mmol of acetate, add 10.0 ml of 0.1 M *hydrochloric acid*. Carry out a potentiometric titration (2.2.20), using 0.1 M *sodium hydroxide*. Read the volume added between the two points of inflexion.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 0.1 mmol of acetate.

Lactate: 95.0 per cent to 105.0 per cent of the content of lactate stated on the label. To a volume of the solution to be examined, corresponding to about 0.7 mmol of lactate, add 10.0 ml of 0.1 M *hydrochloric acid*. Then add 50 ml of *acetonitrile R*. Carry out a potentiometric titration (2.2.20), using 0.1 M *sodium hydroxide*. Read the volume added between the two points of inflexion.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 0.1 mmol of lactate.

Sodium hydrogen carbonate: 95.0 per cent to 105.0 per cent of the content of sodium hydrogen carbonate stated on the label. Titrate with 0.1 M *hydrochloric acid*, a volume of the solution to be examined corresponding to about 0.1 g of sodium hydrogen carbonate, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *hydrochloric acid* is equivalent to 8.40 mg of NaHCO_3 .

Lactate and hydrogen carbonate: 95.0 per cent to 105.0 per cent of the content of lactates and/or hydrogen carbonates stated on the label. Examine by liquid chromatography (2.2.29).

Test solution. Solution to be examined.

Reference solution. Dissolve in 100 ml of *water for chromatography R* quantities of lactates and hydrogen carbonates, accurately weighed, in order to obtain solutions having concentrations representing about 90 per cent, 100 per cent and 110 per cent of the concentrations indicated on the label.

The chromatographic procedure may be carried out using:

- a column 0.30 m long and 7.8 mm in internal diameter packed with *cation exchange resin R* (9 µm),
 - as mobile phase at a flow rate of 0.6 ml/min 0.005 M *sulphuric acid* previously degassed with *helium R*,
 - a differential refractometer detector,
- maintaining the temperature of the column at 85 °C.

Inject in duplicate 20 µl of test solution and 20 µl of each reference solution. When the chromatograms are recorded in the prescribed conditions, the peaks elute in the following order: lactates then hydrogen carbonates.

Determine the concentration of lactates and hydrogen carbonates in the test solution by interpolating the peak area for lactate and the peak height for hydrogen carbonate from the linear regression curve obtained with the reference solutions.

Reducing sugars (expressed as anhydrous glucose). 95.0 per cent to 105.0 per cent of the content of glucose stated on the label. Transfer a volume of solution to be examined containing the equivalent of 25 mg of glucose to a 250 ml conical flask with a ground-glass neck and add 25.0 ml of *cupri-citric solution R*. Add a few grains of pumice, fit a reflux condenser, heat so that boiling occurs within 2 min and boil for exactly 10 min. Cool and add 3 g of *potassium*

iodide R dissolved in 3 ml of *water R*. Carefully add, in small amounts, 25 ml of a 25 per cent *m/m* solution of *sulphuric acid R*. Titrate with 0.1 M *sodium thiosulphate* using *starch solution R*, added towards the end of the titration, as indicator. Carry out a blank titration using 25.0 ml of *water R*.

Calculate the content of reducing sugars expressed as anhydrous glucose ($\text{C}_6\text{H}_{12}\text{O}_6$), by means of Table 0862-3:

Table 0862-3

Volume of 0.1 M sodium thiosulphate (ml)	Anhydrous glucose (mg)
8	19.8
9	22.4
10	25.0
11	27.6
12	30.3
13	33.0
14	35.7
15	38.5
16	41.3

STORAGE

Store at a temperature not below 4 °C.

LABELLING

The label states:

- the formula of the solution for peritoneal dialysis, expressed in grams per litre and in millimoles per litre,
- the calculated osmolarity, expressed in milliosmoles per litre,
- the nominal volume of the solution for peritoneal dialysis in the container,
- that the solution is free from bacterial endotoxins, or where applicable, that it is apyrogenic,
- the storage conditions,
- that the solution is not to be used for intravenous infusion,
- that any unused portion of solution is to be discarded.

01/2005:0629

PERPHENAZINE

Perphenazinum

$\text{C}_{21}\text{H}_{26}\text{ClN}_3\text{OS}$

M_r 404.0

DEFINITION

Perphenazine contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 2-[4-[3-(2-chlorophenothiazin-10-yl)propyl]piperazin-1-yl]ethanol, calculated with reference to the dried substance.

CHARACTERS

A white or yellowish-white, crystalline powder, practically insoluble in water, freely soluble in methylene chloride, soluble in alcohol. It dissolves in dilute solutions of hydrochloric acid.

IDENTIFICATION

First identification: A, C

Second identification: A, B, D.

- A. Melting point (2.2.14): 96 °C to 100 °C.
- B. Dissolve 10 mg in *methanol R* and dilute to 100 ml with the same solvent. Dilute 10 ml of the solution to 100 ml with *methanol R*. Examined between 230 nm and 350 nm (2.2.25), the solution shows two absorption maxima, at 257 nm and 313 nm. The ratio of the absorbance measured at the maximum at 313 nm to that measured at the maximum at 257 nm is 0.120 to 0.128.
- C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *perphenazine CRS*. Examine the substances prepared as discs.
- D. Examine by thin-layer chromatography (2.2.27), using *kieselguhr G R* as the coating substance. Impregnate the plate by placing it in a closed tank containing the necessary quantity of the impregnation mixture containing 2.5 per cent V/V of *phenoxyethanol R* and 7.5 per cent V/V of *formamide R* in *acetone R* so that the plate dips about 5 mm beneath the surface of the liquid. When the impregnation mixture has risen at least 17 cm from the lower edge of the plate, remove the plate and use immediately for chromatography. Carry out the chromatography in the same direction as the impregnation.

Test solution. Dissolve 20 mg of the substance to be examined in *chloroform R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 20 mg of *perphenazine CRS* in *chloroform R* and dilute to 10 ml with the same solvent. Apply separately to the plate 2 µl of each solution. Develop in the dark over a path of 15 cm using a mixture of 2 volumes of *diethylamine R* and 100 volumes of *light petroleum R*, saturated with phenoxyethanol (add *phenoxyethanol R* - 6 volumes to 8 volumes - to the above mixture of solvents until there is a persistent cloudiness after shaking, decant, and use the supernatant liquid, even if it is cloudy). Expose the plate to ultraviolet light at 365 nm and examine after a few minutes. The principal spot in the chromatogram obtained with the test solution is similar in position, fluorescence and size to the principal spot in the chromatogram obtained with the reference solution. Dry the plate at 120 °C for 20 min, allow to cool and spray with a 10 per cent V/V solution of *sulphuric acid R* in *alcohol R*. The principal spot in the chromatogram obtained with the test solution is of the same colour as the principal spot in the chromatogram obtained with the reference solution.

TESTS

Appearance of solution. Dissolve 0.20 g in 10 ml of *methanol R*. The solution is clear (2.2.1).

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance. Prepare the solutions immediately before use.

Test solution. Dissolve 0.1 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution. Dilute 0.5 ml of the test solution to 100 ml with *methanol R*.

Apply separately to the plate 10 µl of each solution.

Develop over a path of 15 cm using a mixture of 1 volume of *concentrated ammonia R*, 14 volumes of *water R* and 85 volumes of *butanol R*. Allow the plate to dry in air. Examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 65 °C for 4 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.1500 g in 25 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid* determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 20.20 mg of C₂₁H₂₆ClN₃OS.

STORAGE

Store protected from light.

01/2005:0754

PERU BALSAM

Balsamum peruvianum

DEFINITION

Peru balsam is the balsam obtained from the scorched and wounded trunk of *Myroxylon balsamum* (L.) Harms var. *pereirae* (Royle) Harms. It contains not less than 45.0 per cent *m/m* and not more than 70.0 per cent *m/m* of esters, mainly benzyl benzoate and benzyl cinnamate.

CHARACTERS

A dark brown, viscous liquid which is transparent and yellowish-brown when viewed in a thin layer; the liquid is not sticky, it is non-drying and does not form threads; practically insoluble in water, freely soluble in ethanol, not miscible with fatty oils, except for castor oil.

IDENTIFICATION

- A. Dissolve 0.20 g in 10 ml of *alcohol R*. Add 0.2 ml of *ferric chloride solution R1*. A green to olive-green colour develops.
- B. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.
- Test solution.* Dissolve 0.5 g of the substance to be examined in 10 ml of *ethyl acetate R*.
- Reference solution.* Dissolve 4 mg of *thymol R*, 30 mg of *benzyl cinnamate R* and 80 µl of *benzyl benzoate R* in 5 ml of *ethyl acetate R*.

Apply separately to the plate as bands 20 mm by 3 mm 10 µl of each solution. Develop twice over a path of 10 cm using a mixture of 0.5 volumes of *glacial acetic acid R*, 10 volumes of *ethyl acetate R* and 90 volumes of *hexane R*. Allow the plate to dry in air, examine in ultraviolet light at 254 nm and mark the quenching zones. The chromatogram obtained with the reference solution shows in the upper third two quenching zones, the higher one corresponding to benzyl benzoate and the lower one to benzyl cinnamate. The chromatogram obtained with the test solution shows two quenching zones at the same levels and of approximately the same size. Spray the plate with a freshly prepared 200 g/l

solution of *phosphomolybdic acid R* in *alcohol R*, using 10 ml for a plate 200 mm square and examine the plate in daylight while heating at 100 °C to 105 °C for 5 min to 10 min. The zones due to benzyl benzoate and benzyl cinnamate are coloured blue against a yellow background. The chromatogram obtained with the reference solution shows at about the middle a violet-grey zone (thymol). In the chromatogram obtained with the test solution, a blue zone (nerolidol) is seen just below the level of the zone due to thymol in the chromatogram obtained with the reference solution. Just below the zone due to nerolidol, no blue zone is seen corresponding to a quenching zone seen when examined in ultraviolet light at 254 nm (colophony). In the upper and lower part of the chromatogram obtained with the test solution, other faint blue zones may be seen.

TESTS

Relative density (2.2.5): 1.14 to 1.17.

Saponification value (2.5.6): 230 to 255, determined on the residue obtained in the assay.

Artificial balsams. Shake 0.20 g with 6 ml of *light petroleum R1*. The light petroleum solution is clear and colourless and the whole of the insoluble parts of the balsam stick to the wall of the test-tube.

Fatty oils. Shake 1 g with 3 ml of a 1000 g/l solution of *chloral hydrate R*. The resulting solution is as clear as the 1000 g/l solution of *chloral hydrate R*.

Turpentine. Evaporate to dryness 4 ml of the solution obtained in the test for artificial balsams. The residue has no odour of turpentine.

ASSAY

To 2.50 g in a separating funnel add 7.5 ml of *dilute sodium hydroxide solution R* and 40 ml of *peroxide-free ether R* and shake vigorously for 10 min. Separate the lower layer and shake it with three quantities, each of 15 ml, of *peroxide-free ether R*. Combine the ether layers, dry over 10 g of *anhydrous sodium sulphate R* and filter. Wash the sodium sulphate with two quantities, each of 10 ml, of *peroxide-free ether R*. Combine the ether layers and evaporate to dryness. Dry the residue (esters) at 100 °C to 105 °C for 30 min and weigh.

STORAGE

Store protected from light.

01/2005:0420

PETHIDINE HYDROCHLORIDE

Pethidini hydrochloridum

C₁₅H₂₂ClNO₂M_r 283.8

DEFINITION

Ethyl 1-methyl-4-phenylpiperidine-4-carboxylate hydrochloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

PRODUCTION

If intended for use in the manufacture of parenteral dosage forms, the manufacturing process is validated to show that the content of impurity B is not more than 0.1 ppm.

CHARACTERS

Appearance: white, crystalline powder.

Solubility: very soluble in water, freely soluble in alcohol.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. Melting point (2.2.14): 187 °C to 190 °C.

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of pethidine hydrochloride.

C. Dissolve 0.1 g in 10 ml of *ethanol R* and add 10 ml of *picric acid solution R*. A crystalline precipitate is formed which, when washed with *water R* and dried at 100–105 °C, melts (2.2.14) at 186 °C to 193 °C. Mix equal quantities of the precipitate and the substance to be examined and determine the melting point of the mixture. The melting point is at least 20 °C lower than that of the precipitate.

D. To 5 ml of solution S (see Tests) add 5 ml of *water R*. The solution gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 0.5 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, Method II).

Acidity or alkalinity. To 10 ml of solution S add 0.2 ml of *methyl red solution R* and 0.2 ml of 0.01 M *sodium hydroxide*. The solution is yellow. Add 0.3 ml of 0.01 M *hydrochloric acid*. The solution is red.

Impurity B. Liquid chromatography (2.2.29).

Test solution (a). Dissolve 0.100 g of the substance to be examined in a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R* and dilute to 25.0 ml with the same mixture of solvents.

Test solution (b). Dissolve 0.125 g of the substance to be examined in a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R* and dilute to 10.0 ml with the same mixture of solvents.

Reference solution (a). Dilute 0.5 ml of test solution (a) to 100.0 ml with a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R*.

Reference solution (b). Dissolve 10.0 mg of *pethidine impurity A CRS* in a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R* and dilute to 100.0 ml with the same mixture of solvents.

Reference solution (c). Dissolve 12.5 mg of *1-methyl-4-phenyl-1,2,3,6-tetrahydropyridine R* in a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R* and dilute to 10.0 ml with the same mixture of solvents. Dilute 1.0 ml of the solution to 100.0 ml with a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R*.

Reference solution (d). Dilute 5.0 ml of reference solution (b) and 1.0 ml of reference solution (c) to 100.0 ml with a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R*.

Column:

— size: *l* = 0.25 m, Ø = 4.0 mm,

- *stationary phase*: spherical *end-capped octadecylsilyl silica gel for chromatography R* (5 µm) with a specific surface area of 340 m²/g, a pore size of 10 nm and a carbon loading of 19 per cent.

Mobile phase:

- *mobile phase A*: mix equal volumes of a 42.0 g/l solution of *sodium perchlorate R* and of a 11.6 g/l solution of *phosphoric acid R*, adjust to pH 2.0 with *triethylamine R*,
- *mobile phase B*: *acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 15	80 → 75	20 → 25
15 - 31	75 → 55	25 → 45
31 - 40	55	45
40 - 41	55 → 80	45 → 20
41 - 50	80	20

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 50 µl; inject test solution (b) and reference solution (d).

Relative retention with reference to pethidine (retention time = about 24 min): impurity B = about 0.66; impurity A = about 0.68.

System suitability: reference solution (d):

- *signal-to-noise ratio*: minimum 10 for the first peak,
- *peak-to-valley ratio*: minimum 4, where H_p = height above the baseline of the peak due to impurity B, and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to impurity A.

Limit:

- *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (d) (10 ppm) if intended for non-parenteral use.

Related substances. Liquid chromatography (2.2.29) as described in the test for impurity B with the following modifications.

Injection: 20 µl; inject test solution (a) and reference solution (a).

Limits:

- *any impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent),
- *disregard limit*: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.220 g in 50 ml of *alcohol R*. Add 5.0 ml of 0.01 M *hydrochloric acid*. Titrate with 0.1 M *sodium hydroxide* determining the end-point potentiometrically (2.2.20). Read the volume added between the 2 points of inflexion.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 28.38 mg of C₁₅H₁₂N₂O.

STORAGE

In an airtight container, protected from light.

LABELLING

The label states, where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms.

IMPURITIES

- A. R1 = CH₃, R2 = H: 1-methyl-4-phenylpiperidine (MPP),
- C. R1 = CH₃, R2 = CO₂H: 1-methyl-4-phenylpiperidine-4-carboxylic acid,
- D. R1 = CH₃, R2 = CO₂-CH₃: methyl 1-methyl-4-phenylpiperidine-4-carboxylate,
- E. R1 = H, R2 = CO₂-CH₂-CH₃: ethyl 4-phenylpiperidine-4-carboxylate,
- F. R1 = CH₂-C₆H₅, R2 = CO₂H: 1-benzyl-4-phenylpiperidine-4-carboxylic acid,
- G. R1 = CH₃, R2 = CO₂-CH(CH₃)₂: 1-methylethyl 1-methyl-4-phenylpiperidine-4-carboxylate,
- H. R1 = CH₂-C₆H₅, R2 = CO₂-CH₂-CH₃: ethyl 1-benzyl-4-phenylpiperidine-4-carboxylate,
- J. R1 = CH₂-CH₃, R2 = CO₂-CH₂-CH₃: ethyl 1-ethyl-4-phenylpiperidine-4-carboxylate,

- B. 1-methyl-4-phenyl-1,2,3,6-tetrahydropyridine (MPTP),

and enantiomer

- I. ethyl (4RS)-1-methyl-4-phenyl-1,2,3,4-tetrahydropyridine-4-carboxylate.

01/2005:0421

PHENAZONE

Phenazonum

C₁₁H₁₂N₂O

M_r 188.2

DEFINITION

Phenazone contains not less than 99.0 per cent and not more than the equivalent of 100.5 per cent of 1,5-dimethyl-2-phenyl-1,2-dihydro-3H-pyrazol-3-one, calculated with reference to the dried substance.

CHARACTERS

01/2005:1357

A white or almost white, crystalline powder or colourless crystals, very soluble in water, in alcohol and in methylene chloride.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

- A. Melting point (2.2.14): 109 °C to 113 °C.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *phenazone CRS*. Examine the substances prepared as discs using *potassium bromide R*.
- C. To 1 ml of solution S (see Tests) add 4 ml of *water R* and 0.25 ml of *dilute sulphuric acid R*. Add 1 ml of *sodium nitrite solution R*. A green colour develops.
- D. To 1 ml of solution S add 4 ml of *water R* and 0.5 ml of *ferric chloride solution R2*. A red colour develops which is discharged on the addition of *dilute sulphuric acid R*.

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *phenolphthalein solution R*. The solution is colourless. Add 0.2 ml of 0.01 M *sodium hydroxide*. The solution is red. Add 0.25 ml of *methyl red solution R* and 0.4 ml of 0.01 M *hydrochloric acid*. The solution is red or yellowish-red.

Chlorides (2.4.4). 10 ml of solution S diluted to 15 ml with *water R* complies with the limit test for chlorides (100 ppm).

Sulphates (2.4.13). Dissolve 1.5 g in *distilled water R* and dilute to 15 ml with the same solvent. The solution complies with the limit test for sulphates (100 ppm).

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (1 ppm Pb R)*.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C for 6 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in 20 ml of *water R*. Add 2 g of *sodium acetate R* and 25.0 ml of 0.05 M *iodine*. Allow to stand protected from light for 30 min. Add 25 ml of *methylene chloride R* and shake until the precipitate dissolves. Titrate with 0.1 M *sodium thiosulphate*, using 1 ml of *starch solution R*, added towards the end of the titration, as indicator. Carry out a blank titration.

1 ml of 0.05 M *iodine* is equivalent to 9.41 mg of $C_{20}H_{24}N_2O_4$.

STORAGE

Store protected from light.

PHENIRAMINE MALEATE

Pheniramine maleate

DEFINITION

Pheniramine maleate contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of (3*RS*)-*N,N*-dimethyl-3-phenyl-3-(pyridin-2-yl)propan-1-amine (*Z*)-butenedioate, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder, very soluble in water, freely soluble in alcohol, in methanol and in methylene chloride.

IDENTIFICATION

First identification: C, D.

Second identification: A, B, D.

- A. Melting point (2.2.14): 106 °C to 109 °C.
- B. Dissolve 40.0 mg in 0.1 M *hydrochloric acid* and dilute to 100.0 ml with the same acid. Dilute 5.0 ml of this solution to 50.0 ml with 0.1 M *hydrochloric acid*. Examined between 220 nm and 320 nm (2.2.25), the solution shows a shoulder at 261 nm and an absorption maximum at 265 nm. The specific absorbance at the maximum is 200 to 220.
- C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *pheniramine maleate CRS*. Examine the substances prepared as discs.
- D. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 0.10 g of the substance to be examined in *methanol R* and dilute to 5.0 ml with the same solvent.

Reference solution (a). Dissolve 65 mg of *maleic acid R* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 0.10 g of *pheniramine maleate CRS* in *methanol R* and dilute to 5.0 ml with the same solvent.

Apply to the plate 5 µl of each solution. Develop over a path of 12 cm using a mixture of 3 volumes of *water R*, 7 volumes of *anhydrous formic acid R*, 20 volumes of *methanol R* and 70 volumes of *di-isopropyl ether R*. Examine in ultraviolet light at 254 nm. The chromatogram obtained with the test solution shows two clearly separated spots. The upper spot is similar in position and size to the spot in the chromatogram obtained with reference solution (a). The lower spot is similar in position and size to the spot in the chromatogram obtained with reference solution (b).

TESTS

Solution S. Dissolve 2.0 g in *water R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, *Method II*).

pH (2.2.3). Dissolve 0.20 g in 20.0 ml of *carbon dioxide-free water R*. The pH of the solution is 4.5 to 5.5.

Optical rotation (2.2.7). The angle of optical rotation, determined on solution S, is -0.10° to $+0.10^{\circ}$.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 20.0 mg of the substance to be examined in a mixture of 1 volume of *acetonitrile R* and 9 volumes of mobile phase A and dilute to 20.0 ml with the same mixture of solvents.

Reference solution (a). Dissolve 10.0 mg of *2-benzylpyridine R* in 10.0 ml of the test solution. Dilute to 100.0 ml with a mixture of 1 volume of *acetonitrile R* and 9 volumes of mobile phase A.

Reference solution (b). Dilute 2.0 ml of the test solution to 100.0 ml with a mixture of 1 volume of *acetonitrile R* and 9 volumes of mobile phase A. Dilute 1.0 ml of this solution to 10.0 ml with a mixture of 1 volume of *acetonitrile R* and 9 volumes of mobile phase A.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.30 m long and 3.9 mm in internal diameter packed with *dimethyloctadecylsilyl silica gel for chromatography R* (10 μ m),
- as mobile phase at a flow rate of 1 ml/min:

Mobile phase A. A 5.056 g/l solution of *sodium heptanesulphonate R* adjusted to pH 2.5 with *phosphoric acid R*,

Mobile phase B. *Acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0	90	10	equilibration
0 - 35	90 $\rightarrow$ 62	10 $\rightarrow$ 38	linear gradient
35 - 37	62 $\rightarrow$ 90	38 $\rightarrow$ 10	linear gradient

- as detector a spectrophotometer set at 264 nm.

Inject 20 μ l of each solution. Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with reference solution (b) is at least 50 per cent of the full scale of the recorder. The test is not valid unless: the chromatogram obtained with reference solution (a) shows three principal peaks (maleic acid, 2-benzylpyridine and pheniramine in order of elution); the resolution between the peaks corresponding to 2-benzylpyridine and pheniramine is at least 8. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak and the peak due to maleic acid, is not greater than the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent); the sum of the areas of all the peaks, apart from the principal peak and the peak due to maleic acid, is not greater than five times the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent). Disregard any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) *R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 60 $^{\circ}$ C *in vacuo* for 3 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.260 g in 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 17.82 mg of C₂₀H₂₄N₂O₄.

STORAGE

Store protected from light.

IMPURITIES

A. R = H: 2-benzylpyridine,

D. R = CH₂-CH₂-N(CH₃)₂: *N,N,N',N'*-tetramethyl-3-phenyl-3-(pyridin-2-yl)pentane-1,5-diamine.

B. R = R' = H: 4-benzylpyridine,

C. R = CH₂-CH₂-N(CH₃)₂, R' = H: (3*RS*)-*N,N*-dimethyl-3-phenyl-3-(pyridin-4-yl)propan-1-amine.

01/2005:0201

PHENOBARBITAL

Phenobarbitalum

C₁₂H₁₂N₂O₃*M*_r 232.2

DEFINITION

Phenobarbital contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 5-ethyl-5-phenylpyrimidine-2,4,6(1*H*,3*H*,5*H*)-trione, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder or colourless crystals, very slightly soluble in water, freely soluble in alcohol. It forms water-soluble compounds with alkali hydroxides and carbonates and with ammonia.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

- A. Determine the melting point (2.2.14) of the substance to be examined. Mix equal parts of the substance to be examined and *phenobarbital CRS* and determine the melting point of the mixture. The difference between the melting points (which are about 176 °C) is not greater than 2 °C.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *phenobarbital CRS*.
- C. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 0.1 g of the substance to be examined in *alcohol R* and dilute to 100 ml with the same solvent.

Reference solution. Dissolve 0.1 g of *phenobarbital CRS* in *alcohol R* and dilute to 100 ml with the same solvent.

Apply separately to the plate 10 µl of each solution. Develop over a path of 18 cm using the lower layer of a mixture of 5 volumes of *concentrated ammonia R*, 15 volumes of *alcohol R* and 80 volumes of *chloroform R*. Examine immediately in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

- D. It gives the reaction of non-nitrogen substituted barbiturates (2.3.1).

TESTS

Appearance of solution. Dissolve 1.0 g in a mixture of 4 ml of *dilute sodium hydroxide solution R* and 6 ml of *water R*. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, *Method II*).

Acidity. Boil 1.0 g with 50 ml of *water R* for 2 min, allow to cool and filter. To 10 ml of the filtrate add 0.15 ml of *methyl red solution R*. The solution is orange-yellow. Not more than 0.1 ml of 0.1 M *sodium hydroxide* is required to produce a pure yellow colour.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 1.0 g of the substance to be examined in *alcohol R* and dilute to 100 ml with the same solvent.

Reference solution. Dilute 0.5 ml of the test solution to 100 ml with *alcohol R*.

Apply separately to the plate 20 µl of each solution. Develop over a path of 15 cm using the lower layer of a mixture of 5 volumes of *concentrated ammonia R*, 15 volumes of *alcohol R* and 80 volumes of *chloroform R*. Examine immediately in ultraviolet light at 254 nm. Spray with *diphenylcarbazone mercuric reagent R*. Allow the plate to dry in air and spray with freshly prepared *alcoholic potassium hydroxide solution R* diluted 1 in 5 with *aldehyde-free alcohol R*. Heat at 100 °C to 105 °C for 5 min and examine immediately. When examined in ultraviolet light and after spraying, any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.00 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in 5 ml of *pyridine R*. Add 0.5 ml of *thymolphthalein solution R* and 10 ml of *silver nitrate solution in pyridine R*. Titrate with 0.1 M *ethanolic sodium hydroxide* until a pure blue colour is obtained. Carry out a blank titration.

1 ml of 0.1 M *ethanolic sodium hydroxide* is equivalent to 11.61 mg of C₁₂H₁₁N₂O₃.

01/2005:0630

PHENOBARBITAL SODIUM

Phenobarbitalum natricum

C₁₂H₁₁N₂NaO₃

M_r 254.2

DEFINITION

Phenobarbital sodium contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of the sodium derivative of 5-ethyl-5-phenylpyrimidine-2,4,6(1*H*,3*H*,5*H*)-trione, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder, hygroscopic, freely soluble in carbon dioxide-free water (a small fraction may be insoluble), soluble in alcohol, practically insoluble in methylene chloride.

IDENTIFICATION

First identification: A, B, E.

Second identification: A, C, D, E.

- A. Acidify 10 ml of solution S (see Tests) with *dilute hydrochloric acid R* and shake with 20 ml of *ether R*. Separate the ether layer, wash with 10 ml of *water R*, dry over *anhydrous sodium sulphate R* and filter. Evaporate the filtrate to dryness and dry the residue at 100 °C to 105 °C. Determine the melting point (2.2.14) of the test residue. Mix equal parts of the residue and of *phenobarbital CRS* and determine the melting point of the mixture. The difference between the two melting points (which are about 176 °C) is not greater than 2 °C.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing the residue obtained during identification test A with the spectrum obtained with *phenobarbital CRS*. If the spectra obtained in the solid state show differences, dissolve the test residue and the reference substance separately in *ethanol R*, evaporate to dryness and record the spectra again.
- C. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.
Test solution. Dissolve 0.10 g of the substance to be examined in *alcohol (50 per cent V/V) R* and dilute to 100 ml with the same solvent.
Reference solution. Dissolve 90 mg of *phenobarbital CRS* in *alcohol (50 per cent V/V) R* and dilute to 100 ml with the same solvent.

01/2005:0631

Apply separately to the plate 10 µl of each solution. Develop over a path of 18 cm using the lower layer from a mixture of 5 volumes of *concentrated ammonia R*, 15 volumes of *alcohol R* and 80 volumes of *chloroform R*. Examine immediately in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

D. It gives the reaction of non-nitrogen substituted barbiturates (2.3.1).

E. It gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 5.0 g in *alcohol (50 per cent V/V) R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₇ (2.2.2, *Method II*).

pH (2.2.3). Dissolve 5.0 g as completely as possible in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent. The pH of the solution is not greater than 10.2.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 1.0 g of the substance to be examined in *alcohol (50 per cent V/V) R* and dilute to 100 ml with the same solvent.

Reference solution. Dilute 0.5 ml of the test solution to 100 ml with *alcohol (50 per cent V/V) R*.

Apply separately to the plate 20 µl of each solution. Develop over a path of 15 cm using the lower layer from a mixture of 5 volumes of *concentrated ammonia R*, 15 volumes of *alcohol R* and 80 volumes of *chloroform R*. Examine immediately in ultraviolet light at 254 nm. Spray with *diphenylcarbazone mercuric reagent R*. Allow the plate to dry in air and spray with freshly prepared *alcoholic potassium hydroxide solution R* diluted 1 in 5 with *aldehyde-free alcohol R*. Heat at 100 °C to 105 °C for 5 min and examine immediately. When examined in ultraviolet light and after spraying, any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent). Disregard any spot at the starting-point.

Loss on drying (2.2.32). Not more than 7.0 per cent, determined on 0.500 g by drying in an oven at 150 °C for 4 h.

ASSAY

Dissolve 0.150 g in 2 ml of *water R* and add 8 ml of 0.05 M *sulphuric acid*. Heat to boiling and cool. Add 30 ml of *methanol R* and shake until dissolution is complete. Carry out a potentiometric titration (2.2.20), using 0.1 M *sodium hydroxide*. After the first point of inflexion, interrupt the addition of sodium hydroxide, add 10 ml of *pyridine R*, mix and continue the titration. Read the volume added between the two points of inflexion.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 25.42 mg of C₁₂H₁₁N₂NaO₃.

STORAGE

Store in an airtight container.

PHENOL

Phenolum

C₆H₆OM_r 94.1

DEFINITION

Phenol contains not less than 99.0 per cent and not more than the equivalent of 100.5 per cent of C₆H₆O.

CHARACTERS

Colourless or faintly pink or faintly yellowish crystals or crystalline masses, deliquescent, soluble in water, very soluble in alcohol, in glycerol and in methylene chloride.

IDENTIFICATION

- Dissolve 0.5 g in 2 ml of *concentrated ammonia R*. The substance dissolves completely. Dilute to about 100 ml with *water R*. To 2 ml of the dilute solution add 0.05 ml of *strong sodium hypochlorite solution R*. A blue colour develops and becomes progressively more intense.
- To 1 ml of solution S (see Tests) add 10 ml of *water R* and 0.1 ml of *ferric chloride solution R1*. A violet colour is produced which disappears on addition of 5 ml of *2-propanol R*.
- To 1 ml of solution S add 10 ml of *water R* and 1 ml of *bromine water R*. A pale-yellow precipitate is formed.

TESTS

Solution S. Dissolve 1.0 g in *water R* and dilute to 15 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution B₆ (2.2.2, *Method II*).

Acidity. To 2 ml of solution S add 0.05 ml of *methyl orange solution R*. The solution is yellow.

Freezing point (2.2.18). Not less than 39.5 °C.

Residue on evaporation. Not more than 0.05 per cent, determined by evaporating 5.000 g to dryness on a water-bath and drying the residue at 100 °C to 105 °C for 1 h.

ASSAY

Dissolve 2.000 g in *water R* and dilute to 1000.0 ml with the same solvent. Transfer 25.0 ml of the solution to a ground-glass-stoppered flask and add 50.0 ml of 0.0167 M *bromide-bromate* and 5 ml of *hydrochloric acid R*, close the flask, allow to stand with occasional swirling for 30 min and then allow to stand for a further 15 min. Add 5 ml of a 200 g/l solution of *potassium iodide R*, shake and titrate with 0.1 M *sodium thiosulphate* until a faint yellow colour remains. Add 0.5 ml of *starch solution R* and 10 ml of *chloroform R* and continue the titration with vigorous shaking. Carry out a blank titration.

1 ml of 0.0167 M *bromide-bromate* is equivalent to 1.569 mg of C₆H₆O.

STORAGE

Store in an airtight container, protected from light.

01/2005:1584

PHENOLPHTHALEIN

Phenolphthaleinum

 $C_{20}H_{14}O_4$ M_r 318.3

DEFINITION

Phenolphthalein contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of 3,3-bis(4-hydroxyphenyl)isobenzofuran-1(3*H*)-one, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, practically insoluble in water, soluble in alcohol.

It melts at about 260 °C.

IDENTIFICATION

- A. Dissolve 25.0 mg in *alcohol R* and dilute to 100.0 ml with the same solvent (solution A). To 2.0 ml of solution A add 5.0 ml of 1 *M* hydrochloric acid and dilute to 50.0 ml with *alcohol R* (solution A₁). To 10.0 ml of solution A add 5.0 ml of 1 *M* hydrochloric acid and dilute to 50.0 ml with *alcohol R* (solution A₂). To 2.0 ml of solution A add 5.0 ml of 1 *M* sodium hydroxide and dilute to 50.0 ml with *alcohol R* (solution B). Examined between 220 nm and 250 nm (2.2.25), solution A₁ shows an absorption maximum at 229 nm. The specific absorbance at the maximum at 229 nm is 922 to 1018. Examined between 250 nm and 300 nm, solution A₂ shows an absorption maximum at 276 nm. The specific absorbance at the maximum at 276 nm is 142 to 158. Examined between 230 nm and 270 nm, solution B shows an absorption maximum at 249 nm. The specific absorbance at the maximum at 249 nm is 744 to 822.
- B. Dissolve about 10 mg in *alcohol R*. Add 1 ml of dilute sodium hydroxide solution *R*. The solution is red. Add 5 ml of dilute sulphuric acid *R*. The colour disappears.

TESTS

Solution S. To 2.0 g add 40 ml of distilled water *R* and heat to boiling. Cool and filter.

Appearance of solution. Dissolve 0.20 g in 5 ml of *alcohol R*. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₇ (2.2.2, Method II).

Acidity or alkalinity. To 10 ml of solution S add 0.15 ml of bromothymol blue solution *R1*. Add 0.05 ml of 0.01 *M* hydrochloric acid, the solution is yellow. Add 0.10 ml of 0.01 *M* sodium hydroxide, the solution is blue.

Related substances. Examine by thin-layer chromatography (2.2.27), using a TLC silica gel F₂₅₄ plate *R*.

Test solution. Dissolve 0.5 g of the substance to be examined in *alcohol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dilute 1 ml of the test solution to 10 ml with *alcohol R*. Dilute 5 ml of this solution to 100 ml with *alcohol R*.

Reference solution (b). Dissolve 25 mg of fluorene *R* in *alcohol R*, add 0.5 ml of the test solution and dilute to 10 ml with *alcohol R*.

Apply to the plate 5 µl of the test solution and 5 µl of each of the reference solutions. Develop over a path corresponding to two-thirds of the plate height using a mixture of 50 volumes of *acetone R* and 50 volumes of *methylene chloride R*. Allow the plate to dry in air. Examine in ultraviolet light at 254 nm and re-examine after exposure to ammonia vapour. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

Chlorides (2.4.4). Dilute 10 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides (100 ppm).

Sulphates (2.4.13). 15 ml of solution S complies with the limit test for sulphates (200 ppm).

Heavy metals (2.4.8). Heat 3 g with 50 ml of dilute hydrochloric acid *R* on a water-bath for 5 min and filter. Evaporate the filtrate almost to dryness and dissolve the residue in 30 ml of *water R*. 12 ml of this solution complies with limit test A for heavy metals (10 ppm). Prepare the standard using 10 ml of lead standard solution (1 ppm Pb) *R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in 5 ml of dimethylformamide *R*. Add 5 ml of sodium carbonate solution *R*, 10 ml of sodium hydrogen carbonate solution *R*, 35 ml of *water R* and 50.0 ml of 0.05 *M* iodine. Add 10 ml of *methylene chloride R* and 20 ml of dilute sulphuric acid *R*. Titrate the excess of iodine with 0.1 *M* sodium thiosulphate, using 0.3 ml of starch solution *R* added towards the end of the titration, as indicator. Carry out a blank titration.

1 ml of 0.05 *M* iodine is equivalent to 3.979 mg of C₂₀H₁₄O₄.

STORAGE

Store protected from light.

01/2005:0242

PHENOLSULFONPHTHALEIN

Phenolsulfonphthaleinum

 $C_{19}H_{14}O_5S$ M_r 354.4

DEFINITION

Phenolsulfonphthalein (phenol red) contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of 3,3-bis(4-hydroxyphenyl)-3*H*-2,1-benzoxathiole 1,1-dioxide, calculated with reference to the dried substance.

CHARACTERS

A bright-red to dark-red, crystalline powder, very slightly soluble in water, slightly soluble in alcohol.

IDENTIFICATION

- A. Dissolve 10 mg in a 10 g/l solution of *sodium carbonate R* and dilute to 200.0 ml with the sodium carbonate solution. Dilute 5.0 ml of the solution to 100.0 ml with a 10 g/l solution of *sodium carbonate R*. Examined between 400 nm and 630 nm (2.2.25), the solution shows an absorption maximum at 558 nm. The specific absorbance at the maximum is 1900 to 2100.
- B. Dissolve about 10 mg in 1 ml of *dilute sodium hydroxide solution R* and add 9 ml of *water R*. The solution is deep red. To 5 ml of the solution add a slight excess of *dilute sulphuric acid R*. The colour becomes orange.
- C. To 5 ml of the solution prepared for identification test B add 1 ml of 0.0167 M bromide-bromate and 1 ml of *dilute hydrochloric acid R*, shake and allow to stand for 15 min. Make alkaline with *dilute sodium hydroxide solution R*. An intense violet-blue colour is produced.

TESTS

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 0.1 g of the substance to be examined in 0.1 M *sodium hydroxide* and dilute to 5 ml with the same solvent.

Reference solution. Dilute 0.5 ml of the test solution to 100 ml with 0.1 M *sodium hydroxide*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 25 volumes of *glacial acetic acid R*, 25 volumes of *water R* and 100 volumes of *tert-pentyl alcohol R*. Allow the plate to dry in air until the solvent has evaporated and expose the plate to the vapour from *concentrated ammonia R*. Examine in ultraviolet light at 254 nm. Not more than one spot, apart from the principal spot, appears in the chromatogram obtained with the test solution and this spot is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Insoluble matter. To 1.0 g of the finely powdered substance to be examined add 12 ml of *sodium hydrogen carbonate solution R*. Allow to stand for 1 h, shaking frequently. Dilute to 100 ml with *water R* and allow to stand for 15 h. Centrifuge at 2000 g to 3000 g, for 30 min, decant the supernatant liquid and wash the residue with 25 ml of a 10 g/l solution of *sodium hydrogen carbonate R* and then 25 ml of *water R*. Dry at 100 °C to 105 °C. The residue weighs not more than 5 mg (0.5 per cent).

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.00 g of the powdered substance to be examined by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.2 per cent, determined on 0.5 g.

ASSAY

Dissolve 0.900 g in 15 ml of 1 M *sodium hydroxide* and dilute to 250.0 ml with *water R*. To 10.0 ml of the solution in a glass-stoppered flask add 25 ml of *glacial acetic acid R*, 20.0 ml of 0.0167 M *potassium bromate*, 5 ml of a 100 g/l solution of *potassium bromide R* and 5 ml of *hydrochloric acid R*. Allow to stand protected from light for 15 min, add 10 ml of a 100 g/l solution of *potassium iodide R* and titrate immediately with 0.1 M *sodium thiosulphate*, using 0.1 ml of *starch solution R* as indicator.

1 ml of 0.0167 M *potassium bromate* is equivalent to 4.43 mg of C₈H₁₀O₂S.

01/2005:0781

PHENOXYETHANOL

Phenoxyethanolum

C₈H₁₀O₂M_r 138.2

DEFINITION

Phenoxyethanol contains not less than 99.0 per cent and not more than the equivalent of 100.5 per cent *m/m* of 2-phenoxyethanol.

CHARACTERS

A colourless, slightly viscous liquid, slightly soluble in water, miscible with acetone, with alcohol and with glycerol, slightly soluble in arachis oil and in olive oil.

IDENTIFICATION

First identification: C.

Second identification: A, B, D.

- A. Refractive index (2.2.6): 1.537 to 1.539.
- B. Dissolve 80.0 mg in *water R* and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml of the solution to 100.0 ml with *water R*. Examined between 240 nm and 350 nm (2.2.25), the solution shows two absorption maxima, at 269 nm and at 275 nm. The specific absorbances at the maxima are 95 to 105 and 75 to 85 respectively.
- C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *phenoxyethanol CRS*.
- D. Shake 2 ml with a mixture of 4 g of *potassium permanganate R*, 5.4 g of *sodium carbonate R* and 75 ml of *water R* for 30 min. Add 25 g of *sodium chloride R* and stir continuously for 60 min, filter and acidify with *hydrochloric acid R* to about pH 1.7. The melting point of the precipitate, after recrystallisation from *water R*, is 96 °C to 99 °C (2.2.14).

TESTS

Relative density (2.2.5): 1.105 to 1.110.

Related substances. Examine by gas chromatography (2.2.28), using *methyl laurate R* as internal standard.

Internal standard solution. Dissolve 1.25 g of *methyl laurate R* in *methylene chloride R* and dilute to 25 ml with the same solvent.

Test solution (a). Dissolve 5.0 g of the substance to be examined in *methylene chloride R* and dilute to 10.0 ml with the same solvent.

Test solution (b). Dissolve 5.0 g of the substance to be examined in *methylene chloride R*, add 1.0 ml of the internal standard solution and dilute to 10.0 ml with *methylene chloride R*.

Reference solution. To 1.0 ml of test solution (a), add 10.0 ml of the internal standard solution and dilute to 100.0 ml with *methylene chloride R*.

The chromatographic procedure may be carried out using:

01/2005:0148
corrected

- a glass column 1.5 m long and 4 mm in internal diameter packed with *silanised diatomaceous earth for gas chromatography R* (150 µm to 180 µm) impregnated with 3 per cent *m/m* of *polymethylphenylsiloxane R*,
- *nitrogen for chromatography R* as the carrier gas at a flow rate of 30 ml/min,
- a flame-ionisation detector,

maintaining the temperature of the column at 130 °C and that of the injection port and of the detector at 200 °C.

Inject 1 µl of the reference solution and adjust the sensitivity of the detector so that the heights of the two peaks, apart from the solvent peak, are not less than 70 per cent of the full scale of the recorder. The substances elute in the following order: phenoxyethanol and methyl laurate. The test is not valid unless, in the chromatogram obtained with the reference solution, the resolution between the peaks corresponding to phenoxyethanol and methyl laurate is not less than twelve.

Inject 1 µl of test solution (a). In the chromatogram obtained, verify that there is no peak with the same retention time as the internal standard.

Inject separately 1 µl of test solution (b) and the reference solution. Continue the chromatography for five times the retention time of phenoxyethanol (which is about 5 min). From the chromatogram obtained with the reference solution, calculate the ratio (*R*) of the area of the peak due to phenoxyethanol to the area of the peak due to the internal standard. From the chromatogram obtained with test solution (b), calculate the ratio of the sum of the areas of any peaks, apart from the principal peak, the peak due to the internal standard and the peak due to the solvent, to the area of the peak due to the internal standard: this ratio is not greater than *R* (1.0 per cent).

Phenol. Dissolve 1.00 g in 50 ml of *methylene chloride R*, add 1 ml of *dilute sodium hydroxide solution R* and 10 ml of *water R*. Shake. Wash the upper layer with two quantities, each of 20 ml, of *methylene chloride R* and dilute to 100.0 ml with *water R*. The absorbance (2.2.25) of the resulting solution at the maximum at 287 nm is not more than 0.27 (0.1 per cent).

ASSAY

To 2.000 g in an acetylation flask fitted with an air condenser, add 10.0 ml of freshly prepared *acetic anhydride solution R1* and heat with frequent shaking in a water-bath for 45 min. Cool and carefully add 10 ml of *water R*. Heat for a further 2 min. Cool, add 10 ml of *butanol R*, shake vigorously and titrate the excess of acetic acid with 1 M *sodium hydroxide* using 0.2 ml of *phenolphthalein solution R* as indicator. Repeat the procedure without the substance to be examined. The difference between the volumes used in the titrations represents the amount of acetic anhydride required for the acetylation of the substance to be examined.

1 ml of 1 M *sodium hydroxide* is equivalent to 0.1382 g of C₈H₁₀O₂.

PHENOXYMETHYLPENICILLIN

Phenoxyethylpenicillinum

C₁₆H₁₈N₂O₅S

M_r 350.4

DEFINITION

Phenoxyethylpenicillin is (2*S*,5*R*,6*R*)-3,3-dimethyl-7-oxo-6-[(phenoxyacetyl)amino]-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, a substance produced by the growth of certain strains of *Penicillium notatum* or related organisms on a culture medium containing an appropriate precursor, or obtained by any other means. The sum of the percentage contents of phenoxyethylpenicillin and 4-hydroxyphenoxyethylpenicillin is not less than 95.0 per cent and not more than the equivalent of 100.5 per cent, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, slightly hygroscopic, very slightly soluble in water, soluble in alcohol.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

A. It complies with the test for pH (see Tests).

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *phenoxyethylpenicillin CRS*.

C. Examine by thin-layer chromatography (2.2.27), using *silanised silica gel H R* as the coating substance.

Test solution. Dissolve 25 mg of the substance to be examined in 5 ml of *acetone R*.

Reference solution (a). Dissolve 25 mg of *phenoxyethylpenicillin CRS* in 5 ml of *acetone R*.

Reference solution (b). Dissolve 25 mg of *benzylpenicillin potassium CRS* and 25 mg of *phenoxyethylpenicillin potassium CRS* in 5 ml of *water R*.

Apply to the plate 1 µl of each solution. Develop over a path of 15 cm using a mixture of 30 volumes of *acetone R* and 70 volumes of a 154 g/l solution of *ammonium acetate R*, adjusted to pH 5.0 with *glacial acetic acid R*. Allow the plate to dry in air and expose it to iodine vapour until the spots appear. Examine in daylight. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

D. Place about 2 mg in a test-tube about 150 mm long and 15 mm in diameter. Moisten with 0.05 ml of *water R* and add 2 ml of *sulphuric acid-formaldehyde reagent R*. Mix the contents of the tube by swirling; the solution is reddish-brown. Place the test-tube on a water-bath for 1 min; a dark reddish-brown colour develops.

TESTS

pH (2.2.3). Suspend 50 mg in 10 ml of *carbon dioxide-free water R*. The pH of the suspension is 2.4 to 4.0.

Specific optical rotation (2.2.7). Dissolve 0.250 g in *butanol R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 186 to + 200, calculated with reference to the anhydrous substance.

Related substances. Examine by liquid chromatography (2.2.29) as described under Assay. Inject 20 µl of reference solution (d) and elute isocratically with the chosen mobile phase until elution of the phenoxymethylpenicillin peak. Adjust the sensitivity of the system to obtain a peak with a signal-to-noise ratio of at least 3. Inject 20 µl of reference solution (e). Inject 20 µl of test solution (b) and start the elution isocratically. Immediately after elution of the phenoxymethylpenicillin peak start the following linear gradient.

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 20	60 → 0	40 → 100	linear gradient
20 - 35	0	100	isocratic
35 - 50	0 → 60	100 → 40	re-equilibration

Inject the dissolution mixture and use the same elution pattern to obtain a blank. In the chromatogram obtained with test solution (b), the area of any peak, apart from the principal peak and any peak corresponding to 4-hydroxyphenoxymethylpenicillin, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (e) (1 per cent).

4-Hydroxyphenoxymethylpenicillin. Not more than 4.0 per cent, calculated with reference to the anhydrous substance and determined by liquid chromatography (2.2.29), as described under Assay.

Water (2.5.12). Not more than 0.5 per cent, determined on 1.000 g by the semi-micro determination of water.

ASSAY

Examine by liquid chromatography (2.2.29).

Dissolution mixture. To 250 ml of 0.2 M *potassium dihydrogen phosphate R* add 500 ml of *water R* and adjust to pH 6.5 with an 8.4 g/l solution of *sodium hydroxide R*. Dilute to 1000 ml with *water R*.

Test solution (a). Dissolve 50.0 mg of the substance to be examined in the dissolution mixture and dilute to 50.0 ml with the same mixture.

Test solution (b). Prepare immediately before use. Dissolve 80.0 mg of the substance to be examined in the dissolution mixture and dilute to 20.0 ml with the same mixture.

Reference solution (a). Dissolve 55.0 mg of *phenoxymethylpenicillin potassium CRS* in the dissolution mixture and dilute to 50.0 ml with the same mixture.

Reference solution (b). Dissolve 10.0 mg of *4-hydroxyphenoxymethylpenicillin CRS* in the dissolution mixture and dilute to 25.0 ml with the same mixture. Dilute 5.0 ml of the solution to 100.0 ml with the dissolution mixture.

Reference solution (c). Dissolve 10 mg of *phenoxymethylpenicillin potassium CRS* and 10 mg of *benzylpenicillin sodium CRS* in the dissolution mixture and dilute to 50 ml with the same mixture.

Reference solution (d). Dilute 1.0 ml of reference solution (a) to 20 ml with the dissolution mixture. Dilute 1.0 ml of the solution to 50 ml with the dissolution mixture.

Reference solution (e). Dilute 1.0 ml of reference solution (a) to 25.0 ml with the dissolution mixture.

The chromatographic procedure may be carried out using:

- a column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),

- as mobile phase at a flow rate of 1.0 ml/min:

Mobile phase A. Mix 10 volumes of *phosphate buffer solution pH 3.5 R*, 30 volumes of *methanol R* and 60 volumes of *water R*,

Mobile phase B. Mix 10 volumes of *phosphate buffer solution pH 3.5 R*, 35 volumes of *water R* and 55 volumes of *methanol R*,

- as detector a spectrophotometer set at 254 nm.

Equilibrate the column with a mobile phase ratio A:B of 60:40. Inject 20 µl of reference solution (c). The test is not valid unless, in the chromatogram obtained, the resolution between the 2 principal peaks is at least 6.0 (if necessary, adjust the ratio A:B of the mobile phase) and the mass distribution ratio for the second peak (phenoxymethylpenicillin) is 5.0 to 7.0. Inject reference solution (a) 6 times. The test is not valid unless the relative standard deviation for the area of the principal peak is at most 1.0 per cent. Inject alternately test solution (a) and reference solutions (a) and (b).

Calculate the percentage content of phenoxymethylpenicillin by multiplying the percentage content of phenoxymethylpenicillin potassium by 0.902. Calculate the percentage content of 4-hydroxyphenoxymethylpenicillin by multiplying if necessary by the correction factor supplied with the CRS.

STORAGE

Store in an airtight container.

IMPURITIES

A. benzylpenicillin,

B. phenoxyacetic acid,

C. (2*S*,5*R*,6*R*)-6-amino-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (6-aminopenicillanic acid),

D. (2*S*,5*R*,6*R*)-3,3-dimethyl-7-oxo-6-[[2-(4-hydroxyphenoxy)acetyl]amino]-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (4-hydroxyphenoxymethylpenicillin),

- E. R = CO₂H: (4*S*)-2-[carboxy[(phenoxyacetyl)amino]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid (penicilloic acids of phenoxymethylpenicillin),
- F. R = H: (2*RS*,4*S*)-5,5-dimethyl-2-[(phenoxyacetyl)amino]methylthiazolidine-4-carboxylic acid (penilloic acids of phenoxymethylpenicillin).

corrected

PHENOXYMETHYLPENICILLIN POTASSIUM

Phenoxymethylpenicillinum kalicum

C₁₆H₁₇KN₂O₅S

*M*_r 388.5

DEFINITION

Phenoxymethylpenicillin potassium is the potassium salt of (2*S*,5*R*,6*R*)-3,3-dimethyl-7-oxo-6-[(phenoxyacetyl)amino]-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, a substance produced by the growth of certain strains of *Penicillium notatum* or related organisms on a culture medium containing an appropriate precursor, or obtained by any other means. The sum of the percentage contents of phenoxymethylpenicillin potassium and 4-hydroxyphenoxymethylpenicillin potassium is not less than 95.0 per cent and not more than the equivalent of 100.5 per cent, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, freely soluble in water, practically insoluble in alcohol.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *phenoxymethylpenicillin potassium CRS*.
- B. Examine by thin-layer chromatography (2.2.27), using *silanised silica gel H R* as the coating substance.
Test solution. Dissolve 25 mg of the substance to be examined in 5 ml of *water R*.
Reference solution (a). Dissolve 25 mg of *phenoxymethylpenicillin potassium CRS* in 5 ml of *water R*.

Reference solution (b). Dissolve 25 mg of *benzylpenicillin potassium CRS* and 25 mg of *phenoxymethylpenicillin potassium CRS* in 5 ml of *water R*.

Apply to the plate 1 µl of each solution. Develop over a path of 15 cm using a mixture of 30 volumes of *acetone R* and 70 volumes of a 154 g/l solution of *ammonium*

acetate R, adjusted to pH 5.0 with *glacial acetic acid R*. Allow the plate to dry in air and expose it to iodine vapour until the spots appear. Examine in daylight. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

- C. Place about 2 mg in a test-tube about 150 mm long and 15 mm in diameter. Moisten with 0.05 ml of *water R* and add 2 ml of *sulphuric acid-formaldehyde reagent R*. Mix the contents of the tube by swirling; the solution is reddish-brown. Place the test-tube in a water-bath for 1 min; a dark reddish-brown colour develops.
- D. It gives reaction (a) of potassium (2.3.1).

TESTS

pH (2.2.3). Dissolve 50 mg in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent. The pH of the solution is 5.5 to 7.5.

Specific optical rotation (2.2.7). Dissolve 0.250 g in *carbon dioxide-free water R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 215 to + 230, calculated with reference to the anhydrous substance.

Related substances. Examine by liquid chromatography (2.2.29) as described under Assay. Inject 20 µl of reference solution (d) and elute isocratically with the chosen mobile phase until elution of the phenoxymethylpenicillin peak. Adjust the sensitivity of the system to obtain a peak with a signal-to-noise ratio of at least 3. Inject 20 µl of reference solution (e). Inject 20 µl of test solution (b) and start the elution isocratically. Immediately after elution of the phenoxymethylpenicillin peak start the following linear gradient.

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 20	60 → 0	40 → 100	linear gradient
20 - 35	0	100	isocratic
35 - 50	0 → 60	100 → 40	re-equilibration

Inject the dissolution mixture and use the same elution pattern to obtain a blank. In the chromatogram obtained with test solution (b), the area of any peak, apart from the principal peak and any peak corresponding to 4-hydroxyphenoxymethylpenicillin, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (e) (1 per cent).

4-Hydroxyphenoxymethylpenicillin potassium. Not more than 4.0 per cent, calculated with reference to the anhydrous substance and determined by liquid chromatography (2.2.29), as described under Assay.

Water (2.5.12). Not more than 1.0 per cent, determined on 1.000 g by the semi-micro determination of water.

ASSAY

Examine by liquid chromatography (2.2.29).

Dissolution mixture. To 250 ml of 0.2 M *potassium dihydrogen phosphate R* add 500 ml of *water R* and adjust to pH 6.5 with an 8.4 g/l solution of *sodium hydroxide R*. Dilute to 1000 ml with *water R*.

Test solution (a). Dissolve 50.0 mg of the substance to be examined in the dissolution mixture and dilute to 50.0 ml with the same mixture.

Test solution (b). Prepare immediately before use. Dissolve 80.0 mg of the substance to be examined in the dissolution mixture and dilute to 20.0 ml with the same mixture.

Reference solution (a). Dissolve 50.0 mg of *phenoxymethylpenicillin potassium CRS* in the dissolution mixture and dilute to 50.0 ml with the same mixture.

Reference solution (b). Dissolve 10.0 mg of *4-hydroxyphenoxymethylpenicillin CRS* in the dissolution mixture and dilute to 25.0 ml with the same mixture. Dilute 5.0 ml of the solution to 100.0 ml with the dissolution mixture.

Reference solution (c). Dissolve 10 mg of *phenoxymethylpenicillin potassium CRS* and 10 mg of *benzylpenicillin sodium CRS* in the dissolution mixture and dilute to 50 ml with the same mixture.

Reference solution (d). Dilute 1.0 ml of reference solution (a) to 20 ml with the dissolution mixture. Dilute 1.0 ml of the solution to 50 ml with the dissolution mixture.

Reference solution (e). Dilute 1.0 ml of reference solution (a) to 25.0 ml with the dissolution mixture.

The chromatographic procedure may be carried out using:

- a column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),

- as mobile phase at a flow rate of 1.0 ml/min:

Mobile phase A. Mix 10 volumes of *phosphate buffer solution pH 3.5 R*, 30 volumes of *methanol R* and 60 volumes of *water R*,

Mobile phase B. Mix 10 volumes of *phosphate buffer solution pH 3.5 R*, 35 volumes of *water R* and 55 volumes of *methanol R*,

- as detector a spectrophotometer set at 254 nm.

Equilibrate the column with a mobile phase ratio A:B of 60:40. Inject 20 µl of reference solution (c). The test is not valid unless, in the chromatogram obtained, the resolution between the 2 principal peaks is at least 6.0 (if necessary, adjust the ratio A:B of the mobile phase) and the mass distribution ratio for the second peak (phenoxymethylpenicillin) is 5.0 to 7.0. Inject reference solution (a) 6 times. The test is not valid unless the relative standard deviation for the area of the principal peak is at most 1.0 per cent. Inject alternately test solution (a) and reference solutions (a) and (b).

Calculate the percentage content of phenoxymethylpenicillin potassium. Calculate the percentage content of 4-hydroxyphenoxymethylpenicillin potassium by multiplying the percentage content of 4-hydroxyphenoxymethylpenicillin if necessary by the correction factor supplied with the CRS.

IMPURITIES

A. benzylpenicillin,

B. phenoxyacetic acid,

C. (2*S*,5*R*,6*R*)-6-amino-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (6-aminopenicillanic acid),

D. (2*S*,5*R*,6*R*)-3,3-dimethyl-7-oxo-6-[[2-(4-hydroxyphenoxy)acetyl]amino]-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (4-hydroxyphenoxymethylpenicillin),

E. R = CO₂H: (4*S*)-2-[carboxy[(phenoxyacetyl)amino]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid (penicilloic acids of phenoxymethylpenicillin),

F. R = H: (2*R**S*,4*S*)-5,5-dimethyl-2-[[2-(phenoxyacetyl)amino]methyl]thiazolidine-4-carboxylic acid (penilloic acids of phenoxymethylpenicillin).

01/2005:1138

PHENTOLAMINE MESILATE

Phentolamini mesilas

C₁₈H₂₃N₃O₄S

M_r 377.5

DEFINITION

Phentolamine mesilate contains not less than 98.0 per cent and not more than the equivalent of 100.5 per cent of 3-[[4-(4,5-dihydro-1*H*-imidazol-2-yl)methyl](4-methylphenyl)amino]phenol methanesulphonate, calculated with reference to the dried substance.

PRODUCTION

The production method must be evaluated to determine the potential for formation of alkyl mesilates, which is particularly likely to occur if the reaction medium contains lower alcohols. Where necessary, the production method is validated to demonstrate that alkyl mesilates are not detectable in the final product.

CHARACTERS

A white, crystalline powder, slightly hygroscopic, freely soluble in water and in alcohol, practically insoluble in methylene chloride.

IDENTIFICATION

First identification: C, E

Second identification: A, B, D, E.

- A. Melting point (2.2.14): 178 °C to 182 °C.
- B. Dissolve 60.0 mg in *water R* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of the solution to 100.0 ml with *water R*. Examined between 230 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 278 nm. The specific absorbance at the maximum is 220 to 245.
- C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of phentolamine mesilate*.
- D. Dissolve 0.5 g in a mixture of 5 ml of *alcohol R* and 5 ml of a 10 g/l solution of *hydrochloric acid R* and add 0.5 ml of a 5 g/l solution of *ammonium vanadate R*. A light green precipitate is produced.
- E. Mix 50 mg with 0.2 g of *sodium hydroxide R*, heat to fusion and continue heating for a few seconds. Allow to cool and add 0.5 ml of warm *water R*. Acidify with *dilute hydrochloric acid R* and heat. Sulphur dioxide is evolved, which turns moistened *starch iodate paper R* blue.

TESTS

Acidity. Dissolve 0.1 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent. Add 0.1 ml of *methyl red solution R*. If the solution is red, not more than 0.05 ml of 0.1 M *sodium hydroxide* is required to change the colour of the indicator to yellow.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. Dissolve 0.10 g of the substance to be examined in *alcohol R* and dilute to 5 ml with the same solvent.

Reference solution (a). Dilute 0.5 ml of the test solution to 100 ml with *alcohol R*.

Reference solution (b). Dilute 5 ml of reference solution (a) to 10 ml with *alcohol R*.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 5 volumes of *concentrated ammonia R*, 15 volumes of *acetone R* and 85 volumes of *methyl ethyl ketone R*. Allow the plate to dry in air and spray with *dilute potassium iodobismuthate solution R*. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent) and at most one such spot is more intense than the spot in the chromatogram obtained with reference solution (b) (0.25 per cent).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 100 ml of *2-propanol R1*. Titrate under a current of nitrogen with 0.1 M *tetrabutylammonium hydroxide in 2-propanol*. Determine the end-point potentiometrically (2.2.20), using a glass electrode as indicator electrode and a calomel electrode containing a saturated solution of *tetramethylammonium chloride R* in *2-propanol R1* as the comparison electrode. Carry out a blank titration.

1 ml of 0.1 M *tetrabutylammonium hydroxide in 2-propanol* is equivalent to 37.75 mg of $C_{18}H_{23}N_3O_4S$.

STORAGE

In an airtight container, protected from light.

IMPURITIES

A. *N*-(2-aminoethyl)-2-[(3-hydroxyphenyl)(4-methylphenyl)amino]acetamide.

01/2005:0782

PHENYLALANINE

Phenylalaninum

$C_9H_{11}NO_2$

M_r 165.2

DEFINITION

Phenylalanine contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (S)-2-amino-3-phenylpropanoic acid, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, or shiny, white flakes, sparingly soluble in water, very slightly soluble in alcohol. It dissolves in dilute mineral acids and in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

- A. It complies with the test for specific optical rotation (see Tests).
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *phenylalanine CRS*. Examine the substances prepared as discs.
- C. Examine the chromatograms obtained in the test for ninhydrin-positive substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- D. To about 10 mg add 0.5 g of *potassium nitrate R* and 2 ml of *sulphuric acid R*. Heat on a water-bath for 20 min. Allow to cool. Add 5 ml of a 50 g/l solution of *hydroxylamine hydrochloride R* and allow to stand in iced water for 10 min. Add 9 ml of *strong sodium hydroxide solution R*. A violet-red to violet-brown colour develops.

TESTS

Appearance of solution. Dissolve 0.5 g in 1 M *hydrochloric acid* and dilute to 10 ml with the same acid. The solution is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, *Method II*).

Specific optical rotation (2.2.7). Dissolve 0.50 g in *water R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is -33.0 to -35.5 , calculated with reference to the dried substance.

Ninhydrin-positive substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution (a). Dissolve 0.10 g of the substance to be examined in a mixture of equal volumes of *glacial acetic acid R* and *water R* and dilute to 10 ml with the same mixture of solvents.

Test solution (b). Dilute 1 ml of test solution (a) to 50 ml with a mixture of equal volumes of *glacial acetic acid R* and *water R*.

Reference solution (a). Dissolve 10 mg of *phenylalanine CRS* in a mixture of equal volumes of *glacial acetic acid R* and *water R* and dilute to 50 ml with the same mixture of solvents.

Reference solution (b). Dilute 5 ml of test solution (b) to 20 ml with a mixture of equal volumes of *glacial acetic acid R* and *water R*.

Reference solution (c). Dissolve 10 mg of *phenylalanine CRS* and 10 mg of *tyrosine CRS* in a mixture of equal volumes of *glacial acetic acid R* and *water R* and dilute to 25 ml with the same mixture of solvents.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of *glacial acetic acid R*, 20 volumes of *water R* and 60 volumes of *butanol R*. Allow the plate to dry in air, spray with *ninhydrin solution R* and heat at 100 °C to 105 °C for 15 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Chlorides (2.4.4). Dissolve 0.25 g in 3 ml of *dilute nitric acid R* and dilute to 15 ml with *water R*. The solution complies with the limit test for chlorides, without any further addition of nitric acid (200 ppm).

Sulphates (2.4.13). Dissolve 0.5 g in a mixture of 5 volumes of *dilute hydrochloric acid R* and 25 volumes of *distilled water R* and dilute to 15 ml with the same mixture of solvents. The solution complies with the limit test for sulphates (300 ppm).

Ammonium (2.4.1). 50 mg complies with limit test B for ammonium (200 ppm). Prepare the standard using 0.1 ml of *ammonium standard solution* (100 ppm NH_4) *R*.

Iron (2.4.9). In a separating funnel, dissolve 1.0 g in 10 ml of *dilute hydrochloric acid R*. Shake with three quantities, each of 10 ml, of *methyl isobutyl ketone RI*, shaking for 3 min each time. To the combined organic layers add 10 ml of *water R* and shake for 3 min. The aqueous layer complies with the limit test for iron (10 ppm).

Heavy metals (2.4.8). 2.0 g complies with limit test D for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution* (10 ppm *Pb*) *R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in 3 ml of *anhydrous formic acid R*. Add 30 ml of *anhydrous acetic acid R*. Titrate with 0.1 *M perchloric acid* using 0.1 ml of *naphtholbenzein solution R* as indicator, until the colour changes from yellow to green. 1 ml of 0.1 *M perchloric acid* is equivalent to 16.52 mg of $\text{C}_{19}\text{H}_{20}\text{N}_2\text{O}_2$.

STORAGE

Store protected from light.

01/2005:0422

PHENYLBUTAZONE

Phenylbutazonum

$\text{C}_{19}\text{H}_{20}\text{N}_2\text{O}_2$

M_r 308.4

DEFINITION

4-Butyl-1,2-diphenylpyrazolidine-3,5-dione.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water, sparingly soluble in alcohol. It dissolves in alkaline solutions.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D.

A. Melting point (2.2.14): 104 °C to 107 °C.

B. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 25 mg of the substance to be examined in a mixture of equal volumes of *ethanol R* and *methylene chloride R* and dilute to 25 ml with the same mixture of solvents.

Reference solution. Dissolve 25 mg of *phenylbutazone CRS* in a mixture of equal volumes of *ethanol R* and *methylene chloride R* and dilute to 25 ml with the same mixture of solvents.

Plate: *TLC silica gel GF₂₅₄ plate R*.

Mobile phase: *acetone R*, *methylene chloride R* (20:80 V/V).

Application: 5 µl.

Development: over a path of 10 cm.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

C. Infrared absorption spectrophotometry (2.2.24).

Comparison: *phenylbutazone CRS*.

D. To 0.1 g add 1 ml of *glacial acetic acid R* and 2 ml of *hydrochloric acid R* and heat the mixture under a reflux condenser for 30 min. Cool, add 10 ml of *water R* and filter. To the filtrate add 3 ml of a 7 g/l solution of

sodium nitrite R. A yellow colour is produced. To 1 ml of the solution add a solution of 10 mg of *β-naphthol R* in 5 ml of *sodium carbonate solution R*. A brownish-red to violet-red precipitate is formed.

TESTS

Solution S. Dissolve 1.0 g with shaking in 20 ml of *dilute sodium hydroxide solution R* and maintain the solution at 25 °C for 3 h.

Appearance of solution. Solution S is clear (2.2.1).

Acidity or alkalinity. Heat to boiling 1.0 g in 50 ml of *water R*, cool with shaking in a closed flask and filter. To 25 ml of the filtrate add 0.5 ml of *phenolphthalein solution R*. The solution is colourless. Not more than 0.5 ml of 0.01 M *sodium hydroxide* is required to change the colour of the indicator. Add 0.6 ml of 0.01 M *hydrochloric acid* and 0.1 ml of *methyl red solution R*; the solution is red or orange.

Absorbance (2.2.25): maximum 0.20 for solution S at 420 nm in a 4 cm cell.

Related substances. Liquid chromatography (2.2.29). Prepare the solutions immediately before use.

Test solution. Dissolve 100.0 mg of the substance to be examined in *acetonitrile R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *acetonitrile R*. Dilute 1.0 ml to 10.0 ml with *acetonitrile R*.

Reference solution (b). Dissolve 5 mg of *phenylbutazone impurity B CRS* and 5 mg of *1,2-diphenylhydrazine R* in *acetonitrile R*, add 0.5 ml of the test solution and dilute to 50 ml with *acetonitrile R*. Dilute 2.5 ml to 10 ml with *acetonitrile R*.

Reference solution (c). Dissolve 1.0 mg of *benzidine R* in *acetonitrile R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml to 100.0 ml with *acetonitrile R*. Dilute 5.0 ml to 10.0 ml with *acetonitrile R*.

Column:

- **size:** $l = 0.125$ m, $\varnothing = 4.0$ mm,
- **stationary phase:** *octadecylsilyl silica gel for chromatography R* (5 μ m),
- **temperature:** 30 °C.

Mobile phase:

- **mobile phase A:** dissolve 1.36 g of *sodium acetate R* in *water R*, adjust to pH 5.2 with a 52.5 g/l solution of *citric acid R* and dilute to 1000 ml with *water R*,
- **mobile phase B:** *acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 10	70	30
10 - 20	70 → 40	30 → 60
20 - 35	40	60
35 - 40	40 → 70	60 → 30

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 240 nm.

Injection: 20 μ l; inject the test solution and reference solutions (a) and (b).

Relative retentions with reference to phenylbutazone (retention time = about 13 min): impurity E = about 0.2; impurity A = about 0.5; impurity B = about 1.2; impurity C = about 1.3; impurity D = about 1.7.

System suitability: reference solution (b):

- **resolution:** minimum 2.0 between the peaks due to phenylbutazone and to impurity B.

Limits:

- **correction factor:** for the calculation of content, multiply the peak area of impurity C by 0.55,
- **impurities A, B:** for each impurity, not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.25 per cent),
- **impurity C:** not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.20 per cent),
- **any other impurity:** not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- **total:** not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- **disregard limit:** 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.025 per cent); disregard any peak due to impurity E.

Impurity E. Liquid chromatography (2.2.29) as described in the test for related substances with the following modifications.

Detection: spectrophotometer at 280 nm.

Injection: test solution and reference solution (c).

System suitability: reference solution (c):

- **signal-to-noise ratio:** minimum 10 for the principal peak.

Limit:

- **impurity E:** not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (5 ppm).

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32): maximum 0.2 per cent, determined on 1.000 g by drying *in vacuo* at 80 °C for 4 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 25 ml of *acetone R* and add 0.5 ml of *bromothymol blue solution R1*. Titrate with 0.1 M *sodium hydroxide* until a blue colour is obtained which persists for 15 s. Carry out a blank titration.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 30.84 mg of $C_{19}H_{20}N_2O_2$.

STORAGE

Protected from light.

IMPURITIES

A. (2*RS*)-2-[(1,2-diphenyldiazanyl)carbonyl]hexanoic acid,

B. 4-butyl-4-hydroxy-1,2-diphenylpyrazolidine-3,5-dione,

C. $\text{C}_6\text{H}_5\text{-NH-NH-C}_6\text{H}_5$: 1,2-diphenyldiazane,
(1,2-diphenylhydrazine),

D. $\text{C}_6\text{H}_5\text{-N=N-C}_6\text{H}_5$: 1,2-diphenyldiazene,

E. biphenyl-4,4'-diamine (benzidine).

01/2005:1035

PHENYLEPHRINE

Phenylephrinum

$\text{C}_9\text{H}_{13}\text{NO}_2$

M_r 167.2

DEFINITION

Phenylephrine contains not less than 99.0 per cent and not more than the equivalent of 100.5 per cent of (1*R*)-1-(3-hydroxyphenyl)-2-(methylamino)ethanol, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, slightly soluble in water, sparingly soluble in methanol, slightly soluble in alcohol. It dissolves in dilute mineral acids and in dilute solutions of alkali hydroxides.

It melts at about 174 °C.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

- It complies with the test for specific optical rotation (see Tests).
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *phenylephrine CRS*.
- Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Dissolve about 10 mg in 1 ml of 1 *M* hydrochloric acid, add 0.05 ml of copper sulphate solution *R* and 1 ml of a 200 g/l solution of sodium hydroxide *R*. A violet colour develops. Add 1 ml of ether *R* and shake. The upper layer remains colourless.

TESTS

Appearance of solution. Dissolve 1 g in 1 *M* hydrochloric acid and dilute to 10 ml with the same acid. The solution is clear (2.2.1) and not more intensely coloured than reference solution *Y*₇ (2.2.2, *Method II*).

Specific optical rotation (2.2.7). Dissolve 1.250 g in 1 *M* hydrochloric acid and dilute to 25.0 ml with the same acid. The specific optical rotation is −53 to −57, calculated with reference to the dried substance.

Absorbance. Dissolve 0.50 g in 0.1 *M* hydrochloric acid and dilute to 200 ml with the same solvent. Measure the absorbance (2.2.25) at 315 nm using 0.1 *M* hydrochloric acid as the compensation liquid. The absorbance is not more than 0.15 (0.4 per cent, calculated as impurity C).

Related substances. Examine by thin-layer chromatography (2.2.27), using silica gel *HF*₂₅₄ *R* as the coating substance.

Solvent mixture. Prepare a mixture of equal volumes of methylene chloride *R* and methanolic hydrochloric acid hydrochloric acid *R* diluted to 10 volumes with methanol *R*.

Test solution. Dissolve 0.1 g of the substance to be examined in the solvent mixture and dilute to 5 ml with the same solvent mixture.

Reference solution (a). Dissolve 20 mg of *phenylephrine CRS* in the solvent mixture and dilute to 1 ml with the same solvent mixture.

Reference solution (b). Dilute 0.1 ml of the test solution to 20 ml with the solvent mixture.

Reference solution (c). Dilute 0.1 ml of the test solution to 50 ml with the solvent mixture.

Apply separately to the plate 10 µl of each solution and develop over a path of 15 cm using a mixture of 0.5 volumes of concentrated ammonia *R*, 25 volumes of methanol *R* and 70 volumes of methylene chloride *R*. Dry the plate in a current of cold air. Examine in ultraviolet light at 254 nm. Spray with a 1 g/l solution of fast red B salt *R* in a 50 g/l solution of sodium carbonate *R* and examine in daylight. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent) and at most two such spots are more intense than the spot in the chromatogram obtained with reference solution (c) (0.2 per cent).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in 60 ml of anhydrous acetic acid *R*. Titrate with 0.1 *M* perchloric acid determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 *M* perchloric acid is equivalent to 16.72 mg of $\text{C}_9\text{H}_{13}\text{NO}_2$.

STORAGE

Store in an airtight container, protected from light.

IMPURITIES

A. R = C₆H₅: 2-(benzylamino)-1-(3-hydroxyphenyl)ethanone,

C. R = H: 1-(3-hydroxyphenyl)-2-(methylamino)ethanone,

B. (1S)-1-(3-hydroxyphenyl)-2-(methylamino)ethanol.

01/2005:0632

PHENYLEPHRINE HYDROCHLORIDE

Phenylephrini hydrochloridum

C₉H₁₄ClNO₂

M_r 203.7

DEFINITION

Phenylephrine hydrochloride contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (1R)-1-(3-hydroxyphenyl)-2-(methylamino)ethanol hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, freely soluble in water and in alcohol.

It melts at about 143 °C.

IDENTIFICATION

First identification: A, B, E.

Second identification: A, C, D, E.

- It complies with the test for specific optical rotation (see Tests).
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *phenylephrine hydrochloride CRS*. Examine the substances prepared as discs.
- Dissolve 0.3 g in 3 ml of *water R*, add 1 ml of *dilute ammonia R1* and initiate crystallisation by scratching the wall of the tube with a glass rod. The crystals, washed with iced *water R* and dried at 105 °C for 2 h, melt (2.2.14) at 171 °C to 176 °C.
- Dissolve about 10 mg in 1 ml of *water R* and add 0.05 ml of a 125 g/l solution of *copper sulphate R* and 1 ml of a 200 g/l solution of *sodium hydroxide R*. A violet colour is produced. Add 1 ml of *ether R* and shake; the ether layer remains colourless.
- It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 2.00 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *methyl red solution R* and 0.2 ml of 0.01 M *sodium hydroxide*. The solution is yellow. Not more than 0.4 ml of 0.01 M *hydrochloric acid* is required to change the colour of the indicator to red.

Specific optical rotation (2.2.7): −43 to −47, determined on solution S and calculated with reference to the dried substance.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel H R* as the coating substance.

Test solution. Dissolve 0.10 g of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (a). Dilute 1 ml of the test solution to 200 ml with *methanol R*.

Reference solution (b). Dilute 2 ml of reference solution (a) to 5 ml with *methanol R*.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 5 volumes of *chloroform R*, 15 volumes of *ammonia R* and 80 volumes of *2-propanol R*. Dry the plate in a current of cold air, spray with *ninhydrin solution R* and heat at 100 °C to 105 °C for 5 min to 10 min. Examine in daylight. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (a) (0.5 per cent) and at most two such spots are more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent).

Ketones. Dilute 10.0 ml of solution S to 50.0 ml with 0.01 M *hydrochloric acid*. The absorbance (2.2.25), measured at 310 nm using 0.01 M *hydrochloric acid* as the compensation liquid, is not greater than 0.20.

Sulphates (2.4.13). 15 ml of solution S complies with the limit test for sulphates (500 ppm).

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.1500 g in a mixture of 0.5 ml of 0.1 M *hydrochloric acid* and 80 ml of *alcohol R*. Carry out a potentiometric titration (2.2.20) using 0.1 M *ethanolic sodium hydroxide*. Read the volume added between the two points of inflexion. 1 ml of 0.1 M *ethanolic sodium hydroxide* is equivalent to 20.37 mg of C₉H₁₄ClNO₂.

01/2005:2042

PHENYLMERCURIC ACETATE

Phenylhydrargyri acetat

C₈H₈HgO₂

M_r 336.7

DEFINITION

Content: 98.0 per cent to 100.5 per cent (dried substance).

CHARACTERS

Appearance: white or yellowish, crystalline powder or small, colourless crystals.

Solubility: slightly soluble in water, soluble in acetone and in alcohol.

IDENTIFICATION

First identification: A.

Second identification: B, C.

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of phenylmercuric acetate.

B. To 5 ml of solution S (see Tests) add 5 ml of *water R* and 0.1 ml of *sodium sulphide solution R*. A white precipitate is formed that darkens slowly on heating.

C. To 10 ml of solution S add 2 ml of *potassium iodide solution R* and shake vigorously. Filter. The filtrate gives reaction (b) of acetates (2.3.1).

TESTS

Solution S. Dissolve 0.250 g in 40 ml of *water R* by heating to boiling. Allow to cool and dilute to 50 ml with *water R*. Prepare the solution immediately before use.

Appearance of solution. Solution S is not more opalescent than reference suspension II (2.2.1) and is colourless (2.2.2, Method II).

Ionised mercury: maximum 0.2 per cent.

To 2 ml of solution S add 8 ml of *water R*, 2 ml of *potassium iodide solution R* and 3 ml of *dilute hydrochloric acid R*. Filter. The filtrate is not more coloured than the potassium iodide solution used. Wash the precipitate with 3 ml of *water R*. Combine the filtrate and the washings, add 2 ml of *dilute sodium hydroxide solution R* and dilute to 20 ml with *water R*. 12 ml of this solution complies with limit test A for heavy metals (2.4.8). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Polymercuric benzene compounds: maximum 1.5 per cent. Shake 0.2 g with 10 ml of *acetone R*. Filter. Wash the residue twice with 5 ml of *acetone R*. Dry the residue at 105 °C for 1 h. The residue weighs a maximum of 3 mg.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 0.500 g by drying in an oven at 45 °C for 15 h.

ASSAY

Dissolve with heating 0.300 g in 100 ml of *water R*. Cool and add 3 ml of *nitric acid R*. Titrate with 0.1 M *ammonium thiocyanate* using 2 ml of *ferric ammonium sulphate solution R2* as indicator, until a persistent reddish-yellow colour is obtained.

1 ml of 0.1 M *ammonium thiocyanate* is equivalent to 33.67 mg of phenylmercuric acetate.

STORAGE

Protected from light.

01/2005:0103

PHENYLMERCURIC BORATE

Phenylhydrargyri boras

DEFINITION

Phenylmercuric borate is a compound consisting of equimolecular proportions of phenylmercuric orthoborate and phenylmercuric hydroxide ($C_{12}H_{13}BHg_2O_4$; M_r 633) or of

the dehydrated form (metaborate, $C_{12}H_{11}BHg_2O_3$; M_r 615) or a mixture of the two compounds. It contains not less than 64.5 per cent and not more than 66.0 per cent of Hg (A_r 200.6) and not less than the equivalent of 9.8 per cent and not more than the equivalent of 10.3 per cent of borates, expressed as H_3BO_3 , both calculated with reference to the dried substance.

CHARACTERS

A white or slightly yellowish, crystalline powder or colourless, shiny crystals, slightly soluble in water and in alcohol.

IDENTIFICATION

A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the Ph. Eur. reference spectrum of phenylmercuric borate. Examine the substance as a disc.

B. To 2 ml of solution S (see Tests) add 8 ml of *water R* and 0.1 ml of *sodium sulphide solution R*. A white precipitate is formed that darkens slowly on heating.

C. Dissolve about 20 mg in 2 ml of *methanol R*. The solution is clear and colourless. Ignite; the solution burns with a green-edged flame.

TESTS

Solution S. Dissolve 0.25 g by sprinkling it on the surface of 25 ml of boiling *water R*, cool and dilute to 25 ml with *water R*.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, Method II).

Ionised mercury. To 10 ml of solution S add 2 ml of *potassium iodide solution R* and 3 ml of *dilute hydrochloric acid R*. Filter. The filtrate is colourless. Wash the precipitate with 3 ml of *water R*. Combine the filtrate and the washings, add 2 ml of *dilute sodium hydroxide solution R* and dilute to 20 ml with *water R*. 12 ml of this solution complies with limit test A for heavy metals (2.4.8). Prepare the standard using a mixture of 2.5 ml of *lead standard solution (2 ppm Pb) R* and 7.5 ml of *water R*.

Loss on drying (2.2.32). Not more than 3.5 per cent, determined on 0.50 g by drying in an oven at 45 °C for 15 h ($\pm$ 30 min).

ASSAY

Mercury. Dissolve 0.300 g in 100 ml of *water R* and add 3 ml of *nitric acid R*. Titrate with 0.1 M *ammonium thiocyanate*, using 2 ml of *ferric ammonium sulphate solution R2* as indicator, until a persistent reddish-yellow colour is obtained.

1 ml of 0.1 M *ammonium thiocyanate* is equivalent to 20.06 mg of Hg.

Borates. Dissolve 0.600 g with heating in 25 ml of *water R*. Dissolve 10 g of *sorbitol R* in the hot solution and cool. Titrate with 0.1 M *sodium hydroxide*, using 0.5 ml of *phenolphthalein solution R* as indicator, until a persistent pink colour is obtained. Carry out a blank titration.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 6.18 mg of H_3BO_3 .

STORAGE

Store protected from light.

01/2005:0783

01/2005:0683

PHENYLMERCURIC NITRATE

Phenylhydrargyri nitras

DEFINITION

Phenylmercuric nitrate is a mixture of phenylmercuric nitrate ($\text{C}_6\text{H}_5\text{HgNO}_3$; M_r 339.7) and phenylmercuric hydroxide ($\text{C}_6\text{H}_5\text{HgOH}$; M_r 294.7). It contains not less than 62.5 per cent and not more than 64.0 per cent of Hg (A_r 200.6), calculated with reference to the dried substance.

CHARACTERS

A white or pale yellow powder, very slightly soluble in water and in alcohol, slightly soluble in hot water. It dissolves in glycerol and in fatty oils.

IDENTIFICATION

- To 5 ml of solution S (see Tests) add 8 ml of *water R* and 0.1 ml of *sodium sulphide solution R*. A white precipitate is formed that darkens slowly on heating.
- To 1 ml of a saturated solution of the substance to be examined add 1 ml of *dilute hydrochloric acid R*. A white, flocculent precipitate is formed.
- To 5 ml of solution S add 1 ml of *dilute hydrochloric acid R*, 2 ml of *methylene chloride R* and 0.2 ml of *dithizone solution R*. Shake. The lower layer is orange-yellow.
- About 10 mg gives the reaction of nitrates (2.3.1).

TESTS

Solution S. To 0.1 g add 45 ml of *water R* and heat to boiling with shaking. Cool, filter and dilute to 50 ml with *water R*.

Appearance of solution. Solution S is colourless (2.2.2, *Method II*).

Inorganic mercuric compounds. To 10 ml of solution S add 2 ml of *potassium iodide solution R* and 3 ml of *dilute hydrochloric acid R*. Filter. The filtrate is colourless. Wash the precipitate with 2 ml of *water R*. Combine the filtrate and washings, add 2 ml of *dilute sodium hydroxide solution R* and dilute to 20 ml with *water R*. 12 ml of the solution complies with limit test A for heavy metals (0.1 per cent) (2.4.8). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying *in vacuo* for 24 h.

ASSAY

Dissolve 0.150 g in a mixture of 10 ml of *dilute nitric acid R* and 90 ml of *water R*, heating to boiling. Cool to 15 °C to 20 °C. Titrate with 0.1 M *ammonium thiocyanate* using 2 ml of *ferric ammonium sulphate solution R2* as indicator, until a persistent reddish-yellow colour is obtained. Carry out a blank titration.

1 ml of 0.1 M *ammonium thiocyanate* is equivalent to 20.06 mg of Hg.

STORAGE

Store protected from light.

PHENYLPROPANOLAMINE HYDROCHLORIDE

Phenylpropanolamini hydrochloridum

 $\text{C}_9\text{H}_{14}\text{ClNO}$ M_r 187.7**DEFINITION**

Phenylpropanolamine hydrochloride contains not less than 99.0 per cent and not more than the equivalent of 101.5 per cent of (1*RS*,2*SR*)-2-amino-1-phenylpropan-1-ol hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, freely soluble in water and in alcohol, practically insoluble in methylene chloride.

IDENTIFICATION

First identification: B, E.

Second identification: A, C, D, E.

- Melting point (2.2.14): 194 °C to 197 °C.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *phenylpropanolamine hydrochloride CRS*. Examine the substances prepared as discs without recrystallisation.
- Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- Dissolve 50 mg in 5 ml of *water R*, add 0.2 ml of *copper sulphate solution R* and 0.3 ml of *dilute sodium hydroxide solution R*. A violet colour develops. Add 2 ml of *ether R* and shake. A violet precipitate is formed between the two layers.
- It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 1.25 g in *water R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *methyl red solution R* and 0.2 ml of 0.01 M *sodium hydroxide*. The solution is yellow. Add 0.4 ml of 0.01 M *hydrochloric acid*. The solution is red.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel H R* as the coating substance.

Test solution (a). Dissolve 0.20 g of the substance to be examined in *alcohol R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *alcohol R*.

Reference solution (a). Dissolve 20 mg of *phenylpropanolamine hydrochloride CRS* in *alcohol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 1 ml of reference solution (a) to 10 ml with *alcohol R*.

Reference solution (c). Dissolve 20 mg of *norpseudoephedrine hydrochloride CRS* in *alcohol R*, add 1 ml of test solution (a) and dilute to 10 ml with *alcohol R*.

Reference solution (d). Dissolve 60 mg of *ammonium chloride R* in *methanol R* and dilute to 10 ml with the same solvent.

Before applying the solutions, spray the plate with a 20 g/l solution of *disodium tetraborate R*, using 8 ml for a plate 100 mm by 200 mm and dry in a stream of cold air for 30 min. Apply separately to the plate as bands about 10 mm by 3 mm 10 µl of each solution. Develop over a path of 10 cm using a mixture of 6 volumes of *concentrated ammonia R*, 24 volumes of *alcohol R* and 70 volumes of *butanol R*. Dry the plate in a current of warm air until the solvents have evaporated, allow to cool, spray with a 2 g/l solution of *ninhydrin R* in *alcohol R* and heat at 110 °C for 15 min. Any spot in the chromatogram obtained with test solution (a) apart from the principal spot and the spot corresponding to ammonium chloride is not more intense than the spot in the chromatogram obtained with reference solution (b) (1.0 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Phenylpropanonamine. Dissolve 1.0 g in 0.01 M *hydrochloric acid* and dilute to 50.0 ml with the same acid. The absorbance (2.2.25) of the solution measured at 283 nm is not greater than 0.10.

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.1500 g in a mixture of 5 ml of 0.01 M *hydrochloric acid* and 50 ml of *alcohol R*. Carry out a potentiometric titration (2.2.20), using 0.1 M *sodium hydroxide*. Read the volume added between the two points of inflexion.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 18.77 mg of $C_{15}H_{12}N_2O_2$.

01/2005:1253

PHENYTOIN

Phenytoinum

$C_{15}H_{12}N_2O_2$

M_r 252.3

DEFINITION

Phenytoin contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 5,5-diphenylimidazolidine-2,4-dione, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, sparingly soluble in alcohol, very slightly soluble in methylene chloride. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: A.

Second identification: B, C, D.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *phenytoin CRS*.
- Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).
- To about 10 mg add 1 ml of *water R* and 0.05 ml of *ammonia R*. Heat until boiling begins. Add 0.05 ml of a 50 g/l solution of *copper sulphate R* in *dilute ammonia R2* and shake. A pink, crystalline precipitate is formed.
- It complies with the test for sulphated ash (see Tests).

TESTS

Appearance of solution. Dissolve 1.0 g in a mixture of 5 ml of 1 M *sodium hydroxide* and 20 ml of *water R*. The solution is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, *Method II*).

Acidity or alkalinity. To 1.0 g add 45 ml of *water R* and boil for 2 min. Allow to cool and filter. Wash the filter with *carbon dioxide-free water R* and dilute the combined filtrate and washings to 50 ml with the same solvent. To 10 ml of the solution add 0.15 ml of *methyl red solution R*. Not more than 0.5 ml of 0.01 M *hydrochloric acid* is required to change the colour of the indicator to red. To 10 ml of the solution add 0.15 ml of *bromothymol blue solution R1*. Not more than 0.5 ml of 0.01 M *sodium hydroxide* is required to change the colour of the indicator to blue.

Related substances. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm. Before use, wash the plate with a mixture of 30 volumes of *dioxan R* and 75 volumes of *hexane R*. Allow the plate to dry in air.

Test solution (a). Dissolve 0.40 g of the substance to be examined in a mixture of equal volumes of *acetone R* and *methanol R* and dilute to 10 ml with the same mixture of solvents.

Test solution (b). Dilute 1 ml of test solution (a) to 20 ml with a mixture of equal volumes of *acetone R* and *methanol R*.

Reference solution (a). Dissolve 20 mg of *phenytoin CRS* in a mixture of equal volumes of *acetone R* and *methanol R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dissolve 8 mg of *benzophenone R* in a mixture of equal volumes of *acetone R* and *methanol R* and dilute to 100 ml with the same mixture of solvents.

Reference solution (c). Dissolve 8 mg of *benzil R* in a mixture of equal volumes of *acetone R* and *methanol R* and dilute to 100 ml with the same mixture of solvents.

Reference solution (d). Dilute 1 ml of test solution (a) to 100 ml with a mixture of equal volumes of *acetone R* and *methanol R*.

Reference solution (e). Mix 1 ml of reference solution (b) and 1 ml of reference solution (c).

Apply separately to the plate 10 µl of each solution and dry the plate in a stream of cold air for 2 min. Develop over a path of 15 cm using a mixture of 30 volumes of *dioxan R* and 75 volumes of *hexane R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. In the chromatogram obtained with test solution (a): any spot corresponding to benzophenone is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent); any spot corresponding to benzil is not more intense than the spot in the chromatogram obtained with reference solution (c) (0.2 per cent) and any spot, apart from the principal spot and any spot corresponding to benzo-phenone and benzil, is not more intense than the spot in the chromatogram obtained with reference solution (d) (1 per cent). The test is not valid unless the chromatogram obtained with reference solution (e) shows two clearly separated principal spots.

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 50 ml of *dimethylformamide R*. Titrate with 0.1 M *sodium methoxide*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *sodium methoxide* is equivalent to 25.23 mg of $C_{15}H_{12}N_2O_2$.

IMPURITIES

A. R = C_6H_5 : diphenylmethanone (benzophenone),

B. R = $CO-C_6H_5$: diphenylethanedione (benzil).

01/2005:0521

PHENYTOIN SODIUM

Phenytoinum natricum

$C_{15}H_{11}N_2NaO_2$

M_r 274.3

DEFINITION

Phenytoin sodium contains not less than 98.5 per cent and not more than the equivalent of 100.5 per cent of sodium 4-oxo-5,5-diphenyl-4,5-dihydro-1H-imidazol-2-olate, calculated with reference to the anhydrous substance.

CHARACTERS

A white, crystalline powder, slightly hygroscopic, soluble in water and in alcohol, practically insoluble in methylene chloride.

IDENTIFICATION

First identification: A, C.

Second identification: B, C.

- Dissolve 0.1 g in 20 ml of *water R*. Acidify with *dilute hydrochloric acid R* and shake with three quantities, each of 30 ml, of *chloroform R*. Wash the combined chloroform layers with *water R*, evaporate to dryness and dry the residue at 100 °C to 105 °C (test residue). Repeat the operations using 0.1 g of *phenytoin sodium CRS* (reference residue). Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *phenytoin sodium CRS*. Examine as discs prepared using *potassium bromide R*.
- To about 10 mg add 1 ml of *water R* and 0.05 ml of *ammonia R*. Heat until boiling begins. Add 0.05 ml of a 50 g/l solution of *copper sulphate R* in *dilute ammonia R2* and shake. A pink, crystalline precipitate is formed.
- Ignite 1 g and cool. Add 2 ml of *water R* to the residue and neutralise the solution with *hydrochloric acid R*. Filter and dilute the filtrate to 4 ml with *water R*. 0.1 ml of the solution gives reaction (b) of sodium (2.3.1).

TESTS

Appearance of solution. Suspend 1.0 g in 5 ml of *water R* and dilute to 20 ml with 0.1 M *sodium hydroxide*. The solution is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, *Method II*).

Related substances. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel containing a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 0.4 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dilute 1 ml of the test solution to 100 ml with *methanol R*.

Reference solution (b). Dissolve 20 mg of *benzophenone R* in *methanol R* and dilute to 100 ml with the same solvent.

Apply separately to the plate 10 µl of each solution and dry the plate in a stream of cold air for 2 min. Develop over a path of 15 cm using a mixture of 10 volumes of *concentrated ammonia R*, 45 volumes of *chloroform R* and 45 volumes of *2-propanol R*. Dry the plate in an oven at 80 °C for 5 min and examine in ultraviolet light at 254 nm. In the chromatogram obtained with the test solution, any spot corresponding to benzophenone is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent) and any spot, apart from the principal spot and the spot corresponding to benzophenone, is not more intense than the spot in the chromatogram obtained with reference solution (a) (1.0 per cent).

Free phenytoin. Dissolve 0.30 g in 10 ml of a mixture of equal volumes of *pyridine R* and *water R*. Add 0.5 ml of *phenolphthalein solution R* and 3 ml of *silver nitrate solution in pyridine R*. Not more than 1.0 ml of 0.1 M *sodium hydroxide* is required to change the colour of the indicator to pink.

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (2.5.12). Not more than 3.0 per cent, determined on 1.000 g by the semi-micro determination of water.

ASSAY

Suspend 0.180 g in 2 ml of *water R*. Add 8.0 ml of 0.05 M *sulphuric acid* and heat gently for 1 min. Add 30 ml of *methanol R* and cool. Carry out a potentiometric titration (2.2.20), using 0.1 M *sodium hydroxide*. After reaching the first point of inflexion, interrupt the addition of 0.1 M *sodium hydroxide*, add 5 ml of *silver nitrate solution in pyridine R*, mix and continue the titration. Read the volume of 0.1 M *sodium hydroxide* added between the two points of inflexion.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 27.43 mg of $C_{15}H_{11}N_2NaO_2$.

STORAGE

Store in an airtight container.

01/2005:0522

PHOLCODINE

Pholcodinum

 $C_{23}H_{30}N_2O_4 \cdot H_2O$
 M_r 416.5

DEFINITION

Pholcodine contains not less than 98.5 per cent and not more than the equivalent of 100.5 per cent of 7,8-didehydro-4,5 α -epoxy-17-methyl-3-[2-(morpholin-4-yl)ethoxy]morphinan-6 α -ol, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder or colourless crystals, sparingly soluble in water, freely soluble in acetone and in alcohol. It dissolves in dilute mineral acids.

IDENTIFICATION

First identification: A.

Second identification: B, C.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of pholcodine*.
- Dissolve 0.100 g in *water R* and dilute to 100.0 ml with the same solvent. To 10.0 ml of this solution add 75 ml of *water R* and 10 ml of 1 M *sodium hydroxide* and dilute to 100.0 ml with *water R*. Examined between 230 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 284 nm. The specific absorbance at the maximum is 36 to 38.
- Dissolve 50 mg in 1 ml of *sulphuric acid R* and add 0.05 ml of *ammonium molybdate solution R*. A pale-blue colour is produced which becomes deep blue on gentle warming. Add 0.05 ml of *dilute nitric acid R*. The colour becomes brownish-red.

TESTS

Specific optical rotation (2.2.7). Dissolve 1.000 g in *alcohol R* and dilute to 50.0 ml with the same solvent. The specific optical rotation is -94 to -98 , calculated with reference to the dried substance.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. Dissolve 0.25 g of the substance to be examined in *chloroform R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dilute 0.5 ml of the test solution to 50 ml with *chloroform R*.

Reference solution (b). Dilute 5 ml of reference solution (a) to 10 ml with *chloroform R*.

Apply separately to the plate 10 μ l of each solution. Develop over a path of 15 cm using a mixture of 2.5 volumes of *concentrated ammonia R*, 32.5 volumes of *acetone R*, 35 volumes of *alcohol R* and 35 volumes of *toluene R*. Dry the plate in a current of air and spray with *dilute potassium iodobismuthate solution R*. In the chromatogram obtained with the test solution, any spot apart from the principal spot is not more intense than the spot in the chromatogram obtained with reference solution (a) (1.0 per cent) and not more than one such spot situated above the principal spot is more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Morphine. Dissolve 0.10 g in 0.1 M *hydrochloric acid* and dilute to 5 ml with the same acid. Add 2 ml of a 10 g/l solution of *sodium nitrite R*, allow to stand for 15 min and add 3 ml of *dilute ammonia R1*. The solution is not more intensely coloured than reference solution B₄ (2.2.2, *Method II*) (about 0.13 per cent of morphine).

Loss on drying (2.2.32): 3.9 per cent to 4.5 per cent, determined on 0.500 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.180 g in 50 ml of *anhydrous acetic acid R*, warming gently. Titrate with 0.1 M *perchloric acid* determining the end-point potentiometrically (2.2.20) at the second point of inflexion.

1 ml of 0.1 M *perchloric acid* is equivalent to 19.93 mg of $C_{23}H_{30}N_2O_4$.

01/2005:0004

PHOSPHORIC ACID, CONCENTRATED

Acidum phosphoricum concentratum

 H_3PO_4
 M_r 98.0

DEFINITION

Concentrated phosphoric acid contains not less than 84.0 per cent *m/m* and not more than 90.0 per cent *m/m* of H_3PO_4 .

CHARACTERS

A clear, colourless, syrupy liquid, corrosive, miscible with water and with alcohol. When stored at a low temperature it may solidify into a mass of colourless crystals which do not melt at a temperature below 28 °C.

It has a relative density of about 1.7.

IDENTIFICATION

- Dilute with *water R*. The solution is strongly acid (2.2.4).
- Solution S (see Tests) neutralised with *dilute sodium hydroxide solution R* gives the reactions of phosphates (2.3.1).

TESTS

Solution S. Dilute 10.0 g to 150 ml with *water R*.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Substances precipitated with ammonia. To 10 ml of solution S add 8 ml of *dilute ammonia R1*. Any opalescence in the solution is not more intense than that in a mixture of 10 ml of solution S and 8 ml of *water R*.

Hypophosphorous acid and phosphorous acid. To 5 ml of solution S add 2 ml of *silver nitrate solution R2* and heat on a water-bath for 5 min. The solution shows no change in appearance.

Chlorides (2.4.4). 15 ml of solution S complies with the limit test for chlorides (50 ppm).

Sulphates (2.4.13). 1.5 g diluted to 15 ml with *distilled water R* complies with the limit test for sulphates (100 ppm).

Arsenic (2.4.2). 7.5 ml of solution S complies with limit test A for arsenic (2 ppm).

Iron (2.4.9). 3 ml of solution S diluted to 10 ml with *water R* complies with the limit test for iron (50 ppm).

Heavy metals (2.4.8). To 2.5 g add 4 ml of *dilute ammonia R1* and dilute to 25 ml with *water R*. 12 ml of the solution complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

ASSAY

To 1.000 g add a solution of 10 g of *sodium chloride R* in 30 ml of *water R*. Titrate with 1 M *sodium hydroxide*, using *phenolphthalein solution R* as indicator.

1 ml of 1 M *sodium hydroxide* is equivalent to 49.00 mg of H_3PO_4 .

STORAGE

Store in a glass container.

01/2005:0005

PHOSPHORIC ACID, DILUTE

Acidum phosphoricum dilutum

DEFINITION

Dilute phosphoric acid contains 9.5 per cent *m/m* to 10.5 per cent *m/m* of H_3PO_4 (M_r 98.0).

PREPARATION

To 115 g of concentrated phosphoric acid add 885 g of *water R* and mix.

IDENTIFICATION

- A. It is strongly acid (2.2.4).
- B. Solution S (see Tests), neutralised with *dilute sodium hydroxide solution R*, gives the reactions of phosphates (2.3.1).

TESTS

Solution S. Dilute 86 g to 150 ml with *water R*.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Substances precipitated with ammonia. To 10 ml of solution S add 8 ml of *dilute ammonia R1*. Any opalescence in the solution is not more intense than that in a mixture of 10 ml of solution S and 8 ml of *water R*.

Hypophosphorous acid and phosphorous acid. To 5 ml of solution S add 2 ml of *silver nitrate solution R2* and heat on a water-bath for 5 min. The solution shows no change in appearance.

Chlorides (2.4.4). 15 ml of solution S complies with the limit test for chlorides (6 ppm).

Sulphates (2.4.13). 15 ml of the substance to be examined complies with the limit test for sulphates (10 ppm).

Arsenic (2.4.2). 7.5 ml of solution S complies with limit test A for arsenic (0.2 ppm).

Iron (2.4.9). 3 ml of solution S diluted to 10 ml with *water R* complies with the limit test for iron (6 ppm).

Heavy metals (2.4.8). To 20 g of the substance to be examined add 4 ml of *dilute ammonia R1* and dilute to 25 ml with *water R*. 12 ml of the solution complies with limit test A for heavy metals (1 ppm). Prepare the standard using a mixture of 8 ml of *lead standard solution (1 ppm Pb) R* and 2 ml of *water R*.

ASSAY

To 8.60 g add a solution of 10 g of *sodium chloride R* in 30 ml of *water R*. Titrate with 1 M *sodium hydroxide*, using *phenolphthalein solution R* as indicator.

1 ml of 1 M *sodium hydroxide* is equivalent to 49.00 mg of H_3PO_4 .

01/2005:0352

PHTHALYLSULFATHIAZOLE

Phthalylsulfathiazolum

 $\text{C}_{17}\text{H}_{13}\text{N}_3\text{O}_5\text{S}_2$ M_r 403.4

DEFINITION

Phthalylsulfathiazole contains not less than 98.5 per cent and not more than the equivalent of 101.5 per cent of 2-[[4-(thiazol-2-ylsulphamoyl)phenyl]carbamoyl]benzoic acid, calculated with reference to the dried substance.

CHARACTERS

A white or yellowish-white, crystalline powder, practically insoluble in water, freely soluble in dimethylformamide, slightly soluble in acetone and in alcohol.

IDENTIFICATION

First identification: A, B, E.

Second identification: B, C, D, E.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *phthalylsulfathiazole CRS*.
- B. To 1 g add 8.5 ml of *dilute sodium hydroxide solution R* and boil under a reflux condenser for 30 min. Cool and add 17.5 ml of *dilute hydrochloric acid R*. Shake vigorously and filter. Neutralise the filtrate with *dilute sodium hydroxide solution R*. Filter, wash the precipitate with *water R*, recrystallise from *water R* and dry the crystals at 100 °C to 105 °C. The crystals melt (2.2.14) at 200 °C to 203 °C.

01/2005:0286

- C. To 0.1 g in a test-tube add 3 ml of *dilute sulphuric acid R* and 0.5 g of *zinc powder R*. Fumes are evolved which produce a black stain on *lead acetate paper R*.
- D. To 0.1 g add 0.5 g of *resorcinol R* and 0.3 ml of *sulphuric acid R* and heat on a water-bath until a homogeneous mixture is obtained. Allow to cool. Add 5 ml of *dilute sodium hydroxide solution R*. Dilute 0.1 ml of this brownish-red mixture to 25 ml with *water R*. An intense green fluorescence appears which disappears on acidification.
- E. Dissolve about 10 mg of the crystals obtained in identification test B in 200 ml of *0.1 M hydrochloric acid*. 2 ml of the solution gives the reaction of primary aromatic amines (2.3.1) with formation of an orange precipitate.

TESTS

Appearance of solution. Dissolve 1.0 g in *1 M sodium hydroxide* and dilute to 20 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution BY₅ (2.2.2, Method II).

Acidity. To 2.0 g add 20 ml of *water R*, shake continuously for 30 min and filter. To 10 ml of the filtrate add 0.1 ml of *phenolphthalein solution R*. Not more than 0.2 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator.

Sulfathiazole and other primary aromatic amines. Dissolve 5 mg in a mixture of 3.5 ml of *water R*, 6 ml of *dilute hydrochloric acid R* and 25 ml of *alcohol R*, previously cooled to 15 °C. Place immediately in iced water and add 1 ml of a 2.5 g/l solution of *sodium nitrite R*. Allow to stand for 3 min, add 2.5 ml of a 40 g/l solution of *sulphamic acid R* and allow to stand for 5 min. Add 1 ml of a 4 g/l solution of *naphthylethylenediamine dihydrochloride R* and dilute to 50 ml with *water R*. Measured at 550 nm, the absorbance (2.2.25) is not greater than that of a standard prepared at the same time and in the same manner using a mixture of 1 ml of a solution containing in 100 ml; 10 mg of *sulfathiazole R* and 0.5 ml of *hydrochloric acid R*, 2.5 ml of *water R*, 6 ml of *dilute hydrochloric acid R* and 25 ml of *alcohol R*.

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 2 per cent, determined on 1.00 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 40 ml of *dimethylformamide R*. Titrate with *0.1 M sodium hydroxide* until the colour becomes blue, using 0.2 ml of *thymolphthalein solution R* as indicator. Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 20.17 mg of C₂₂H₂₇N₃O₅S₂.

STORAGE

Store protected from light.

PHYSOSTIGMINE SALICYLATE

Physostigmini salicylas

Eserini salicylas

C₂₂H₂₇N₃O₅M_r 413.5

DEFINITION

Physostigmine salicylate contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (3a*S*,8a*R*)-1,2,3,3a,8,8a-hexahydro-1,3a,8-trimethylpyrrolo[2,3-*b*]indol-5-yl methylcarbamate salicylate, calculated with reference to the dried substance.

CHARACTERS

Colourless or almost colourless crystals, sparingly soluble in water, soluble in alcohol. The crystals gradually become red when exposed to air and light; the colour develops more quickly when the crystals are also exposed to moisture. Aqueous solutions are unstable.

It melts at about 182 °C, with decomposition.

IDENTIFICATION

First identification: A, B.

Second identification: B, C, D.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *physostigmine salicylate CRS*.
- Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- Heat about 10 mg in a porcelain dish with a few drops of *dilute ammonia R1*. An orange colour develops. Evaporate the solution to dryness. The residue dissolves in *alcohol R* giving a blue solution. Add 0.1 ml of *glacial acetic acid R*. The colour becomes violet. Dilute with *water R*. An intense red fluorescence appears.
- Solution S (see Tests) gives reaction (a) of salicylates (2.3.1).

TESTS

Solution S. Dissolve 0.900 g, without heating, in 95 ml of *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100.0 ml with the same solvent. Prepare immediately before use.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, Method II).

pH (2.2.3). The pH of solution S is 5.1 to 5.9.

Specific optical rotation (2.2.7): −90 to −94, determined on solution S and calculated with reference to the dried substance.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution (a). Dissolve 0.2 g of the substance to be examined in *alcohol R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 2.5 ml of test solution (a) to 50 ml with *alcohol R*.

Reference solution (a). Dissolve 10 mg of *physostigmine salicylate CRS* in *alcohol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 2 ml of reference solution (a) to 20 ml with *alcohol R*.

Apply to the plate 20 µl of each solution. Develop over a path of 15 cm using a mixture of 2 volumes of *concentrated ammonia R*, 23 volumes of *2-propanol R* and 100 volumes of *cyclohexane R*. Dry the plate in a current of cold air and carry out a second development in the same direction. Allow the plate to dry in air and spray with freshly prepared *potassium iodobismuthate solution R* and then with *dilute hydrogen peroxide solution R*. Examine the plate within 2 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Eseridine. To 5 ml of solution S add a few crystals of *potassium iodate R*, 0.05 ml of *dilute hydrochloric acid R* and 2 ml of *chloroform R*. Shake. No violet colour develops in the chloroform layer within 1 min.

Sulphates (2.4.13). 15 ml of solution S complies with the limit test for sulphates (0.1 per cent).

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.00 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on the residue obtained in the test for loss on drying.

ASSAY

Dissolve 0.350 g in 50 ml of a mixture of equal volumes of *anhydrous acetic acid R* and *chloroform R*. Titrate with 0.1 M *perchloric acid* determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 41.35 mg of $C_{30}H_{44}N_6O_8$.

STORAGE

Store in an airtight container, protected from light.

DEFINITION

Physostigmine sulphate contains not less than 97.0 per cent and not more than the equivalent of 101.0 per cent of di[(3aS,8aR)-1,2,3,3a,8,8a-hexahydro-1,3a,8-trimethylpyrrolo[2,3-b]indol-5-yl methylcarbamate] sulphate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, hygroscopic, very soluble in water, freely soluble in alcohol. It gradually becomes red when exposed to air and light; the colour develops more quickly when the substance is also exposed to moisture. Aqueous solutions are unstable.

It melts at about 145 °C, with decomposition.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *physostigmine sulphate CRS*. Examine the substances prepared as discs using *potassium bromide R*.
- Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- Heat about 10 mg in a porcelain dish with 0.5 ml of *dilute ammonia R1*. An orange colour develops. Evaporate the solution to dryness. The residue dissolves in *alcohol R* giving a blue solution. Add 0.1 ml of *glacial acetic acid R*. The colour becomes violet. Dilute with water. An intense red fluorescence appears.
- It gives reaction (a) of sulphates (2.3.1).

TESTS

Solution S. Dissolve 0.500 g without heating in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent. Prepare immediately before use.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 3.5 to 5.5.

Specific optical rotation (2.2.7): –116 to –120, determined on solution S and calculated with reference to the dried substance.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution (a). Dissolve 0.15 g of the substance to be examined in *alcohol R* and dilute to 5 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *alcohol R*.

Reference solution (a). Dissolve 30 mg of *physostigmine sulphate CRS* in *alcohol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 5 ml of test solution (b) to 100 ml with *alcohol R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 2 volumes of *concentrated ammonia R*, 23 volumes of *2-propanol R* and 100 volumes of *cyclohexane R*. Dry the plate in a current of cold air and carry out a second development in the same direction. Allow the plate to dry in air and spray with freshly prepared *potassium iodo-bismuthate solution R* and then with *dilute hydrogen peroxide solution R*. Examine the plate within 2 min. Any spot in the chromatogram obtained

01/2005:0684

PHYSOSTIGMINE SULPHATE

Physostigmini sulfas

Eserini sulfas

$C_{30}H_{44}N_6O_8S$

M_r 649

with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Eseridine. To 5 ml of solution S add a few crystals of *potassium iodate R*, 0.05 ml of *dilute hydrochloric acid R* and 2 ml of *chloroform R* and shake. After 1 min, the chloroform layer is not more intensely coloured than a reference solution prepared at the same time in the same manner using 5 ml of *water R* instead of solution S.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on the residue obtained in the test for loss on drying.

ASSAY

Dissolve 0.5000 g in a mixture of 20 ml of *anhydrous acetic acid R* and 40 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid* determining the end-point potentiometrically (2.2.20) at the first inflexion point.

1 ml of 0.1 M *perchloric acid* is equivalent to 64.88 mg of $C_{30}H_{44}N_6O_8S$.

STORAGE

Store in a well-filled, airtight glass container, protected from light.

01/2005:1036

PHYTOMENADIONE

Phytomenadionum

$C_{31}H_{46}O_2$

M_r 450.7

DEFINITION

Phytomenadione is a mixture of 2-methyl-3-[(2E)-(7R,11R)-3,7,11,15-tetramethylhexadec-2-enyl]naphthalene-1,4-dione (*trans*-phytomenadione), 2-methyl-3-[(2Z)-(7R,11R)-3,7,11,15-tetramethylhexadec-2-enyl]naphthalene-1,4-dione (*cis*-phytomenadione) and 2,3-epoxy-2-methyl-3-[(2E)-(7R,11R)-3,7,11,15-tetramethylhexadec-2-enyl]-2,3-dihydronaphthalene-1,4-dione (*trans*-epoxyphytomenadione). It contains not more than 4.0 per cent of *trans*-epoxyphytomenadione and not less than 75.0 per cent of *trans*-phytomenadione. The total of the three components is not less than 97.0 per cent and not more than the equivalent of 103.0 per cent.

CHARACTERS

A clear, intense yellow, viscous, oily liquid, practically insoluble in water, sparingly soluble in alcohol, miscible with fatty oils.

It decomposes on exposure to actinic light.

The refractive index is about 1.526.

IDENTIFICATION

Carry out all operations as rapidly as possible avoiding exposure to actinic light.

- Dissolve 10.0 mg in *trimethylpentane R* and dilute to 100.0 ml with the same solvent. Examined between 275 nm and 340 nm (2.2.25), the solution shows an absorption maximum at 327 nm and an absorption minimum at 285 nm. The specific absorbance at the maximum is 67 to 73. Dilute 10.0 ml of the solution to 50.0 ml with *trimethylpentane R*. Examined between 230 nm and 280 nm, the solution shows four absorbance maxima, at 243 nm, 249 nm, 261 nm and 270 nm respectively.
- Examine the chromatograms obtained in the test for menadione and other related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- Dissolve 50 mg in 10 ml of *methanol R* and add 1 ml of a 200 g/l solution of *potassium hydroxide R* in *methanol R*. A green colour is produced which becomes violet-red on heating in a water-bath at 40 °C and then reddish-brown on standing.

TESTS

Appearance of solution. Dissolve 2.5 g in *trimethylpentane R* and dilute to 25 ml with the same solvent. The solution is clear (2.2.1).

Acid value (2.5.1). Not more than 2.0, determined on 2.00 g.

Menadione and other related substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*.

Test solution (a). Dissolve 0.40 g of the substance to be examined in *cyclohexane R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *cyclohexane R*.

Reference solution (a). Dissolve 40 mg of *phytomenadione CRS* in *cyclohexane R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 1 ml of test solution (b) to 20 ml with *cyclohexane R*.

Reference solution (c). Dissolve 4.0 mg of *menadione R* in *cyclohexane R* and dilute to 50 ml with the same solvent.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of *cyclohexane R* and 80 volumes of *toluene R*. Allow the plate to dry in air for 5 min. Examine in ultraviolet light at 254 nm and spray with a 100 g/l solution of *phosphomolybdic acid R* in *ethanol R*. Heat at 120 °C for 5 min. Examine in daylight. In the chromatogram obtained with test solution (a): any spot corresponding to menadione is not more intense than the spot in the chromatogram obtained with reference solution (c) (0.2 per cent); any spot, apart from the principal spot and any spot corresponding to menadione, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). Disregard any spot below the principal spot, which may not be completely separated from the principal spot.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 15.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 15.0 mg of *phytomenadione CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 15.0 mg of *phytomenadione CRS* and 4.0 mg of *trans-epoxyphytomenadione CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with spherical *silica gel for chromatography R* (5 µm) with a porosity of 8 nm,
- as mobile phase at a flow rate of 0.4 ml/min a mixture of 0.67 volumes of *octanol R*, 3.3 volumes of *di-isopropyl ether R* and 1000 volumes of *heptane R*,
- as detector a spectrophotometer set at 254 nm,
- a 20 µl loop injector.

Inject reference solution (b). When using a recorder, adjust the sensitivity of the system so that the height of the principal peak is at least 50 per cent of the full scale of the recorder. The test is not valid unless the order of elution of the peaks is: *trans-epoxyphytomenadione*, *cis-phytomenadione* and *trans-phytomenadione*. Carry out six replicate injections of reference solution (a). The assay is not valid unless the relative standard deviation of the peak area of the *trans*-isomer is less than 1.0 per cent and the resolution between the peaks corresponding to *trans-phytomenadione* and *cis-phytomenadione* is at least 2.5. Inject the test solution and reference solution (a) and calculate the percentage contents of *trans-phytomenadione*, *cis-phytomenadione* and *trans-epoxyphytomenadione* using the following expressions:

$$\text{trans-phytomenadione} = \frac{m' \times A'_{\text{trans}} \times S_{\text{trans}}}{m \times S'_{\text{trans}}}$$

$$\text{cis-phytomenadione} = \frac{m' \times A'_{\text{cis}} \times S_{\text{cis}}}{m \times S'_{\text{cis}}}$$

$$\text{trans-epoxyphytomenadione} = \frac{m' \times A'_{\text{epoxy}} \times S_{\text{epoxy}}}{m \times S'_{\text{epoxy}}}$$

- m' = mass of the reference substance in reference solution (a), in milligrams,
- m = mass of the substance to be examined in the test solution, in milligrams,
- A'_{trans} = percentage content of *trans-phytomenadione* in *phytomenadione CRS*,
- A'_{cis} = percentage content of *cis-phytomenadione* in *phytomenadione CRS*,
- A'_{epoxy} = percentage content of *trans-epoxyphytomenadione* in *phytomenadione CRS*,
- S_{trans} = area of the peak corresponding to the *trans*-isomer in the chromatogram obtained with the test solution,
- S_{cis} = area of the peak corresponding to the *cis*-isomer in the chromatogram obtained with the test solution,
- S_{epoxy} = area of the peak corresponding to *trans-epoxyphytomenadione* in the chromatogram obtained with the test solution,

S'_{trans} = area of the peak corresponding to the *trans*-isomer in the chromatogram obtained with reference solution (a),

S'_{cis} = area of the peak corresponding to the *cis*-isomer in the chromatogram obtained with reference solution (a),

S'_{epoxy} = area of the peak corresponding to *trans-epoxyphytomenadione* in the chromatogram obtained with reference solution (a).

STORAGE

Store protected from light.

IMPURITIES

A. 2-methylnaphthalene-1,4-dione (menadione).

01/2005:1911

PHYTOSTEROL

Phytosterolum

DEFINITION

Natural mixture of sterols obtained from plants of the genera *Hypoxis*, *Pinus* and *Picea*.

Content: minimum 70.0 per cent of β -sitosterol (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, soluble in tetrahydrofuran, sparingly soluble in ethyl acetate.

IDENTIFICATION

- A. Mix 1 ml of *acetic anhydride R* with 0.5 ml of solution S (see Tests). After the addition of 0.1 ml of *sulphuric acid R* a red colour is produced which changes rapidly to violet then to blue and finally to green.
- B. Examine the chromatograms obtained in the assay.
- Results:** the principal peak in the chromatogram obtained with the test solution is similar in retention time to the peak in the chromatogram obtained with reference solution (b).

TESTS

Solution S. Dissolve 1.0 g in *tetrahydrofuran R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, Method II).

Acidity or alkalinity. Shake 0.20 g with a mixture of 4.0 ml of *ethyl acetate R* and 10.0 ml of *carbon dioxide-free water R* for 3 min. Allow the layers to separate. To the aqueous layer add 0.1 ml of *bromothymol blue solution R1*. If the solution is yellow not more than 0.5 ml of 0.01 M *sodium hydroxide* is required to change the colour to blue. If the solution is blue not more than 0.5 ml of 0.01 M *hydrochloric acid* is required to change the colour to yellow.

Specific optical rotation (2.2.7): -15 to -28 (dried substance).

Dissolve 0.500 g in *ethyl acetate R* and dilute to 10.0 ml with the same solvent.

Acid value (2.5.1): maximum 1.0, determined on 2.0 g.

Peroxide value (2.5.5): maximum 10.0.

Saponification value (2.5.6): maximum 3.

Other sterols. Examine the chromatogram obtained with the test solution in the assay (Figure 1911-1).

Composition of the other sterols:

- *cholesterol*: maximum 0.5 per cent,
- *brassicasterol*: maximum 0.5 per cent,
- *campesterol*: maximum 15.0 per cent,
- *campestanol*: maximum 5.0 per cent,
- *stigmasterol*: maximum 5.0 per cent,
- *sitostanol*: maximum 15.0 per cent,
- Δ^7 -*stigmasterol*: maximum 5.0 per cent.

Loss on drying (2.2.32): maximum 4.0 per cent, determined on 0.250 g by drying in an oven at 100–105 °C for 2 h.

Total ash (2.4.16): maximum 0.5 per cent, determined on 1.0 g.

ASSAY

Gas chromatography (2.2.28): use the normalisation procedure.

Test solution. Dissolve 0.100 g in *tetrahydrofuran R* and dilute to 10.0 ml with the same solvent. Introduce 100 µl of this solution into a 3 ml flask and evaporate to dryness under *nitrogen R*. Add 100 µl of a freshly prepared mixture of 50 µl of *1-methylimidazole R* and 1.0 ml of *heptafluoro-N-methyl-N-(trimethylsilyl)butanamide R*, close the flask tightly and heat to 100 °C for 15 min. Allow to cool.

Reference solution (a). Dissolve 25 mg of β -sitosterol *R* and 25 mg of sitostanol *R* in *tetrahydrofuran R* and dilute to 10.0 ml with the same solvent. Introduce 100 µl of this solution into a 3 ml flask and evaporate to dryness under *nitrogen R*. Add 100 µl of a freshly prepared mixture of 50 µl of *1-methylimidazole* and 1.0 ml of *heptafluoro-N-methyl-N-(trimethylsilyl)butanamide R*. Close the flask tightly and heat to 100 °C for 15 min. Allow to cool.

Reference solution (b). Dissolve 0.100 g of β -sitosterol *R* in *tetrahydrofuran R* and dilute to 10.0 ml with the same solvent. Introduce 100 µl of this solution into a 3 ml flask and evaporate to dryness under *nitrogen R*. Add 100 µl of a freshly prepared mixture of 50 µl of *1-methylimidazole R* and 1.0 ml of *heptafluoro-N-methyl-N-(trimethylsilyl)butanamide R*. Close the flask tightly and heat to 100 °C for 15 min. Allow to cool.

Column:

- *material*: quartz,
- *size*: $l = 25$ m, $\varnothing = 0.3$ mm,
- *stationary phase*: poly(dimethyl)(diphenyl)(divinyl)siloxane *R* (1 µm).

Carrier gas: hydrogen for chromatography *R*.

Flow rate: 2 ml/min.

Split ratio: 1:20.

Temperature:

- *column*: 280 °C,
- *injection port and detector*: 300 °C.

Detection: flame ionisation.

Injection: 1 µl.

Relative retentions with reference to β -sitosterol (retention time = about 16 min): cholesterol = about 0.7; brassicasterol = about 0.77; campesterol = about 0.84; campestanol = about 0.86; stigmasterol = about 0.9; sitostanol = about 1.02; Δ^7 -stigmasterol = about 1.1.

System suitability: reference solution (a):

- *resolution*: minimum of 1.0 between the peaks due to β -sitosterol and sitostanol.

STORAGE

In an airtight container, protected from light.

Figure 1911-1. – Assay of phytosterol (trimethylsilane derivatives)

PICOTAMIDE MONOHYDRATE

Picotamidum monohydricum

$C_{21}H_{20}N_4O_3 \cdot H_2O$

M_r 394.4

DEFINITION

Picotamide monohydrate contains not less than 98.0 per cent and not more than 101.0 per cent of 4-methoxy-*N,N'*-bis(pyridin-3-ylmethyl)benzene-1,3-dicarboxamide, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, slightly soluble in water, soluble in ethanol and in methylene chloride. It dissolves in dilute mineral acids.

It shows polymorphism.

IDENTIFICATION

Examine by infrared spectrophotometry (2.2.24), comparing with the spectrum obtained with *picotamide monohydrate CRS*. If the spectra obtained in the solid state shows differences, dissolve the substance to be examined and the reference substance separately in *acetone R*, evaporate to dryness and record new spectra using the residues.

TESTS

Appearance of solution. Dissolve 2.5 g in *methanol R* and dilute to 50 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, *Method II*).

Related substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*.

Test solution. Dissolve 0.5 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dilute 1 ml of the test solution to 10 ml with *methanol R*. Dilute 1 ml of the solution to 20 ml with *methanol R*.

Reference solution (b). Dilute 5 ml of reference solution (a) to 10 ml with *methanol R*.

Reference solution (c). Dissolve 0.5 g of the substance to be examined and 5 mg of *picotamide impurity A CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture 0.8 volumes of *glacial acetic acid R*, 1 volume of *water R*, 2.5 volumes of *methanol R* and 8 volumes of *butanol R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the principal spot in the chromatogram obtained with reference solution (a) (0.5 per cent) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b) (0.25 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated principal spots.

Chlorides (2.4.4). Dissolve 0.25 g in a mixture of 2.5 ml of *dilute nitric acid R* and 12.5 ml of *water R*. The solution complies with the limit test for chlorides (200 ppm).

Heavy metals (2.4.8). Dissolve 1.0 g by gently heating in a mixture of 15 volumes of *water R* and 85 volumes of *methanol R* and dilute to 20 ml with the same mixture of solvents. 12 ml of the solution complies with limit test B for heavy metals (20 ppm). Prepare the standard, using lead standard solution (1 ppm Pb) obtained by diluting *lead standard solution (100 ppm Pb) R* with a mixture of 15 volumes of *water R* and 85 volumes of *methanol R*.

Water (2.5.12): 4.5 per cent to 5.0 per cent, determined on 0.300 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in a mixture of 20 ml of *anhydrous acetic acid R* and 20 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 18.82 mg of C₂₁H₂₀N₄O₃.

IMPURITIES

A. 4-methoxybenzene-1,3-dicarboxylic acid,

B. 2-methoxy-5-[(pyridin-3-ylmethyl)amino]carbonylbenzoic acid,

C. 4-methoxy-3-[(pyridin-3-ylmethyl)amino]carbonylbenzoic acid,

D. (pyridin-3-yl)methanamine.

01/2005:0633

PILOCARPINE HYDROCHLORIDE

Pilocarpini hydrochloridum

C₁₁H₁₇ClN₂O₂

M_r 244.7

DEFINITION

Pilocarpine hydrochloride contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (3*S*,4*R*)-3-ethyl-4-[(1-methyl-1*H*-imidazol-5-yl)methyl]dihydrofuran-2(3*H*)-one hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder or colourless crystals, hygroscopic, very soluble in water and in alcohol. It melts at about 203 °C.

IDENTIFICATION

First identification: A, B, E.

Second identification: A, C, D, E.

A. It complies with the test for specific optical rotation (see Tests).

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *pilocarpine hydrochloride CRS*. If the substances are examined as discs, prepare using *potassium chloride R*.

- C. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel G plate R*.

Test solution. Dissolve 10 mg in *methanol R* and dilute to 2 ml with the same solvent.

Reference solution. Dissolve 10 mg of *pilocarpine hydrochloride CRS* in *methanol R* and dilute to 2 ml with the same solvent.

Apply to the plate 2 µl of each solution. Develop over a path of 15 cm using a mixture of 1 volume of *concentrated ammonia R*, 14 volumes of *methanol R* and 85 volumes of *methylene chloride R*. Dry the plate at 100–105 °C for 10 min, allow to cool and spray with *dilute potassium iodobismuthate solution R*. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

- D. Dilute 0.2 ml of solution S (see Tests) to 2 ml with *water R*. Add 0.05 ml of a 50 g/l solution of *potassium dichromate R*, 1 ml of *dilute hydrogen peroxide solution R* and 2 ml of *methylene chloride R* and shake. A violet colour develops in the organic layer.

- E. It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 2.50 g in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₇ (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 3.5 to 4.5.

Specific optical rotation (2.2.7): + 89 to + 93, determined on solution S and calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in *water R* and dilute to 100.0 ml with the same solvent.

Reference solution (a). Dilute 5.0 ml of the test solution to 100.0 ml with *water R*. Dilute 2.0 ml of the solution to 20.0 ml with *water R*.

Reference solution (b). Dissolve 5.0 mg of *pilocarpine nitrate for system suitability CRS* in *water R* and dilute to 50.0 ml with the same solvent.

Reference solution (c). To 5 ml of the test solution, add 0.1 ml of *ammonia R* and heat the solution on a water-bath for 30 min, cool and dilute to 25 ml with *water R*. Take 3 ml of this solution and dilute to 25 ml with *water R*. Mainly pilocarpic acid is formed.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R1* (5 µm) with a pore size of 10 nm and a carbon loading of 19 per cent,
- as mobile phase at a flow rate of 1.2 ml/min a solution prepared as follows: mix 55 volumes of *methanol R*, 60 volumes of *acetonitrile R* and 885 volumes of a 0.679 g/l solution of *tetrabutylammonium dihydrogen phosphate R*, previously adjusted to pH 7.7 with *dilute ammonia R2*,
- as detector a spectrophotometer set at 220 nm.

Inject 20 µl of each solution. Continue the chromatography for twice the retention time of the principal component (about 40 min). When the chromatograms are recorded in the prescribed conditions, the substances are eluted in the following sequence: pilocarpic acid, isopilocarpic acid, isopilocarpine and pilocarpine. The test is not valid unless the resolution between the peaks corresponding to isopilocarpine and pilocarpine in the chromatogram obtained with reference solution (b) is at least 1.6. In the chromatogram obtained with the test solution: the area of the peak corresponding to isopilocarpine is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1 per cent); the sum of the areas of the peaks corresponding to isopilocarpine and pilocarpic acid is not greater than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent); and the sum of the areas of any peaks apart from the principal peak and the peaks corresponding to isopilocarpine and pilocarpic acid is not greater than the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Disregard any peak with an area less than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a).

Iron (2.4.9). 10 ml of solution S complies with the limit test for iron (10 ppm). Prepare the standard using 5 ml of *iron standard solution (1 ppm Fe) R* and 5 ml of *water R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 50 ml of *alcohol R* and add 5 ml of 0.01 M *hydrochloric acid*. Titrate with 0.1 M *sodium hydroxide*, determining the end-point potentiometrically (2.2.20). Read the volume added between the two points of inflexion.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 24.47 mg of C₁₁H₁₇ClN₂O₂.

STORAGE

Store in an airtight container, protected from light.

IMPURITIES

- A. (3*R*,4*R*)-3-ethyl-4-[(1-methyl-1*H*-imidazol-5-yl)methyl]dihydrofuran-2(3*H*)-one (isopilocarpine),

- B. R = C₂H₅, R' = H: (2*S*,3*R*)-2-ethyl-3-(hydroxymethyl)-4-(1-methyl-1*H*-imidazol-5-yl)butanoic acid (pilocarpic acid),
- C. R = H, R' = C₂H₅: (2*R*,3*R*)-2-ethyl-3-(hydroxymethyl)-4-(1-methyl-1*H*-imidazol-5-yl)butanoic acid (isopilocarpic acid).

01/2005:0104

PILOCARPINE NITRATE

Pilocarpini nitras

 $C_{11}H_{17}N_3O_5$ M_r 271.3

DEFINITION

Pilocarpine nitrate contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (3*S*,4*R*)-3-ethyl-4-[(1-methyl-1*H*-imidazol-5-yl)methyl]dihydrofuran-2(3*H*)-one nitrate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder or colourless crystals, sensitive to light, freely soluble in water, sparingly soluble in alcohol.

It melts at about 174 °C with decomposition.

IDENTIFICATION

First identification: A, B, E.

Second identification: A, C, D, E.

- A. It complies with the test for specific optical rotation (see Tests).
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *pilocarpine nitrate CRS*.
- C. Examine thin-layer chromatography (2.2.27), using a *TLC silica gel G plate R*.

Test solution. Dissolve 10 mg of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 10 mg of *pilocarpine nitrate CRS* in *water R* and dilute to 10 ml with the same solvent.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 1 volume of *concentrated ammonia R*, 14 volumes of *methanol R* and 85 volumes of *methylene chloride R*. Dry the plate at 100-105 °C for 10 min, allow to cool and spray with *potassium iodobismuthate solution R*. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

- D. Dilute 0.2 ml of solution S (see Tests) to 2 ml with *water R*. Add 0.05 ml of a 50 g/l solution of *potassium dichromate R*, 1 ml of *dilute hydrogen peroxide solution R* and 2 ml of *methylene chloride R* and shake. A violet colour develops in the organic layer.
- E. It gives the reaction of nitrates (2.3.1).

TESTS

Solution S. Dissolve 2.50 g in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent. Prepare immediately before use.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, Method II).

pH (2.2.3). The pH of solution S is 3.5 to 4.5.

Specific optical rotation (2.2.7). + 80 to + 83, determined on solution S and calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in *water R* and dilute to 100.0 ml with the same solvent.

Reference solution (a). Dissolve 5.0 ml of the test solution to 100.0 ml with *water R*. Dilute 2.0 ml of this solution to 20.0 ml with *water R*.

Reference solution (b). Dissolve 5.0 mg of *pilocarpine nitrate for system suitability CRS* in *water R* and dilute to 50.0 ml with the same solvent.

Reference solution (c). To 5 ml of the test solution, add 0.1 ml of *ammonia R* and heat the solution on a water-bath for 30 min, cool and dilute to 25 ml with *water R*. Take 3 ml of this solution and dilute to 25 ml with *water R*. Mainly pilocarpic acid is formed.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R1* (5 µm) with a pore size of 10 nm and a carbon loading of 19 per cent,
- as mobile phase at a flow rate of 1.2 ml/min a solution prepared as follows: mix 55 volumes of *methanol R*, 60 volumes of *acetonitrile R* and 885 volumes of a 0.679 g/l solution of *tetrabutylammonium dihydrogen phosphate R*, previously adjusted to pH 7.7 with *diluted ammonia R2*,
- as detector a spectrophotometer set at 220 nm.

Inject 20 µl of each solution. Continue the chromatography for twice the retention time of the principal peak (about 40 min). When the chromatograms are recorded in the prescribed conditions, the substances are eluted in the following sequence: pilocarpic acid, isopilocarpic acid, isopilocarpine and pilocarpine. The test is not valid unless the resolution between the peaks corresponding to isopilocarpine and pilocarpine in the chromatogram obtained with reference solution (b) is at least 1.6. In the chromatogram obtained with the test solution: the area of the peak corresponding to isopilocarpine is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1 per cent); the sum of the area of the peaks corresponding to isopilocarpine and pilocarpic acid is less than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent); and the sum of the areas of any peaks apart from the principal peak and the peaks corresponding to isopilocarpine and pilocarpic acid is not greater than the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Disregard any peak with an area less than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) and any peak due to the nitrate ion with a relative retention time relative to pilocarpine of about 0.3.

Chlorides (2.4.4). 15 ml of solution S complies with the limit test for chlorides (70 ppm).

Iron (2.4.9). 10 ml of solution S complies with the limit test for iron (10 ppm). Prepare the standard using 5 ml of *iron standard solution* (1 ppm Fe) *R* and 5 ml of *water R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 30 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid* determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 27.13 mg of $C_{11}H_{17}N_3O_5$.

STORAGE

Store protected from light.

IMPURITIES

- A. (3*R*,4*R*)-3-ethyl-4-[(1-methyl-1*H*-imidazol-5-yl)methyl]dihydrofuran-2(3*H*)-one (isopilocarpine),

- B. $R = C_2H_5$, $R' = H$: (2*S*,3*R*)-2-ethyl-3-(hydroxymethyl)-4-(1-methyl-1*H*-imidazol-5-yl)butanoic acid (pilocarpic acid),
 C. $R = H$, $R' = C_2H_5$: (2*R*,3*R*)-2-ethyl-3-(hydroxymethyl)-4-(1-methyl-1*H*-imidazol-5-yl)butanoic acid (isopilocarpic acid).

01/2005:1254

PIMOZIDE

Pimozidum

 $C_{28}H_{29}F_2N_3O$
 M_r 461.6

DEFINITION

Pimozide contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 1-[1-[4,4-bis(4-fluorophenyl)butyl]piperidin-4-yl]-1,3-dihydro-2*H*-benzimidazol-2-one, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, practically insoluble in water, soluble in methylene chloride, sparingly soluble in methanol, slightly soluble in alcohol.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

- A. Melting point (2.2.14): 216 °C to 220 °C.

- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *pimozide CRS*. Examine the substances prepared as discs.

- C. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution. Dissolve 30 mg of the substance to be examined in a mixture of 1 volume of *acetone R* and 9 volumes of *methanol R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dissolve 30 mg of *pimozide CRS* in a mixture of 1 volume of *acetone R* and 9 volumes of *methanol R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dissolve 30 mg of *pimozide CRS* and 30 mg of *benperidol CRS* in a mixture of 1 volume of *acetone R* and 9 volumes of *methanol R* and dilute to 10 ml with the same mixture of solvents.

Apply separately to the plate 10 µl of each solution.

Develop over a path of 15 cm using a mixture of 1 volume of *acetone R* and 9 volumes of *methanol R*. Allow the plate to dry in a current of warm air for 15 min and expose it to iodine vapour until the spots appear. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

- D. Mix about 5 mg with 45 mg of *heavy magnesium oxide R* and ignite in a crucible until an almost white residue is obtained (usually less than 5 min). Allow to cool, add 1 ml of *water R*, 0.05 ml of *phenolphthalein solution R1* and about 1 ml of *dilute hydrochloric acid R* to render the solution colourless. Filter. To a freshly prepared mixture of 0.1 ml of *alizarin S solution R* and 0.1 ml of *zirconyl nitrate solution R*, add 1.0 ml of the filtrate. Mix, allow to stand for 5 min and compare the colour of the solution with that of a blank prepared in the same manner. The test solution is yellow and the blank is red.

TESTS

Appearance of solution. Dissolve 0.2 g in *methanol R* and dilute to 20 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₇ (2.2.2, *Method II*).

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.10 g of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 5.0 mg of *pimozide CRS* and 2.0 mg of *mebendazole CRS* in *methanol R* and dilute to 100.0 ml with the same solvent.

Reference solution (b). Dilute 5.0 ml of the test solution to 100.0 ml with *methanol R*. Dilute 1.0 ml of this solution to 10.0 ml with *methanol R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.1 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (3 µm),

- as mobile phase at a flow rate of 2.0 ml/min:

Mobile phase A. A solution containing 2.5 g/l of *ammonium acetate R* and 8.5 g/l of *tetrabutylammonium hydrogen sulphate R*,

Mobile phase B. *Acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 10	80 → 70	20 → 30	linear gradient
10 - 15	70	30	isocratic elution
15 - 20	80	20	switch to initial eluent composition
20 = 0	80	20	restart gradient

— as detector a spectrophotometer set at 280 nm.

Equilibrate the column for at least 10 min at the initial elution composition.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 10 µl of reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 10 µl of reference solution (a). When the chromatogram is recorded in the prescribed conditions, the retention times are: mebendazole, about 7 min and pimozone, about 8 min. The test is not valid unless the resolution between the peaks due to mebendazole and pimozone is at least 5.0. If necessary, adjust the concentration of acetonitrile in the mobile phase or adjust the time programme for the linear-gradient elution.

Inject separately 10 µl of *methanol R* as a blank, 10 µl of the test solution and 10 µl of reference solution (b). In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum of the areas of all peaks, apart from the principal peak, is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.75 per cent). Disregard any peak in the chromatogram obtained with the blank run and any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Dissolve 0.300 g in 50 ml of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R* and titrate with 0.1 M *perchloric acid*, using 0.2 ml of *naphtholbenzein solution R* as indicator.

1 ml 0.1 M *perchloric acid* is equivalent to 46.16 mg of C₂₈H₂₉F₂N₃O.

STORAGE

Store protected from light.

IMPURITIES

A. 1-(piperidin-4-yl)-1,3-dihydro-2H-benzimidazol-2-one,

B. 1-[1-[(4RS)-4-(4-fluorophenyl)-4-phenylbutyl]piperidin-4-yl]-1,3-dihydro-2H-benzimidazol-2-one,

C. 1-[1-[(4RS)-4-(2-fluorophenyl)-4-(4-fluorophenyl)butyl]piperidin-4-yl]-1,3-dihydro-2H-benzimidazol-2-one,

D. 1-[1-[4,4-bis(4-fluorophenyl)butyl]-1,2,3,6-tetrahydropyridin-4-yl]-1,3-dihydro-2H-benzimidazol-2-one,

E. 1-[1-[4,4-bis(4-fluorophenyl)butyl]piperidin-4-yl]-1-oxide]-1,3-dihydro-2H-benzimidazol-2-one.

01/2005:0634

PINDOLOL

Pindololum

C₁₄H₂₀N₂O₂

M_r 248.3

DEFINITION

Pindolol contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (2RS)-1-(1H-indol-4-yloxy)-3-[(1-methylethyl)amino]propan-2-ol, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, slightly soluble in methanol. It dissolves in dilute mineral acids.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D.

A. Melting point (2.2.14): 169 °C to 174 °C.

B. Dissolve 20.0 mg in a 0.085 per cent V/V solution of *hydrochloric acid R* in *methanol R* and dilute to 100.0 ml with the same solution. Dilute 10.0 ml of the solution to 100.0 ml with a 0.085 per cent V/V solution of *hydrochloric acid R* in *methanol R*. Examined between 230 nm and 320 nm (2.2.25), the solution shows two

absorption maxima, at 264 nm and at 287 nm, and a shoulder at 275 nm. The specific absorbance at the maxima are 330 to 350 and 170 to 190, respectively.

- C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *pindolol CRS*.
- D. Examine in daylight the chromatograms on plate A obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

Appearance of solution. Dissolve 0.5 g in *dilute acetic acid R* and dilute to 10 ml with the same acid. The solution is clear (2.2.1) and not more intensely coloured than reference solution BY₅ or B₅ (2.2.2, *Method II*).

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance. Carry out all operations as rapidly as possible, protected from light.

Test solution (a). Dissolve 0.10 g of the substance to be examined in a mixture of 1 volume of *anhydrous acetic acid R* and 99 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents. Prepare immediately before use and apply this solution to the plate last.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with a mixture of 1 volume of *anhydrous acetic acid R* and 99 volumes of *methanol R*.

Reference solution (a). Dissolve 20 mg of *pindolol CRS* in a mixture of 1 volume of *anhydrous acetic acid R* and 99 volumes of *methanol R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dilute 1.5 ml of reference solution (a) to 50 ml with a mixture of 1 volume of *anhydrous acetic acid R* and 99 volumes of *methanol R*.

- A. Apply separately 5 µl of each solution. Develop the plate without delay over a path of 10 cm using a freshly prepared mixture of 4 volumes of *concentrated ammonia R*, 50 volumes of *ethyl acetate R* and 50 volumes of *methanol R*. Dry the plate briefly in a current of cold air. Spray the plate without delay with *dimethylaminobenzaldehyde solution R7* and heat to 50 °C for 20 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.3 per cent).
- B. Apply separately 10 µl of each solution. Develop the plate without delay over a path of 10 cm using a freshly prepared mixture of 4 volumes of *concentrated ammonia R*, 50 volumes of *ethyl acetate R* and 50 volumes of *methanol R*. Dry the plate briefly in a current of cold air. Examine the plate without delay in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot and the spots detected on plate A, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.3 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 80 ml of *methanol R*. Titrate with 0.1 M *hydrochloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *hydrochloric acid* is equivalent to 24.83 mg of C₁₄H₂₀N₂O₂.

STORAGE

Store protected from light.

IMPURITIES

- A. 1-[[7-[2-hydroxy-3-[(1-methylethyl)amino]propyl]-1H-indol-4-yl]oxy]-3-[(1-methylethyl)amino]propan-2-ol,

- B. 1-[4-[2-hydroxy-3-[(1-methylethyl)amino]propoxy]-1H-indol-1-yl]-3-[(1-methylethyl)amino]propan-2-ol,

- C. 1,1'-(1-methylethyl)imino]bis[3-(1H-indol-4-yloxy)propan-2-ol],

- D. R = OH: (2RS)-3-(1H-indol-4-yloxy)propane-1,2-diol,

- F. R = Cl: (2RS)-1-chloro-3-(1H-indol-4-yloxy)propan-2-ol,

- E. 1H-indol-4-ol.

01/2005:1743

PIPEMIDIC ACID TRIHYDRATE

Acidum pipemidicum trihydricum

C₁₄H₁₇N₅O₃·3H₂O

M_r 357.4

DEFINITION

8-Ethyl-5-oxo-2-(piperazin-1-yl)-5,8-dihydropyrido[2,3-*d*]pyrimidine-6-carboxylic acid trihydrate.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: pale yellow or yellow, crystalline powder.

Solubility: very slightly soluble in water. It dissolves in dilute solutions of acids and of alkali hydroxides.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of pipemidic acid trihydrate.

TESTS

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 20 mg of the substance to be examined in 10 ml of the mobile phase and dilute to 20.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (a). Dilute 2.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 10.0 mg of *ethyl parahydroxybenzoate R* in 2.0 ml of the test solution and dilute to 20.0 ml with the mobile phase.

Column:

- *size*: $l = 0.15$ m, $\varnothing = 4.6$ mm,
- *stationary phase*: octadecylsilyl silica gel for chromatography R1 (5 μ m) with a pore size of 18 nm and a carbon loading of 13 per cent.

Mobile phase: mix 20 volumes of *acetonitrile R*, 20 volumes of *methanol R* and 60 volumes of a solution containing 5.7 g/l of *citric acid R* and 1.7 g/l of *sodium decanesulphonate R*.

Flow rate: 0.8 ml/min.

Detection: spectrophotometer at 275 nm.

Injection: 20 μ l.

Run time: 2.5 times the retention time of pipemidic acid.

System suitability: reference solution (b):

- *resolution*: minimum 4.0 between the peaks due to pipemidic acid and to ethyl parahydroxybenzoate.

Limits:

- *any impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),
- *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent),
- *disregard limit*: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test C. Prepare the standard using 2.0 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32): 14.0 per cent to 16.0 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.240 g in 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 30.33 mg of $C_{14}H_{17}N_5O_3$.

STORAGE

Protected from light.

IMPURITIES

- A. R1 = H, R2 = OH: 8-ethyl-2-hydroxy-5-oxo-5,8-dihydropyrido[2,3-*d*]pyrimidine-6-carboxylic acid,
 B. R1 = H, R2 = OCH₃: 8-ethyl-2-methoxy-5-oxo-5,8-dihydropyrido[2,3-*d*]pyrimidine-6-carboxylic acid,
 C. R1 = H, R2 = OC₂H₅: 2-ethoxy-8-ethyl-5-oxo-5,8-dihydropyrido[2,3-*d*]pyrimidine-6-carboxylic acid,
 D. R1 = C₂H₅, R2 = Cl: ethyl 2-chloro-8-ethyl-5-oxo-5,8-dihydropyrido[2,3-*d*]pyrimidine-6-carboxylate,

- E. R1 = C₂H₅, R2 = H: ethyl 8-ethyl-5-oxo-2-(piperazin-1-yl)-5,8-dihydropyrido[2,3-*d*]pyrimidine-6-carboxylate,
 F. R1 = H, R2 = CO-CH₃: 2-(4-acetyl)piperazin-1-yl)-8-ethyl-5-oxo-5,8-dihydropyrido[2,3-*d*]pyrimidine-6-carboxylic acid (acetyl pipemidic acid).

01/2005:1169

PIPERACILLIN

Piperacillinum

$C_{23}H_{27}N_5O_7S \cdot H_2O$

M_r 535.6

DEFINITION

Piperacillin contains not less than 96.0 per cent and not more than the equivalent of 101.0 per cent of (2*S*,5*R*,6*R*)-6-[[[(2*R*)-2-[[[(4-ethyl-2,3-dioxopiperazin-1-yl)carbonyl]amino]-2-phenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white powder, slightly soluble in water, freely soluble in methanol, slightly soluble in ethyl acetate.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *piperacillin CRS*.

TESTS

Solution S. Dissolve 2.50 g in *sodium carbonate solution R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension II (2.2.1). The absorbance of solution S measured at 430 nm (2.2.25) is not greater than 0.10.

Specific optical rotation (2.2.7). Dissolve 0.250 g in *methanol R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 165 to + 175, calculated with reference to the anhydrous substance.

Related substances. Examine by liquid chromatography (2.2.29) as prescribed under Assay. Inject 20 µl of reference solution (b) and elute isocratically with the chosen mobile phase. Inject 20 µl of test solution (b). Start the elution isocratically. Immediately after elution of the piperacillin peak start the following linear gradient.

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 30	88 → 0	12 → 100	linear gradient
30 - 45	0 → 88	100 → 12	re-equilibration

In the chromatogram obtained with test solution (b), the area of any peak, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2 per cent). Disregard any peak due to the solvent.

N,N-Dimethylaniline (2.4.26, *Method A*). Not more than 20 ppm.

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) *R*.

Water (2.5.12): 2.0 per cent to 4.0 per cent, determined on 0.500 g by the semi-micro determination of water.

ASSAY

Examine by liquid chromatography (2.2.29).

Solvent mixture. Mix 25 volumes of *acetonitrile R* and 75 volumes of a 31.2 g/l solution of *sodium dihydrogen phosphate R*.

Test solution (a). Dissolve 25.0 mg of the substance to be examined in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Test solution (b). Prepare the solution immediately before use. Dissolve 40.0 mg of the substance to be examined in the solvent mixture and dilute to 20.0 ml with the solvent mixture.

Reference solution (a). Dissolve 25.0 mg of *piperacillin CRS* in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 25.0 ml with the solvent mixture.

Reference solution (c). Dissolve 10.0 mg of *piperacillin CRS* and 10.0 mg of *anhydrous ampicillin CRS* in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (d). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 50.0 ml with the solvent mixture.

The chromatographic procedure may be carried out using:

- a column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.0 ml/min a mixture of 88 volumes of mobile phase A and 12 volumes of mobile phase B:

Mobile phase A. Mix 576 ml of *water R*, 200 ml of a 31.2 g/l solution of *sodium dihydrogen phosphate R* and 24 ml of an 80 g/l solution of *tetrabutylammonium hydroxide R*. If necessary, adjust to pH 5.5 with *dilute phosphoric acid R* or *dilute sodium hydroxide solution R*; then add 200 ml of *acetonitrile R*,

Mobile phase B. Mix 126 ml of *water R*, 200 ml of a 31.2 g/l solution of *sodium dihydrogen phosphate R* and 24 ml of an 80 g/l solution of *tetrabutylammonium hydroxide R*. If necessary, adjust to pH 5.5 with *dilute phosphoric acid R* or *dilute sodium hydroxide solution R*; then add 650 ml of *acetonitrile R*,

- as detector a spectrophotometer set at 220 nm.

Inject 20 µl of reference solution (c). The test is not valid unless in the chromatogram obtained, the resolution between the peaks corresponding to ampicillin and to piperacillin is at least 10 (if necessary, adjust the ratio A:B of the mobile phase) and the mass distribution ratio for the second peak (piperacillin) is 2.0 to 3.0. Inject 20 µl of reference solution (d). Adjust the sensitivity of the system to obtain a peak with a signal-to-noise ratio of at least 3. Inject reference solution (a) 6 times. The test is not valid unless the relative standard deviation of the peak area of piperacillin is at most 1.0 per cent. Inject alternately test solution (a) and reference solution (a).

IMPURITIES

A. ampicillin,

- B. R1 = CO₂H, R2 = H: (4S)-2-[carboxy[[[(2R)-2-[(4-ethyl-2,3-dioxopiperazin-1-yl)carbonyl]amino]-2-phenylacetyl]amino]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid (penicilloic acids of piperacillin),
- C. R1 = R2 = H: (2RS,4S)-2-[[[(2R)-2-[(4-ethyl-2,3-dioxopiperazin-1-yl)carbonyl]amino]-2-phenylacetyl]amino]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid (penilloic acids of piperacillin),
- F. R1 = CO₂H, R2 = CO-CH₃: (4S)-3-acetyl-2-[carboxy[[[(2R)-2-[(4-ethyl-2,3-dioxopiperazin-1-yl)carbonyl]amino]-2-phenylacetyl]amino]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid (acetylated penicilloic acids of piperacillin),

D. (2*S*,5*R*,6*R*)-6-[[[(2*R*)-2-[[[(2*S*,5*R*,6*R*)-6-[(2*R*)-2-[(4-ethyl-2,3-dioxopiperazin-1-yl)carbonyl]amino]-2-phenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]hept-2-yl]carbonyl]amino]-2-phenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (piperacillinylampicillin),

E. 1-ethylpiperazine-2,3-dione.

01/2005:1168

PIPERACILLIN SODIUM

Piperacillinum natricum

$C_{23}H_{26}N_5NaO_7S$

M_r 539.5

DEFINITION

Piperacillin sodium contains not less than 95.0 per cent and not more than the equivalent of 101.0 per cent of sodium (2*S*,5*R*,6*R*)-6-[[[(2*R*)-2-[(4-ethyl-2,3-dioxopiperazin-1-yl)carbonyl]amino]-2-phenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white powder, hygroscopic, freely soluble in water and in methanol, practically insoluble in ethyl acetate.

IDENTIFICATION

A. Dissolve 0.250 g in *water R*, add 0.5 ml of *dilute hydrochloric acid R* and 5 ml of *ethyl acetate R*; stir and allow to stand for 10 min in iced water. Filter the crystals through a small sintered-glass filter (40), applying suction. Wash with 5 ml of *water R* and 5 ml of *ethyl acetate R* and dry in an oven at 60 °C for 60 min. Examine the crystals by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *piperacillin CRS*.

B. It gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 2.50 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1). The absorbance of solution S measured at 430 nm (2.2.25) is not greater than 0.10.

pH (2.2.3). The pH of solution S is 5.0 to 7.0.

Specific optical rotation (2.2.7). Dissolve 0.250 g in *water R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 175 to + 190, calculated with reference to the anhydrous substance.

Related substances. Examine by liquid chromatography (2.2.29) as prescribed under Assay. Inject 20 µl of reference solution (b) and elute isocratically with the chosen mobile phase. Inject 20 µl of test solution (b). Start the elution isocratically. Immediately after elution of the piperacillin peak start the following linear gradient.

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 30	88 → 0	12 → 100	linear gradient
30 - 45	0 → 88	100 → 12	re-equilibration

In the chromatogram obtained with test solution (b), the area of any peak, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2 per cent). Disregard any peak due to the solvent.

***N,N*-Dimethylaniline** (2.4.26, *Method A*). Not more than 20 ppm.

Heavy metals (2.4.8). 1.0 g complies with the limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) *R*.

Water (2.5.12). Not more than 2.0 per cent, determined on 0.500 g by the semi-micro determination of water.

Bacterial endotoxins (2.6.14): less than 0.07 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Examine by liquid chromatography (2.2.29).

Solvent mixture. Mix 25 volumes of *acetonitrile R* and 75 volumes of a 31.2 g/l solution of *sodium dihydrogen phosphate R*.

Test solution (a). Dissolve 25.0 mg of the substance to be examined in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Test solution (b). Prepare the solution immediately before use. Dissolve 40.0 mg of the substance to be examined in the solvent mixture and dilute to 20.0 ml with the solvent mixture.

Reference solution (a). Dissolve 25.0 mg of *piperacillin CRS* in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 25.0 ml with the solvent mixture.

Reference solution (c). Dissolve 10.0 mg of *piperacillin CRS* and 10.0 mg of *anhydrous ampicillin CRS* in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (d). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the solvent mixture. Dilute 1.0 ml of the solution to 50.0 ml with the solvent mixture.

The chromatographic procedure may be carried out using:

- a column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.0 ml/min a mixture of 88 volumes of mobile phase A and 12 volumes of mobile phase B:

Mobile phase A. Mix 576 ml of *water R*, 200 ml of a 31.2 g/l solution of *sodium dihydrogen phosphate R* and 24 ml of a 80 g/l solution of *tetrabutylammonium hydroxide R*. If necessary, adjust to pH 5.5 with *dilute phosphoric acid R* or *dilute sodium hydroxide solution R*; then add 200 ml of *acetonitrile R*,

Mobile phase B. Mix 126 ml of *water R*, 200 ml of a 31.2 g/l solution of *sodium dihydrogen phosphate R* and 24 ml of a 80 g/l solution of *tetrabutylammonium hydroxide R*. If necessary, adjust to pH 5.5 with *dilute phosphoric acid R* or *dilute sodium hydroxide solution R*; then add 650 ml of *acetonitrile R*,

- as detector a spectrophotometer set at 220 nm.

Inject 20 µl of reference solution (c). The test is not valid unless in the chromatogram obtained, the resolution between the peaks corresponding to ampicillin and to piperacillin is at least ten (if necessary, adjust the A:B ratio of the mobile phase) and the mass distribution ratio for the second peak (piperacillin) is 2.0 to 3.0. Inject 20 µl of reference solution (d). Adjust the sensitivity of the system to obtain a peak with a signal-to-noise ratio of at least 3. Inject reference solution (a) six times. The test is not valid unless the relative standard deviation of the peak area of piperacillin is at most 1.0 per cent. Inject alternately test solution (a) and reference solution (a).

Calculate the percentage content of piperacillin sodium multiplying the result by 1.042.

STORAGE

Store in an airtight container. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

Specified impurities: A, B, C, D, E, F, G.

Other detectable impurities: H.

A. ampicillin,

B. R1 = CO₂H, R2 = H: (4S)-2-[carboxy[[[(2R)-2-[(4-ethyl-2,3-dioxopiperazin-1-yl)carbonyl]amino]-2-phenylacetyl]amino]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid (penicilloic acids of piperacillin),

C. R1 = R2 = H: (2RS,4S)-2-[[[(2R)-2-[(4-ethyl-2,3-dioxopiperazin-1-yl)carbonyl]amino]-2-phenylacetyl]amino]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid (penilloic acids of piperacillin),

F. R1 = CO₂H, R2 = CO-CH₃: (4S)-3-acetyl-2-[carboxy[[[(2R)-2-[(4-ethyl-2,3-dioxopiperazin-1-yl)carbonyl]amino]-2-phenylacetyl]amino]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid (acetylated penicilloic acids of piperacillin).

D. (2S,5R,6R)-6-[[[(2R)-2-[[[(2S,5R,6R)-6-[[[(2R)-2-[(4-ethyl-2,3-dioxopiperazin-1-yl)carbonyl]amino]-2-phenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]hept-2-yl]carbonyl]amino]-2-phenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (piperacillinylampicillin),

E. 1-ethylpiperazine-2,3-dione,

G. (2R)-2-[[[(4-ethyl-2,3-dioxopiperazin-1-yl)carbonyl]amino]-2-phenylacetic acid,

H. (2S,5R,6R)-6-amino-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (6-aminopenicillanic acid).

01/2005:0423

PIPERAZINE ADIPATE

Piperazini adipas

C₁₀H₂₀N₂O₄

M_r 232.3

DEFINITION

Piperazine adipate contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of piperazine hexanedioate, calculated with reference to the anhydrous substance.

CHARACTERS

A white crystalline powder, soluble in water, practically insoluble in alcohol. It melts at about 250 °C, with decomposition.

IDENTIFICATION

First identification: A.

Second identification: B, C.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *piperazine adipate CRS*. Examine the substances prepared as discs.
- B. Examine the chromatograms obtained in the test for related substances after spraying with the ninhydrin solutions. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- C. To 10 ml of solution S (see Tests) add 5 ml of *hydrochloric acid R* and shake with three quantities, each of 10 ml, of *ether R*. Evaporate the combined ether layers to dryness. The residue, washed with 5 ml of *water R* and dried at 100 °C to 105 °C, melts (2.2.14) at 150 °C to 154 °C.

TESTS

Solution S. Dissolve 2.5 g in *water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution B₈ (2.2.2, *Method II*).

Related substances. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution (a). Dissolve 1.0 g of the substance to be examined in 6 ml of *concentrated ammonia R* and dilute to 10 ml with *ethanol R*.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with a mixture of 2 volumes of *ethanol R* and 3 volumes of *concentrated ammonia R*.

Reference solution (a). Dissolve 0.1 g of *piperazine adipate CRS* in a mixture of 2 volumes of *ethanol R* and 3 volumes of *concentrated ammonia R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dissolve 25 mg of *ethylenediamine R* in a mixture of 2 volumes of *ethanol R* and 3 volumes of *concentrated ammonia R* and dilute to 100 ml with the same mixture of solvents.

Reference solution (c). Dissolve 25 mg of *triethylenediamine R* in a mixture of 2 volumes of *ethanol R* and 3 volumes of *concentrated ammonia R* and dilute to 100 ml with the same mixture of solvents.

Reference solution (d). Dissolve 12.5 mg of *triethylenediamine R* in 5.0 ml of test solution (a) and dilute to 50 ml with a mixture of 2 volumes of *ethanol R* and 3 volumes of *concentrated ammonia R*.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a freshly prepared mixture of 20 volumes of *concentrated ammonia R* and 80 volumes of *acetone R*. Dry the plate at 105 °C and spray successively with a 3 g/l solution of *ninhydrin R* in a mixture of 3 volumes of *anhydrous acetic acid R* and 100 volumes of *butanol R* and a 1.5 g/l solution of *ninhydrin R* in *ethanol R*. Dry the plate at 105 °C for 10 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.25 per cent). Spray the plate with 0.05 M *iodine* and allow to stand for about

10 min. Any spot corresponding to triethylenediamine in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (c) (0.25 per cent). The test is not valid unless the chromatogram obtained with reference solution (d) shows two clearly separated spots. Disregard any spots remaining on the starting line.

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Water (2.5.12). Not more than 0.5 per cent, determined on 1.00 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in 10 ml of *anhydrous acetic acid R* with gentle heating and dilute to 70 ml with the same acid. Titrate with 0.1 M *perchloric acid* using 0.25 ml of *naphtholbenzein solution R* as indicator until the colour changes from brownish-yellow to green.

1 ml of 0.1 M *perchloric acid* is equivalent to 11.61 mg of C₁₀H₂₀N₂O₄.

01/2005:0424

PIPERAZINE CITRATE

Piperazini citras

C₂₄H₄₆N₆O₁₄·xH₂OM_r 643 (anhydrous substance)

DEFINITION

Piperazine citrate contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of tripiperazine bis(2-hydroxy-propane-1,2,3-tricarboxylate), calculated with reference to the anhydrous substance. It contains a variable quantity of water.

CHARACTERS

A white granular powder, freely soluble in water, practically insoluble in alcohol.

After drying at 100 °C to 105 °C, it melts at about 190 °C.

IDENTIFICATION

First identification: A.

Second identification: B, C.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *piperazine citrate CRS*. Dry the substance to be examined and the reference substance at 120 °C for 5 h, powder the substances avoiding uptake of water, prepare discs and record the spectra without delay.
- B. Examine the chromatograms obtained in the test for related substances after spraying with the ninhydrin solutions. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- C. Dissolve 0.5 g in *water R* and dilute to 5 ml with the same solvent. The solution gives the reaction of citrates (2.3.1).

TESTS

01/2005:0425

Solution S. Dissolve 1.25 g in *water R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution B₈ (2.2.2, Method II).

Related substances. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution (a). Dissolve 1.0 g of the substance to be examined in 6 ml of *concentrated ammonia R* and dilute to 10 ml with *ethanol R*.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with a mixture of 2 volumes of *ethanol R* and 3 volumes of *concentrated ammonia R*.

Reference solution (a). Dissolve 0.1 g of *piperazine citrate CRS* in a mixture of 2 volumes of *ethanol R* and 3 volumes of *concentrated ammonia R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dissolve 25 mg of *ethylenediamine R* in a mixture of 2 volumes of *ethanol R* and 3 volumes of *concentrated ammonia R* and dilute to 100 ml with the same mixture of solvents.

Reference solution (c). Dissolve 25 mg of *triethylenediamine R* in a mixture of 2 volumes of *ethanol R* and 3 volumes of *concentrated ammonia R* and dilute to 100 ml with the same mixture of solvents.

Reference solution (d). Dissolve 12.5 mg of *triethylenediamine R* in 5.0 ml of test solution (a) and dilute to 50 ml with a mixture of 2 volumes of *ethanol R* and 3 volumes of *concentrated ammonia R*.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a freshly prepared mixture of 20 volumes of *concentrated ammonia R* and 80 volumes of *acetone R*. Dry the plate at 105 °C and spray successively with a 3 g/l solution of *ninhydrin R* in a mixture of 3 volumes of *anhydrous acetic acid R* and 100 volumes of *butanol R* and a 1.5 g/l solution of *ninhydrin R* in *ethanol R*. Dry the plate at 105 °C for 10 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.25 per cent). Spray the plate with 0.05 M *iodine* and allow to stand for about 10 min. Any spot corresponding to triethylenediamine in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (c) (0.25 per cent). The test is not valid unless the chromatogram obtained with reference solution (d) shows two clearly separated spots. Disregard any spots remaining on the starting line.

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution* (1 ppm Pb) R.

Water (2.5.12). 10.0 per cent to 14.0 per cent, determined on 0.300 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in 10 ml of *anhydrous acetic acid R* with gentle heating and dilute to 70 ml with the same acid. Titrate with 0.1 M *perchloric acid* using 0.25 ml of *naphtholbenzein solution R* as indicator until the colour changes from brownish-yellow to green.

1 ml of 0.1 M *perchloric acid* is equivalent to 10.71 mg of C₂₄H₄₆N₆O₁₄.

PIPERAZINE HYDRATE

Piperazinum hydricum

C₄H₁₀N₂·6H₂OM_r 194.2

DEFINITION

Piperazine hydrate contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of piperazine hexahydrate.

CHARACTERS

Colourless, deliquescent crystals, freely soluble in water and in alcohol.

It melts at about 43 °C.

IDENTIFICATION

First identification: A.

Second identification: B, C.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *piperazine hydrate CRS*. Dry the substance to be examined and the reference substance over *diphosphorus pentoxide R in vacuo* for 48 h, powder the substances avoiding uptake of water, prepare discs and record the spectra without delay.
- B. Examine the chromatograms obtained in the test for related substances after spraying with the ninhydrin solutions. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- C. Dissolve 0.5 g in 5 ml of *dilute sodium hydroxide solution R*. Add 0.2 ml of *benzoyl chloride R* and mix. Continue to add *benzoyl chloride R* in portions of 0.2 ml until no further precipitate is formed. Filter and wash the precipitate with a total of 10 ml of *water R* added in small portions. Dissolve the precipitate in 2 ml of hot *alcohol R* and pour the solution into 5 ml of *water R*. Allow to stand for 4 h, filter, wash the crystals with *water R* and dry at 100 °C to 105 °C. The crystals melt (2.2.14) at 191 °C to 196 °C.

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution B₈ (2.2.2, Method II).

pH (2.2.3). The pH of solution S is 10.5 to 12.0.

Related substances. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution (a). Dissolve 1.0 g of the substance to be examined in 6 ml of *concentrated ammonia R* and dilute to 10 ml with *ethanol R*.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with a mixture of 2 volumes of *ethanol R* and 3 volumes of *concentrated ammonia R*.

Reference solution (a). Dissolve 0.1 g of *piperazine hydrate CRS* in a mixture of 2 volumes of *ethanol R* and 3 volumes of *concentrated ammonia R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dissolve 25 mg of *ethylenediamine R* in a mixture of 2 volumes of *ethanol R* and 3 volumes of *concentrated ammonia R* and dilute to 100 ml with the same mixture of solvents.

Reference solution (c). Dissolve 25 mg of *triethylenediamine R* in a mixture of 2 volumes of *ethanol R* and 3 volumes of *concentrated ammonia R* and dilute to 100 ml with the same mixture of solvents.

Reference solution (d). Dissolve 12.5 mg of *triethylenediamine R* in 5.0 ml of test solution (a) and dilute to 50 ml with a mixture of 2 volumes of *ethanol R* and 3 volumes of *concentrated ammonia R*.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a freshly prepared mixture of 20 volumes of *concentrated ammonia R* and 80 volumes of *acetone R*. Dry the plate at 105 °C and spray successively with a 3 g/l solution of *ninhydrin R* in a mixture of 3 volumes of *anhydrous acetic acid R* and 100 volumes of *butanol R* and a 1.5 g/l solution of *ninhydrin R* in *ethanol R*. Dry the plate at 105 °C for 10 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.25 per cent). Spray the plate with 0.05 M *iodine* and allow to stand for about 10 min. Any spot corresponding to triethylenediamine in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (c) (0.25 per cent). The test is not valid unless the chromatogram obtained with reference solution (d) shows two clearly separated spots.

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 80.0 mg in 10 ml of *anhydrous acetic acid R* with gentle heating and dilute to 70 ml with the same acid. Titrate with 0.1 M *perchloric acid* using 0.25 ml of *naphtholbenzein solution R* as indicator until the colour changes from brownish-yellow to green.

1 ml of 0.1 M *perchloric acid* is equivalent to 9.705 mg of C₆H₁₀N₂O₂.

STORAGE

Store in an airtight container, protected from light.

01/2005:1733

PIRACETAM

Piracetamum

C₆H₁₀N₂O₂

*M*_r 142.2

DEFINITION

2-(2-Oxopyrrolidin-1-yl)acetamide.

Content: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: freely soluble in water, soluble in alcohol.

It shows polymorphism.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: *piracetam CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *alcohol R*, evaporate to dryness on a water-bath and record new spectra using the residues.

TESTS

Appearance of solution. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Dissolve 2.0 g in *water R* and dilute to 10 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in a mixture of 10 volumes of *acetonitrile R* and 90 volumes of *water R* and dilute to 100.0 ml with the same mixture of solvents.

Reference solution (a). Dissolve 5 mg of the substance to be examined and 10 mg of *2-pyrrolidone R* in a mixture of 10 volumes of *acetonitrile R* and 90 volumes of *water R* and dilute to 100.0 ml with the same mixture of solvents.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with a mixture of 10 volumes of *acetonitrile R* and 90 volumes of *water R*. Dilute 5.0 ml to 50.0 ml with a mixture of 10 volumes of *acetonitrile R* and 90 volumes of *water R*.

Column:

- **size:** *l* = 0.25 m, Ø = 4.6 mm,
- **stationary phase:** end-capped octadecylsilyl silica gel for chromatography R (5 µm).

Mobile phase: mix 10 volumes of *acetonitrile R* and 90 volumes of a 1.0 g/l solution of *dipotassium hydrogen phosphate R*, adjust to pH 6.0 with *dilute phosphoric acid R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 205 nm.

Injection: 20 µl.

Run time: 8 times the retention time of piracetam.

Retention time: piracetam = about 4 min.

System suitability: reference solution (a):

- **resolution:** minimum 3.0 between the peaks due to piracetam and impurity A.
- **symmetry factor:** maximum 2.0 for the peak due to piracetam.

Limits:

- **any impurity:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- **total:** not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent),
- **disregard limit:** half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.4.8): maximum 10 ppm.

Dissolve 2 g in 20 ml of *water R*. 12 ml of the solution complies with limit test A. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.750 g in 50 ml of *carbon dioxide-free water R*. Add 20.0 ml of 1 M *sodium hydroxide* and heat to boiling for 15 min. Allow to cool and add 25.0 ml of 1 M *hydrochloric acid*. Heat to boiling for 2 min and allow to cool. Add 0.1 ml of *phenolphthalein solution R1*. Titrate with 1 M *sodium hydroxide* until a pink colour is obtained.

1 ml of 1 M *sodium hydroxide* is equivalent to 142.2 mg of $C_{19}H_{23}Cl_2N_5O_2 \cdot H_2O$.

STORAGE

Protected from light.

IMPURITIES

- A. R = H: pyrrolidin-2-one (2-pyrrolidone),
 B. R = CH_2COOCH_3 : methyl (2-oxopyrrolidin-1-yl)acetate,
 C. R = $CH_2COOC_2H_5$: ethyl (2-oxopyrrolidin-1-yl)acetate,
 D. R = CH_2CO_2H : (2-oxopyrrolidin-1-yl)acetic acid.

01/2005:2001

PIRENZEPINE DIHYDROCHLORIDE MONOHYDRATE

Pirenzepini dihydrochloridum monohydricum

$C_{19}H_{23}Cl_2N_5O_2 \cdot H_2O$

M_r 442.3

DEFINITION

11-[(4-Methylpiperazin-1-yl)acetyl]-5,11-dihydro-6H-pyrido[2,3-b][1,4]benzodiazepin-6-one dihydrochloride monohydrate.

Content: 98.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or yellowish, crystalline powder.

Solubility: freely soluble in water, slightly soluble in methanol, very slightly soluble in ethanol, practically insoluble in methylene chloride.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

- A. Dissolve 30.0 mg in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml of the solution to 100.0 ml with *methanol R*. Examined between 240 nm

and 360 nm (2.2.25), the solution shows an absorption maximum at 283 nm. The specific absorbance at the maximum is 190 to 205 (anhydrous substance).

- B. Infrared absorption spectrophotometry (2.2.24).

Comparison: *pirenzepine dihydrochloride monohydrate CRS*.

- C. Examine the chromatograms obtained in the test for impurity D.

Results: the principal band obtained in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal band in the chromatogram obtained with reference solution (d).

- D. To 0.2 ml of solution S (see Tests) add 1.8 ml of *water R*. The solution gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution GY₅ (2.2.2, *Method II*).

pH (2.2.3): 1.0 to 2.0 for solution S.

Impurity D. Thin-layer chromatography (2.2.27).

Test solution (a). To 0.10 g add 0.1 ml of *concentrated ammonia R* and dilute to 10 ml with *methanol R*.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methanol R*.

Reference solution (a). To 0.1 g of *pirenzepine dihydrochloride monohydrate CRS* add 0.1 ml of *concentrated ammonia R* and dilute to 10 ml with *methanol R*.

Reference solution (b). Dissolve 25 mg of *methylpiperazine R* in *methanol R* and dilute to 25 ml with the same solvent. Dilute 2.0 ml of the solution to 100 ml with *methanol R*.

Reference solution (c). Dilute 5 ml of test solution (a) to 100 ml with *methanol R*. Dilute 4 ml of this solution to 100 ml with *methanol R*. Mix 1 ml with 1 ml of reference solution (b).

Reference solution (d). Dilute 1 ml of reference solution (a) to 10 ml with *methanol R*.

Plate: TLC silica gel plate R.

Mobile phase: *concentrated ammonia R*, *methanol R*, *ethyl acetate R*, *toluene R* (7:25:28:40 V/V/V/V).

Application: 20 µl as bands of 20 mm by 2 mm.

Development: over 2/3 of the plate.

Drying: in air.

Detection: expose the plate to iodine vapour until the band in the chromatogram obtained with reference solution (b) is clearly visible (at most 60 min).

System suitability: the test is not valid unless the chromatogram obtained with reference solution (c) shows 2 clearly separated bands.

Limit:

- **impurity D:** any band corresponding to impurity D in the chromatogram obtained with test solution (a) is not more intense than the band in the chromatogram obtained with reference solution (b) (0.2 per cent).

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.30 g of the substance to be examined in *water R* and dilute to 10.0 ml with the same solvent. To 1.0 ml of the solution add 5 ml of *methanol R* and dilute to 10.0 ml with mobile phase A.

Reference solution (a). Dilute 2.0 ml of the test solution to 100.0 ml with mobile phase A. Dilute 1.0 ml of this solution to 10.0 ml with mobile phase A.

Reference solution (b). Dissolve 0.1 g of 1-phenylpiperazine *R* in methanol *R* and dilute to 10 ml with the same solvent. Mix 1 ml of the solution with 1 ml of the test solution, add 5 ml of methanol *R* and dilute to 10 ml with mobile phase A.

Column:

- **size:** $l = 0.125$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** octadecylsilyl silica gel for chromatography *R* (5 μ m).

Mobile phase:

- **mobile phase A:** dissolve 2.0 g of sodium dodecyl sulphate *R* in water *R*, adjust to pH 3.2 with acetic acid *R* and dilute to 1000 ml with water *R*,
- **mobile phase B:** methanol *R*,
- **mobile phase C:** acetonitrile *R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Mobile phase C (per cent V/V)
0 - 15	55 → 25	30	15 → 45
15 - 18	25 → 20	30 → 0	45 → 80
18 - 20	20 → 55	0 → 30	80 → 15
20 - 25	55	30	15

Flow rate: 1 ml/min.

Detection: spectrophotometer at 283 nm.

Injection: 10 μ l.

System suitability: reference solution (b):

- **resolution:** minimum of 5.0 between the peaks corresponding to pirenzepine and to 1-phenylpiperazine.

Limits:

- **any impurity:** not more than the peak area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),
- **total:** not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- **disregard limit:** 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.04 per cent).

Water (2.5.12): 3.5 per cent to 5.0 per cent, determined on 0.250 g.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 50 ml of water *R*. Carry out a potentiometric titration (2.2.20), using 0.1 *M* sodium hydroxide. Read the volume at the first point of inflection.

1 ml of 0.1 *M* sodium hydroxide is equivalent to 42.43 mg of $C_{19}H_{23}Cl_2N_5O_2$.

STORAGE

Protected from light.

IMPURITIES

A. R = CO-CH₂-Cl: 11-(chloroacetyl)-5,11-dihydro-6*H*-pyrido[2,3-*b*][1,4]benzodiazepin-6-one,

B. R = H: 5,11-dihydro-6*H*-pyrido[2,3-*b*][1,4]benzodiazepin-6-one,

C. 6-[[[(4-methylpiperazin-1-yl)acetyl]amino]-11*H*-pyrido[2,1-*b*]quinazolin-11-one,

D. 1-methylpiperazine.

01/2005:1556

PIRETANIDE

Piretanidum

$C_{17}H_{18}N_2O_5S$

M_r 362.4

DEFINITION

Piretanide contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 4-phenoxy-3-(pyrrolidin-1-yl)-5-sulphamoylbenzoic acid, calculated with reference to the dried substance.

CHARACTERS

A yellowish-white to yellowish powder, very slightly soluble in water, sparingly soluble in ethanol.

It shows polymorphism.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *piretanide CRS*. Examine the substances prepared as discs. If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in acetone *R*, evaporate to dryness and record new spectra using the residues.

TESTS

Appearance of solution. Dissolve 0.1 g in *methanol R* and dilute to 10 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution GY₄ (2.2.2, *Method II*).

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 20 mg of the substance to be examined in a mixture of 10 volumes of *ethanol R*, 45 volumes of *acetonitrile R* and 45 volumes of *water R* and dilute to 20.0 ml with the same mixture of solvents.

Reference solution (a). Dissolve 10 mg of *piretanide CRS* and 3 mg of *piretanide impurity A CRS* in a mixture of 10 volumes of *ethanol R*, 45 volumes of *acetonitrile R* and 45 volumes of *water R* and dilute to 10.0 ml with the same mixture of solvents.

Reference solution (b). Dilute 0.3 ml of the test solution to 100.0 ml with a mixture of 10 volumes of *ethanol R*, 45 volumes of *acetonitrile R* and 45 volumes of *water R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.125 m long and 4 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 35 volumes of *acetonitrile R* and 65 volumes of a solution prepared as follows: add 1 ml of *trifluoroacetic acid R* to 500 ml of *water R*, add 1 ml of *triethylamine R* and dilute to 1000 ml with *water R*,
- as detector a spectrophotometer set at 232 nm.

Inject 10 µl of reference solution (a). When the chromatograms are recorded in the conditions described the relative retention of impurity A is about 0.9. The test is not valid unless the resolution between the peaks corresponding to impurity A and piroxicam is not less than 2.

Inject 10 µl of the test solution and 10 µl of reference solution (b). Continue the chromatography of the test solution for 5 times the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than 3.33 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C for 4 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 25 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid* determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 36.24 mg of C₁₇H₁₈N₃O₅S.

STORAGE

Store protected from light.

IMPURITIES

A. 4-phenoxy-3-(1*H*-pyrrol-1-yl)-5-sulphamoylbenzoic acid,

B. methyl-3-[[[(dimethylamino)methylene]sulphamoyl]-4-phenoxy-5-(pyrrolidin-1-yl)benzoate,

C. 4-(pyrrolidin-1-yl)dibenzo[*b,d*]furan-2-carboxylic acid.

corrected

PIROXICAM

Piroxicamum

C₁₅H₁₃N₃O₄S

*M*_r 331.4

DEFINITION

Piroxicam contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 4-hydroxy-2-methyl-*N*-(pyridin-2-yl)-2*H*-1,2-benzothiazine-3-carboxamide 1,1-dioxide, calculated with reference to the dried substance.

CHARACTERS

A white or slightly yellow, crystalline powder, practically insoluble in water, soluble in methylene chloride, slightly soluble in ethanol.

It shows polymorphism.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *piroxicam CRS*. Examine the substances as discs prepared using *potassium bromide R*. If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the

reference substance separately in the minimum volume of *methylene chloride R*, evaporate to dryness on a water-bath and record new spectra using the residues.

TESTS

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 75 mg of the substance to be examined in *acetonitrile R* warming slightly if necessary and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *piroxicam for system suitability CRS* in *acetonitrile R* and dilute to 50.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 10.0 ml with *acetonitrile R*. Dilute 1.0 ml of the solution to 50.0 ml with *acetonitrile R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *base-deactivated octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min, a mixture of 40 volumes of *acetonitrile R* and 60 volumes of a 6.81 g/l solution of *potassium dihydrogen phosphate R* adjusted to pH 3.0 with *phosphoric acid R*,
- as detector a spectrophotometer set at 230 nm, maintaining the temperature of the column at 40 °C.

Inject 20 µl of each solution and continue the chromatography for 5 times the retention time of piroxicam. The test is not valid unless the chromatogram obtained with reference solution (a) has a similar profile to the chromatogram supplied with *piroxicam for system suitability CRS* and shows a peak due to impurity B with a relative retention of about 0.85 and a symmetry factor of at most 1.5.

In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the sum of the areas of such peaks is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent). Disregard any peak with an area less than 0.1 times that of the principal peak in the chromatogram obtained with reference solution (b).

Heavy metals (2.4.8). 1.0 g complies with limit test C (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 100–105 °C for 4 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 60 ml of a mixture of equal volumes of *acetic anhydride R* and *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 33.14 mg of C₁₅H₁₃N₃O₄S.

STORAGE

In an airtight container, protected from light.

IMPURITIES

A. pyridin-2-amine,

B. 4-hydroxy-N-(pyridin-2-yl)-2H-1,2-benzothiazine-3-carboxamide 1,1-dioxide,

C. 4-hydroxy-2-methyl-2H-1,2-benzothiazine-3-carboxamide 1,1-dioxide,

D. R = CH₃: methyl (1,1-dioxido-3-oxo-1,2-benzisothiazol-2(3H)-yl)acetate,

E. R = C₂H₅: ethyl (1,1-dioxido-3-oxo-1,2-benzisothiazol-2(3H)-yl)acetate,

F. R = CH(CH₃)₂: 1-methylethyl (1,1-dioxido-3-oxo-1,2-benzisothiazol-2(3H)-yl)acetate,

G. R₁ = CH₃, R₂ = H: methyl 4-hydroxy-2H-1,2-benzothiazine-3-carboxylate 1,1-dioxide,

H. R₁ = C₂H₅, R₂ = H: ethyl 4-hydroxy-2H-1,2-benzothiazine-3-carboxylate 1,1-dioxide,

I. R₁ = CH(CH₃)₂, R₂ = H: 1-methylethyl 4-hydroxy-2H-1,2-benzothiazine-3-carboxylate 1,1-dioxide,

J. R₁ = R₂ = CH₃: methyl 4-hydroxy-2-methyl-2H-1,2-benzothiazine-3-carboxylate 1,1-dioxide,

K. R₁ = C₂H₅, R₂ = CH₃: ethyl 4-hydroxy-2-methyl-2H-1,2-benzothiazine-3-carboxylate 1,1-dioxide,

L. R₁ = CH(CH₃)₂, R₂ = CH₃: 1-methylethyl 4-hydroxy-2-methyl-2H-1,2-benzothiazine-3-carboxylate 1,1-dioxide.

01/2005:0852 TESTS

PIVAMPICILLIN

Pivampicillinum

 $C_{22}H_{29}N_3O_6S$ M_r 463.6

DEFINITION

Pivampicillin contains not less than 95.0 per cent and not more than the equivalent of 101.0 per cent of methylene (2*S*, 5*R*, 6*R*)-6-[[*(2R)*-2-amino-2-phenylacetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate 2,2-dimethylpropanoate, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, freely soluble in methanol, soluble in ethanol. It dissolves in dilute acids.

IDENTIFICATION

First identification: A.

Second identification: B, C.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *pivampicillin CRS*.
- B. Examine by thin-layer chromatography (2.2.27), using *silanised silica gel H R* as the coating substance.

Test solution. Dissolve 10 mg of the substance to be examined in 2 ml of *methanol R*.

Reference solution (a). Dissolve 10 mg of *pivampicillin CRS* in 2 ml of *methanol R*.

Reference solution (b). Dissolve 10 mg of *bacampicillin hydrochloride CRS*, 10 mg of *pivampicillin CRS* and 10 mg of *talampicillin hydrochloride CRS* in 2 ml of *methanol R*.

Apply to the plate 1 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of a 272 g/l solution of *sodium acetate R*, adjusted to pH 5.0 with *glacial acetic acid R*, 40 volumes of *water R* and 50 volumes of *alcohol R*. Dry the plate in a current of warm air, spray with *ninhydrin solution R1* and heat the plate at 60 °C for 10 min. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 3 clearly separated spots.

- C. Place about 2 mg in a test-tube about 150 mm long and 15 mm in diameter. Moisten with 0.05 ml of *water R* and add 2 ml of *sulphuric acid-formaldehyde reagent R*. Mix the contents of the tube by swirling; the solution is almost colourless. Place the test-tube in a water-bath for 1 min; a dark yellow colour develops.

Appearance of solution. Dissolve 50 mg in 12 ml of 0.1 *M hydrochloric acid*. The solution is not more opalescent than reference suspension II (2.2.1) and not more intensely coloured than reference solution B₇ (2.2.2, *Method I*).

Specific optical rotation (2.2.7). Dissolve 0.100 g in 5.0 ml of *alcohol R* and dilute to 10.0 ml with 0.1 *M hydrochloric acid*. The specific optical rotation is + 208 to + 222, calculated with reference to the anhydrous substance.

Related substances. Examine by liquid chromatography (2.2.29). Prepare the solutions immediately before use.

Test solution. Dissolve 50.0 mg of the substance to be examined in 10.0 ml of *acetonitrile R* and dilute to 20 ml with a 1 g/l solution of *phosphoric acid R*.

Reference solution. Mix 2.0 ml of the test solution with 9.0 ml of *acetonitrile R* and 9.0 ml of a 1 g/l solution of *phosphoric acid R*.

The chromatographic procedure may be carried out using:

- a column 0.125 m long and 4 mm in internal diameter packed with *end-capped octylsilyl silica gel for chromatography R*,

- as mobile phase at a flow rate of 1.5 ml/min:

Mobile phase A. A mixture of 50 volumes of a 1.32 g/l solution of *ammonium phosphate R*, adjusted to pH 2.5 with a 100 g/l solution of *phosphoric acid R*, and 50 volumes of *acetonitrile R*,

Mobile phase B. A mixture of 15 volumes of a 1.32 g/l solution of *ammonium phosphate R*, adjusted to pH 2.5 with a 100 g/l solution of *phosphoric acid R*, and 85 volumes of *acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 10	100	0	isocratic
10 - 12	0	100	isocratic
12 - 17	100	0	re-equilibration

- as detector a spectrophotometer set at 220 nm.

Inject 50 µl of the test solution and 50 µl of the reference solution. The test is not valid unless the ratio of the mass distribution ratio of pivampicillin dimer (which has a retention time of about 5 min) to that of pivampicillin (principal peak) is at least 12. In the chromatogram obtained with the test solution, the sum of the areas of all the peaks, apart from the principal peak, is not greater than 0.3 times the area of the principal peak in the chromatogram obtained with the reference solution (3 per cent). Disregard any peak due to the solvent and any peak with an area less than 0.01 times the area of the principal peak in the chromatogram obtained with the reference solution.

***N,N*-Dimethylaniline** (2.4.26, *Method B*). Not more than 20 ppm.

Test solution. To 1.00 g of the substance to be examined in a ground-glass-stoppered tube add 10 ml of 0.5 *M sulphuric acid*. Heat the tube for 10 min in a water-bath, cool and add 15 ml of 1 *M sodium hydroxide* and 1.0 ml of the internal standard solution. Stopper the tube and shake vigorously for 1 min. Centrifuge if necessary and use the upper layer.

Triethanolamine. Examine by thin-layer chromatography (2.2.27), using *silica gel H R* as the coating substance.

Test solution. Dissolve 0.100 g of the substance to be examined in 1.0 ml of a mixture of 1 volume of *water R* and 9 volumes of *acetonitrile R*.

Reference solution. Dissolve 5.0 mg of triethanolamine *R* in a mixture of 1 volume of water *R* and 9 volumes of acetonitrile *R* and dilute to 100 ml with the same mixture of solvents.

Apply to the plate 10 µl of each solution. Develop over a path of 12 cm using a mixture of 5 volumes of methanol *R*, 15 volumes of butanol *R*, 24 volumes of phosphate buffer solution pH 5.8 *R*, 40 volumes of glacial acetic acid *R* and 80 volumes of butyl acetate *R*. Dry the plate at 110 °C for 10 min and allow to cool. Place in a chromatographic tank an evaporating dish containing a mixture of 1 volume of hydrochloric acid *R1*, 1 volume of water *R* and 2 volumes of a 15 g/l solution of potassium permanganate *R*. Close the tank and allow to stand for 15 min. Place the dried plate in the tank and close the tank. Leave the plate in contact with the chlorine vapour in the tank for 15-20 min. Remove the plate, allow it to stand in air for 2-3 min and spray with tetramethyldiaminodiphenylmethane reagent *R*. Any spot corresponding to triethanolamine in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (0.05 per cent).

Water (2.5.12). Not more than 1.0 per cent, determined on 0.30 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.5 per cent, determined on 1.0 g.

ASSAY

Examine by liquid chromatography (2.2.29). Use the solutions within 2 h of preparation.

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 50.0 mg of pivampicillin CRS in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (b). Dissolve 25.0 mg of propyl parahydroxybenzoate CRS in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 50.0 ml with the mobile phase. Mix 5.0 ml of this solution with 5.0 ml of reference solution (a).

The chromatographic procedure may be carried out using:

- a stainless steel column 0.125 m long and 4 mm in internal diameter packed with octadecylsilyl silica gel for chromatography *R* (5 µm),
- as mobile phase at a flow rate of 1.5 ml/min a mixture of 40 volumes of acetonitrile *R* and 60 volumes of a 2.22 g/l solution of phosphoric acid *R* adjusted to pH 2.5 with triethylamine *R*,
- as detector a spectrophotometer set at 220 nm.

Inject 20 µl of reference solution (b). Adjust the sensitivity of the system so that the height of each of the 2 principal peaks in the chromatogram obtained is at least 50 per cent of the full scale of the recorder. The test is not valid unless the resolution between the first peak (pivampicillin) and the second peak (propyl parahydroxybenzoate) is at least 5.0 and the symmetry factor for the pivampicillin peak is at most 2.0. Inject 20 µl of reference solution (a) 6 times. The test is not valid unless the relative standard deviation for the area of the principal peak is at most 1.0 per cent. Inject alternately the test solution and reference solution (a).

STORAGE

Store in an airtight container.

IMPURITIES

- A. 2-[[[(2*R*)-2-amino-2-phenylacetyl]amino]-2-[(4*S*)-4-[[[(2,2-dimethylpropanoyl)oxy]methoxy]carbonyl]-5,5-dimethylthiazolidin-2-yl]acetic acid (penicilloic acids of pivampicillin),

- B. methylene (4*S*)-5,5-dimethyl-2-(3,6-dioxo-5-phenylpiperazin-2-yl)thiazolidine-4-carboxylate 2,2-dimethylpropanoate (diketopiperazines of pivampicillin),

- C. co-oligomers of pivampicillin and of penicilloic acids of pivampicillin.

01/2005:1359

PIVMECILLINAM HYDROCHLORIDE

Pivmecillinami hydrochloridum

C₂₁H₃₄ClN₃O₅S

M_r 476.0

DEFINITION

Pivmecillinam hydrochloride contains not less than 97.0 per cent and not more than the equivalent of 101.5 per cent of methylene 2,2-dimethylpropanoate (2*S*,5*R*,6*R*)-6-[[[hexahydro-1*H*-azepin-1-yl]methylene]amino]-3,3-dimethyl-

7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate hydrochloride, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, freely soluble in water, in ethanol and in methanol, slightly soluble in acetone.

IDENTIFICATION

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *pivmecillinam hydrochloride CRS*. Examine the substances prepared as discs.
- B. It gives reaction (a) of chlorides (2.3.1).

TESTS

Appearance of solution. Dissolve 0.5 g in *water R* and dilute to 10 ml with the same solvent. The solution is not more opalescent than reference suspension II (2.2.1) and not more intensely coloured than reference solution B₈ (2.2.2, *Method I*).

pH (2.2.3). Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent. The pH of the solution is 2.8 to 3.8.

Related substances. Examine by liquid chromatography (2.2.29) as prescribed under Assay. Inject 20 µl of reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained is at least 50 per cent of the full-scale of the recorder. Inject 20 µl of test solution (b) and continue the chromatography for 3 times the retention time of the principal peak. In the chromatogram obtained with test solution (b): the area of any peak, apart from the principal peak, is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3 per cent). Disregard any peak with an area less than 0.1 times that of the principal peak in the chromatogram obtained with reference solution (b).

***N,N*-Dimethylaniline** (2.4.26, *Method A*): maximum 20 ppm.

Test solution. Prepare as described in the general method but heat at about 27 °C after the addition of *strong sodium hydroxide solution R*, to dissolve the precipitate formed, then add the *trimethylpentane R*.

Heavy metals (2.4.8). Dissolve 1.0 g in *water R* and dilute to 20 ml with the same solvent. 12 ml of the solution complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Water (2.5.12). Not more than 0.5 per cent, determined on 1.00 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Examine by liquid chromatography (2.2.29). *Prepare the test and reference solutions immediately before use.*

Solvent mixture. To 45 volumes of *acetonitrile R* add 55 volumes of a 13.5 g/l solution of *potassium dihydrogen phosphate R* previously adjusted to pH 3.0 with *dilute phosphoric acid R*.

Test solution (a). Dissolve 20.0 mg of the substance to be examined in the solvent mixture and dilute to 200.0 ml with the solvent mixture.

Test solution (b). Dissolve 25.0 mg of the substance to be examined in the solvent mixture and dilute to 25.0 ml with the solvent mixture.

Reference solution (a). Dissolve 20.0 mg of *pivmecillinam hydrochloride CRS* in the solvent mixture and dilute to 200.0 ml with the solvent mixture.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 50.0 ml with the solvent mixture.

Reference solution (c). Dissolve 5 mg of *pivmecillinam hydrochloride CRS* and 5 mg of *pivmecillinam impurity C CRS* in the solvent mixture and dilute to 50 ml with the solvent mixture.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.0 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.0 ml/min a mixture prepared as follows: dissolve 0.55 g of *tetraethylammonium hydrogen sulphate R* and 1.0 g of *tetramethylammonium hydrogen sulphate R* in the solvent mixture and dilute to 1000 ml with the solvent mixture,
- as detector a spectrophotometer set at 220 nm.

Inject 20 µl of reference solution (c). Adjust the sensitivity of the system so that the heights of the 2 principal peaks in the chromatogram obtained are at least 50 per cent of the full scale of the recorder. The test is not valid unless, in the chromatogram obtained, the resolution between the first peak (*pivmecillinam*) and the second peak (*impurity C*) is at least 3.5. Inject reference solution (a) 6 times. The test is not valid unless the relative standard deviation of the peak area for *pivmecillinam* is at most 1.0 per cent. Inject alternately test solution (a) and reference solution (a).

STORAGE

Store protected from light, at a temperature of 2 °C to 8 °C.

IMPURITIES

- A. methylene (2*S*,5*R*,6*R*)-6-amino-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate 2,2-dimethylpropanoate (pivaloyloxymethyl 6-aminopenicillanate),

- B. R = CO₂H: 2-[(hexahydro-1*H*-azepin-1-yl)methylene]amino-2-[(4*S*)-4-[[[(2,2-dimethylpropanoyl)oxy]methoxy]carbonyl]-5,5-dimethylthiazolidin-2-yl]acetic acid (penicilloic acids of pivmecillinam),
- C. R = H: methylene 2,2-dimethylpropanoate (2*RS*,4*S*)-2-[[[(hexahydro-1*H*-azepin-1-yl)methylene]amino]methyl]-5,5-dimethylthiazolidin-4-carboxylate,

D. methylene 2,2-dimethylpropanoate (4S)-2-[1-(formylamino)-2-(hexahydro-1H-azepin-1-yl)-2-oxoethyl]-5,5-dimethylthiazolidin-4-carboxylate.

01/2005:1464

POLOXAMERS

Poloxamera

DEFINITION

Synthetic block copolymer of ethylene oxide and propylene oxide, represented by the following general formula:

Poloxamer type	Ethylene oxide units (a)	Propylene oxide units (b)	Content of oxyethylene (per cent)	Average molecular mass
124	10 - 15	18 - 23	44.8 - 48.6	2090 - 2360
188	75 - 85	25 - 30	79.9 - 83.7	7680 - 9510
237	60 - 68	35 - 40	70.5 - 74.3	6840 - 8830
338	137 - 146	42 - 47	81.4 - 84.9	12 700 - 17 400
407	95 - 105	54 - 60	71.5 - 74.9	9840 - 14 600

A suitable antioxidant may be added.

CHARACTERS

Appearance: colourless or almost colourless liquid (poloxamer 124); white or almost white, waxy powder, microbeads or flakes.

Solubility: very soluble in water and in alcohol, practically insoluble in light petroleum (50-70 °C).

mp: about 50 °C for poloxamers 188, 237, 338 and 407.

IDENTIFICATION

First identification: A, B.

Second identification: B, C.

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: chemical reference substance of the Ph. Eur. corresponding to the type of poloxamer to be examined.

B. It complies with the test for average molecular mass (see Tests).

C. It complies with the test for oxypropylene:oxyethylene ratio (see Tests).

TESTS

Solution S. Dissolve 10.0 g in carbon dioxide-free water R and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is not more intensely coloured than reference solution BY₇ (2.2.2, Method II).

pH (2.2.3): 5.0 to 7.5 for solution S.

Ethylene oxide, propylene oxide and dioxan. Head-space gas chromatography (2.2.28).

Ethylene oxide stock solution. Introduce 0.5 g of ethylene oxide solution R5 in a vial and dilute to 50.0 ml with dimethyl sulphoxide R1. Mix carefully.

Ethylene oxide solution. Dilute 1.0 ml of ethylene oxide stock solution to 250 ml with dimethyl sulphoxide R1.

Propylene oxide stock solution. Introduce about 7 ml of methylene chloride R in a volumetric flask and add 0.500 g (m) of propylene oxide R. Dilute to 10.0 ml with methylene chloride R. Dilute 0.5 ml of this solution to 50.0 ml with dimethyl sulphoxide R1. Mix carefully. Calculate the exact concentration of propylene oxide in mg/ml using the following expression:

$$\frac{m \times 1000 \times 0.5}{10 \times 50}$$

Propylene oxide solution. Dilute 1.0 ml of propylene oxide stock solution to 50.0 ml with dimethyl sulphoxide R1.

Calculate the exact concentration of propylene oxide in µg/ml using the following expression:

$$\frac{C \times 1000 \times 1}{50}$$

C = concentration of the propylene oxide stock solution in mg/ml.

Dioxan solution. Introduce 0.100 g (m) of dioxan R in a flask and dilute to 50.0 ml with dimethyl sulphoxide R1. Dilute 2.50 ml of this solution to 100.0 ml with dimethyl sulphoxide R1.

Calculate the exact concentration of dioxan in µg/ml using the following expression:

$$\frac{m \times 2.50 \times 1000 \times 1000}{50 \times 100}$$

Mixture solution. Dilute a mixture of 6.0 ml of ethylene oxide solution, 6.0 ml of propylene oxide solution and 2.5 ml of dioxan solution to 25.0 ml with dimethyl sulphoxide R1.

Test solution. To 1.000 g of the substance to be examined in a head-space vial, add 4.0 ml of dimethyl sulphoxide R1 and close the vial immediately.

Reference solution. To 1.000 g of the substance to be examined in a head-space vial, add 2.0 ml of dimethyl sulphoxide R1 and 2.0 ml of the mixture solution. Close the vial immediately.

Column:

- **material:** fused silica,
- **size:** l = 50 m, Ø = 0.32 mm,
- **stationary phase:** poly(dimethyl)(diphenyl)siloxane R (film thickness 5 µm).

Carrier gas: helium for chromatography R.

Flow rate: 1.4 ml/min.

Static head-space conditions:

- **equilibrium temperature:** 110 °C,
- **equilibration time:** 30 min,
- **transfer-line temperature:** 140 °C,
- **pressurisation time:** 1 min,
- **injection time:** 0.05 min.

Temperature:

	Time (min)	Temperature (°C)
	0 - 10	70
Column	10 - 27	70 → 240
Injection port		250
Detector		250

Detection: flame ionisation.

Injection: inject a suitable volume of the gaseous phase, for example 1 ml.

Relative retention with reference to ethylene oxide (retention time = about 6 min): propylene oxide = about 1.3; methylene chloride = about 1.6; dioxan = about 3.0; dimethyl sulphoxide = about 3.7.

Limits:

- **ethylene oxide:** not more than half the area of the corresponding peak in the chromatogram obtained with the reference solution (1 ppm),
- **propylene oxide:** not more than half the area of the corresponding peak in the chromatogram obtained with the reference solution (5 ppm),
- **dioxan:** not more than half the area of the corresponding peak in the chromatogram obtained with the reference solution (10 ppm).

Average molecular mass. Weigh 15 g (*m*) of the substance to be examined into a 250 ml ground-glass-stoppered flask, add 25.0 ml of *phthalic anhydride solution R* and a few glass beads and swirl to dissolve. Boil gently under a reflux condenser for 1 h, allow to cool and add 2 quantities, each of 10 ml, of *pyridine R*, through the condenser. Add 10 ml of *water R*, mix and allow to stand for 10 min. Add 40.0 ml of 0.5 M sodium hydroxide and 0.5 ml of a 10 g/l solution of *phenolphthalein R* in *pyridine R*. Titrate with 0.5 M sodium hydroxide to a light pink endpoint that persists for 15 s and record the volume of sodium hydroxide used (*S*). Prepare a blank in the same manner but omitting the substance to be examined. Record the volume of sodium hydroxide used (*B*). Calculate the average molecular mass using the expression:

$$\frac{4000m}{B - S}$$

Oxypropylene:oxyethylene ratio. Nuclear magnetic resonance spectrometry (2.2.33).

Use a 100 g/l solution of the substance to be examined in *deuterated chloroform R*. Record the average area of the doublet appearing at about 1.08 ppm due to the methyl groups of the oxypropylene units (*A*₁) and the average area of the composite band from 3.2 ppm to 3.8 ppm due to CH₂O groups of both the oxyethylene and oxypropylene units and the CHO groups of the oxypropylene units (*A*₂) with reference to the internal standard.

Calculate the percentage of oxyethylene, by weight, in the sample being examined using the following expression:

$$\frac{3300\alpha}{33\alpha + 58}$$

where $\alpha = \frac{A_2}{A_1} - 1$

Water (2.5.12): maximum 1.0 per cent, determined on 1.000 g.

Total ash (2.4.16): maximum 0.4 per cent, determined on 1.0 g.

STORAGE

In an airtight container.

LABELLING

The label states:

- the type of poloxamer,
- the name and concentration of any added antioxidant.

01/2005:0733

POLYACRYLATE DISPERSION 30 PER CENT

Polyacrylatis dispersio 30 per centum

DEFINITION

Polyacrylate dispersion 30 per cent is a dispersion in water of a copolymer of ethyl acrylate and methyl methacrylate having a mean relative molecular mass of about 800 000. It may contain a suitable emulsifier. The residue on evaporation is not less than 28.5 per cent *m/m* and not more than 31.5 per cent *m/m*.

CHARACTERS

An opaque, white, slightly viscous liquid, miscible with water, soluble in acetone, in ethanol and in 2-propanol.

IDENTIFICATION

First identification: A.

Second identification: B, C, D, E.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of polyacrylate*.
- To 1 g add 5 ml of *water R* and mix; the mixture remains opaque. Take three 1 g portions and mix separately with 5 g each of *ethanol R*, *acetone R* and *2-propanol R*. Transparent solutions are obtained.
- To 1 g add 10 ml of 0.1 M sodium hydroxide. The mixture remains opaque.
- It complies with the test for appearance of a film (see Tests).
- Dry 4 g in a Petri dish at 60 °C in an oven for 4 h and transfer the resulting clear film to a small test-tube (100 mm × 12 mm). Heat over a flame and collect the fumes that evolve in a second test-tube held over the mouth of the first tube. The condensate gives the reaction of esters (2.3.1).

TESTS

Relative density (2.2.5): 1.037 to 1.047.

Apparent viscosity. Determine the viscosity (2.2.10) using a rotating viscometer at 20 °C. At a shear rate of 10 s⁻¹, the apparent viscosity is not more than 50 mPa.s.

Appearance of a film. Pour 1 ml on a glass plate and allow to dry. A clear elastic film is formed.

Particulate matter. Filter 100.0 g through a tared stainless steel sieve (90). Rinse with *water R* until a clear filtrate is obtained and dry at 80 °C to constant mass. The mass of the residue is not more than 0.500 g.

Residual monomers. Not more than 100 ppm, determined by liquid chromatography (2.2.29).

Test solution. Dissolve 1.00 g of the substance to be examined in *tetrahydrofuran R* and dilute to 50.0 ml with the same solvent. To 5.0 ml of a 35 g/l solution of *sodium perchlorate R* add 10.0 ml of the solution dropwise

01/2005:0203
corrected

whilst stirring continuously. Centrifuge and filter the clear supernatant liquid. Dilute 5.0 ml to 10.0 ml with *water R*.

Reference solution. Dissolve 10 mg each of *ethyl acrylate R* and *methyl methacrylate R* in *tetrahydrofuran R* and dilute to 50.0 ml with the same solvent. Dilute 1.0 ml of this solution to 100.0 ml with *tetrahydrofuran R*. To 10.0 ml of the final solution add 5.0 ml of a 35 g/l solution of *sodium perchlorate R* and mix. Dilute 5.0 ml of the mixture to 10.0 ml with *water R*.

The chromatographic procedure may be carried out using:

- a column 0.12 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm to 10 µm),
- as mobile phase at a flow rate of 2 ml/min a mixture of 15 volumes of *acetonitrile R* and 85 volumes of *water R*,
- as detector a spectrophotometer set at 205 nm.

Inject separately equal volumes (about 50 µl) of each solution.

Calculate the percentage content of monomers from the area of the peaks in the chromatograms obtained with the test solution and the reference solution and from the content of monomers in the reference solution.

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Sulphated ash (2.4.14). Not more than 0.4 per cent, determined on 1.0 g.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10³ micro-organisms per gram, determined by plate count.

ASSAY

Dry 1.000 g at 110 °C for 3 h and weigh the mass of the residue.

STORAGE

Store at a temperature of 5 °C to 25 °C. Protect from freezing. Handle the substance so as to minimise microbial contamination.

LABELLING

The label states, where applicable, the name and concentration of any added emulsifier.

POLYMYXIN B SULPHATE

Polymyxini B sulfas

polymyxin	R	R'	X	Molecular formula	<i>M_r</i>
B1	CH ₃	CH ₃	L-Leu	C ₅₆ H ₉₈ N ₁₆ O ₁₃	1204
B2	H	CH ₃	L-Leu	C ₅₅ H ₉₆ N ₁₆ O ₁₃	1190
B3	CH ₃	H	L-Leu	C ₅₅ H ₉₆ N ₁₆ O ₁₃	1190
B1-I	CH ₃	CH ₃	L-Ile	C ₅₆ H ₉₈ N ₁₆ O ₁₃	1204

DEFINITION

Mixture of the sulphates of polypeptides produced by the growth of certain strains of *Paenibacillus polymyxa*, or obtained by any other means, the main component being polymyxin B1.

Content:

- sum of polymyxins B1, B2, B3 and B1-I: minimum 80.0 per cent (dried substance),
- polymyxin B3: maximum 6.0 per cent (dried substance),
- polymyxin B1-I: maximum 15.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder, hygroscopic.

Solubility: soluble in water, slightly soluble in alcohol.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 5 mg of the substance to be examined in 1 ml of a mixture of equal volumes of *hydrochloric acid R* and *water R*. Heat at 135 °C in a sealed tube for 5 h. Evaporate to dryness on a water-bath and continue the heating until the hydrochloric acid has evaporated. Dissolve the residue in 0.5 ml of *water R*.

Reference solution (a). Dissolve 20 mg of *leucine R* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 20 mg of *threonine R* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (c). Dissolve 20 mg of *phenylalanine R* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (d). Dissolve 20 mg of *serine R* in *water R* and dilute to 10 ml with the same solvent.

Plate: TLC silica gel G plate R.

Mobile phase: *water R*, *phenol R* (25:75 V/V).

Carry out the following procedures protected from light.

Application: 5 µl, as bands of 10 mm.

Place the plate in the chromatographic tank, so that it is not in contact with the mobile phase, and allow to become impregnated with the vapour of the solvent for at least 12 h.

Development: over a path of 12 cm using the same mobile phase.

Drying: at 100-105 °C.

Detection: spray with *ninhydrin solution R1* and heat at 110 °C for 5 min.

Results: the chromatogram obtained with the test solution shows bands corresponding to those in the chromatograms obtained with reference solutions (a), (b) and (c), but shows no band corresponding to that in the chromatogram obtained with reference solution (d). The chromatogram obtained with the test solution also shows a band with a very low R_f value (2,4-diaminobutyric acid).

B. Examine the chromatograms obtained in the assay.

Results: the peaks due to polymyxins B1, B2, B3 and B1-I in the chromatogram obtained with the test solution are similar in retention time to the corresponding peaks in the chromatogram obtained with reference solution (a).

C. Dissolve about 2 mg in 5 ml of *water R* and add 5 ml of a 100 g/l solution of *sodium hydroxide R*. Shake and add dropwise 0.25 ml of a 10 g/l solution of *copper sulphate R*, shaking after each addition. A reddish-violet colour develops.

D. It gives reaction (a) of sulphates (2.3.1).

TESTS

pH (2.2.3): 5.0 to 7.0.

Dissolve 0.2 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent.

Specific optical rotation (2.2.7): –78 to –90 (dried substance).

Dissolve 0.50 g in *water R* and dilute to 25.0 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29): use the normalisation procedure.

Test solution. Dissolve 50.0 mg of the substance to be examined in a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R* and dilute to 100.0 ml with the same mixture of solvents.

Reference solution (a). Dissolve 50.0 mg of *polymyxin B sulphate CRS* in a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R* and dilute to 100.0 ml with the same mixture of solvents.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with a mixture of 20 volumes of *acetonitrile R* and 80 volumes of *water R*.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** base-deactivated end-capped octadecylsilyl silica gel for chromatography *R* (5 μ m),
- **temperature:** 30 °C.

Mobile phase: mix 20 volumes of *acetonitrile R* and 80 volumes of a solution prepared as follows: dissolve 4.46 g of *anhydrous sodium sulphate R* in 900 ml of *water R*, adjust to pH 2.3 using *dilute phosphoric acid R* and dilute to 1000 ml with *water R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 215 nm.

Injection: 20 μ l.

Run time: 1.4 times the retention time of polymyxin B1.

Relative retention with reference to polymyxin B1 (retention time = about 35 min): polymyxin B2 = about 0.5; polymyxin B3 = about 0.6; polymyxin B1-I = about 0.8.

System suitability: reference solution (a):

- **resolution:** minimum of 3.0 between the peaks due to polymyxin B2 and polymyxin B3.

Limits:

- **any impurity:** maximum 3.0 per cent,
- **total:** maximum 17.0 per cent,
- **disregard limit:** 0.7 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Sulphate: 15.5 per cent to 17.5 per cent (dried substance).

Dissolve 0.250 g in 100 ml of *water R* and adjust the solution to pH 11 using *concentrated ammonia R*. Add 10.0 ml of 0.1 M *barium chloride* and about 0.5 mg of *phthalein purple R*. Titrate with 0.1 M *sodium edetate*, adding 50 ml of *alcohol R* when the colour of the solution begins to change and continuing the titration until the violet-blue colour disappears.

1 ml of 0.1 M *barium chloride* is equivalent to 9.606 mg of SO_4 .

Loss on drying (2.2.32): maximum 6.0 per cent, determined on 1.000 g by drying at 60 °C over *diphosphorus pentoxide R* at a pressure not exceeding 670 Pa for 3 h.

Sulphated ash (2.4.14): maximum 0.75 per cent, determined on 1.0 g.

Pyrogens (2.6.8). If intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of pyrogens, it complies with the test for pyrogens. Inject, per kilogram of the rabbit's mass, 1 ml of a solution in *water for injections R* containing 1.5 mg of the substance to be examined per millilitre.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modification.

Injection: test solution and reference solution (a).

Calculate the percentage content of polymyxin B3 and B1-I, and the sum of polymyxins B1, B2, B3 and B1-I using the corresponding declared contents of *polymyxin sulphate CRS*.

STORAGE

In an airtight container, protected from light. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is apyrogenic.

01/2005:0426
corrected

POLYSORBATE 20

Polysorbatum 20

DEFINITION

Mixture of partial esters of fatty acids, mainly lauric acid, with sorbitol and its anhydrides ethoxylated with approximately 20 moles of ethylene oxide for each mole of sorbitol and sorbitol anhydrides.

CHARACTERS

Appearance: oily, yellow to brownish-yellow, clear or slightly opalescent liquid.

Solubility: soluble in water, in ethanol, in ethyl acetate and in methanol, practically insoluble in fatty oils and in liquid paraffin.

Relative density: about 1.10.

Viscosity: about 400 mPas at 25 °C.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D, E.

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of polysorbate 20.

B. It complies with the test for hydroxyl value (see Tests).

C. It complies with the test for saponification value (see Tests).

D. It complies with the test for composition of fatty acids (see Tests).

E. Dissolve 0.1 g in 5 ml of *methylene chloride R*. Add 0.1 g of *potassium thiocyanate R* and 0.1 g of *cobalt nitrate R*. Stir with a glass rod. The solution becomes blue.

TESTS

Acid value (2.5.1): maximum 2.0.

Dissolve 5.0 g in 50 ml of the prescribed mixture of solvent.

Hydroxyl value (2.5.3, Method A): 96 to 108.

Peroxide value: maximum 10.0.

Introduce 10.0 g into a 100 ml beaker, dissolve with *glacial acetic acid R* and dilute to 20 ml with the same solvent. Add 1 ml of *saturated potassium iodide solution R* and allow to stand for 1 min. Add 50 ml of *carbon dioxide-free water R* and a magnetic stirring bar. Titrate with 0.01 M *sodium thiosulphate*, determining the end-point potentiometrically (2.2.20). Carry out a blank titration.

Determine the peroxide value using the following expression:

$$\frac{(n_1 - n_2) \times M \times 1000}{m}$$

n_1 = volume of 0.01 M *sodium thiosulphate* required for the substance to be examined, in millilitres,

n_2 = volume of 0.01 M *sodium thiosulphate* required for the blank, in millilitres,

M = molarity of the sodium thiosulphate solution, in moles per litre,

m = mass of substance to be examined, in grams.

Saponification value (2.5.6): 40 to 50, determined on 4.0 g.

Use 15.0 ml of 0.5 M *alcoholic potassium hydroxide* and dilute with 50 ml of *alcohol R* before carrying out the titration. Heat under reflux for 60 min.

Composition of fatty acids (2.4.22, Method C). Prepare reference solution (a) as indicated in Table 2.4.22-2.

Column:

- *material:* fused silica,
- *dimensions:* $l = 30$ m, $\varnothing = 0.32$ mm,
- *stationary phase:* *macrogol 20 000 R* (film thickness 0.5 µm).

Carrier gas: *helium for chromatography R*.

Linear velocity: 50 cm/s.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 14	80 → 220
	14 - 54	220
Injection port		250
Detector		250

Detection: flame ionisation.

Injection: 1 µl.

Composition of the fatty acid fraction of the substance:

- *caproic acid:* maximum 1.0 per cent,
- *caprylic acid:* maximum 10.0 per cent,
- *capric acid:* maximum 10.0 per cent,
- *lauric acid:* 40.0 per cent to 60.0 per cent,
- *myristic acid:* 14.0 per cent to 25.0 per cent,
- *palmitic acid:* 7.0 per cent to 15.0 per cent,
- *stearic acid:* maximum 7.0 per cent,
- *oleic acid:* maximum 11.0 per cent,
- *linoleic acid:* maximum 3.0 per cent.

Ethylene oxide and dioxan (2.4.25, Method A): maximum 1 ppm of ethylene oxide and 10 ppm of dioxan.

Heavy metals (2.4.8): maximum 10 ppm.

2.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (2.5.12): maximum 3.0 per cent, determined on 1.00 g.

Total ash (2.4.16): maximum 0.25 per cent, determined on 2.0 g.

STORAGE

In an airtight container, protected from light.

01/2005:1914

POLYSORBATE 40

Polysorbatum 40

DEFINITION

Mixture of partial esters of fatty acids, mainly *Palmitic acid (1904)*, with sorbitol and its anhydrides ethoxylated with approximately 20 moles of ethylene oxide for each mole of sorbitol and sorbitol anhydrides.

CHARACTERS

Appearance: oily, viscous, yellowish or brownish-yellow liquid.

Solubility: miscible with water, with ethanol, with ethyl acetate and with methanol, practically insoluble in fatty oils and in liquid paraffin.

Relative density: about 1.10.

Viscosity: about 400 mPas at 30 °C.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D, E.

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of polysorbate 40.

B. It complies with the test for hydroxyl value (see Tests).

C. It complies with the test for saponification value (see Tests).

- D. It complies with the test for composition of fatty acids (see Tests).
- E. Dissolve 0.1 g in 5 ml of *methylene chloride R*. Add 0.1 g of *potassium thiocyanate R* and 0.1 g of *cobalt nitrate R*. Stir with a glass rod. The solution becomes blue.

TESTS

Acid value (2.5.1): maximum 2.0.

Dissolve 5.0 g in 50 ml of the prescribed mixture of solvents.

Hydroxyl value (2.5.3, *Method A*): 89 to 105.

Peroxide value: maximum 10.0.

Introduce 10.0 g into a 100 ml beaker, dissolve with *glacial acetic acid R* and dilute to 20 ml with the same solvent. Add 1 ml of *saturated potassium iodide solution R* and allow to stand for 1 min. Add 50 ml of *carbon dioxide-free water R* and a magnetic stirring bar. Titrate with *0.01 M sodium thiosulphate*, determining the end-point potentiometrically (2.2.20). Carry out a blank titration.

Determine the peroxide value using the following expression:

$$\frac{(n_1 - n_2) \times M \times 1000}{m}$$

- n_1 = volume of *0.01 M sodium thiosulphate* required for the substance to be examined, in millilitres,
- n_2 = volume of *0.01 M sodium thiosulphate* required for the blank, in millilitres,
- M = molarity of the sodium thiosulphate solution, in moles per litre,
- m = mass of substance to be examined, in grams.

Saponification value (2.5.6): 41 to 52, determined on 4.0 g.

Use 15.0 ml of *0.5 M alcoholic potassium hydroxide* and dilute with 50 ml of *alcohol R* before carrying out the titration. Heat under reflux for 60 min.

Composition of fatty acids (2.4.22, *Method C*). Prepare reference solution (a) as indicated in Table 2.4.22-1.

Column:

- **material**: fused silica,
- **size**: $l = 30$ m, $\varnothing = 0.32$ mm,
- **stationary phase**: *macrogol 20 000 R* (film thickness 0.5 μ m).

Carrier gas: *helium for chromatography R*.

Injection: 1 μ l.

Composition of the fatty acid fraction of the substance:

- **palmitic acid**: minimum 92.0 per cent.

Ethylene oxide and dioxan (2.4.25, *Method A*): maximum 1 ppm of ethylene oxide and maximum 10 ppm of dioxan.

Heavy metals (2.4.8): maximum 10 ppm.

2.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (2.5.12): maximum 3.0 per cent, determined on 1.00 g.

Total ash (2.4.16): maximum 0.25 per cent, determined on 2.0 g.

STORAGE

In an airtight container, protected from light.

01/2005:0427

POLYSORBATE 60

Polysorbatum 60

DEFINITION

Mixture of partial esters of fatty acids, mainly *Stearic acid 50 (1474)*, with sorbitol and its anhydrides ethoxylated with approximately 20 moles of ethylene oxide for each mole of sorbitol and sorbitol anhydrides.

CHARACTERS

Appearance: yellowish-brown gelatinous mass which becomes a clear liquid at temperatures above 25 °C.

Solubility: soluble in water, in ethanol, in ethyl acetate and in methanol, practically insoluble in fatty oils and in liquid paraffin.

Relative density: about 1.10.

Viscosity: about 400 mPa·s at 30 °C.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D, E.

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: *Ph. Eur. reference spectrum of polysorbate 60*.

B. It complies with the test for hydroxyl value (see Tests).

C. It complies with the test for saponification value (see Tests).

D. It complies with the test for composition of fatty acids (see Tests).

E. Dissolve 0.1 g in 5 ml of *methylene chloride R*. Add 0.1 g of *potassium thiocyanate R* and 0.1 g of *cobalt nitrate R*. Stir with a glass rod. The solution becomes blue.

TESTS

Acid value (2.5.1): maximum 2.0.

Dissolve 5.0 g in 50 ml of the prescribed mixture of solvents.

Hydroxyl value (2.5.3, *Method A*): 81 to 96.

Peroxide value: maximum 10.0.

Introduce 10.0 g into a 100 ml beaker, dissolve with *glacial acetic acid R* and dilute to 20 ml with the same solvent. Add 1 ml of *saturated potassium iodide solution R* and allow to stand for 1 min. Add 50 ml of *carbon dioxide-free water R* and a magnetic stirring bar. Titrate with *0.01 M sodium thiosulphate*, determining the end-point potentiometrically (2.2.20). Carry out a blank titration.

Determine the peroxide value using the following expression:

$$\frac{(n_1 - n_2) \times M \times 1000}{m}$$

- n_1 = volume of *0.01 M sodium thiosulphate* required for the substance to be examined, in millilitres,
- n_2 = volume of *0.01 M sodium thiosulphate* required for the blank, in millilitres,

M = molarity of the sodium thiosulphate solution, in moles per litre,

m = mass of substance to be examined, in grams.

Saponification value (2.5.6): 45 to 55, determined on 4.0 g. Use 15.0 ml of 0.5 *M* alcoholic potassium hydroxide and dilute with 50 ml of alcohol *R* before carrying out the titration. Heat under reflux for 60 min.

Composition of fatty acids (2.4.22, Method C). Prepare reference solution (a) as indicated in Table 2.4.22-1.

Column:

- **material:** fused silica,
- **size:** $l = 30$ m, $\varnothing = 0.32$ mm,
- **stationary phase:** macrogol 20 000 *R* (film thickness 0.5 μ m).

Carrier gas: helium for chromatography *R*.

Linear velocity: 50 cm/s.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 14	80 → 220
	14 - 54	220
Injection port		250
Detector		250

Detection: flame ionisation.

Injection: 1 μ l.

Composition of the fatty acid fraction of the substance:

- **stearic acid:** 40.0 per cent to 60.0 per cent,
- **sum of the contents of palmitic and stearic acids:** minimum 90.0 per cent.

Ethylene oxide and dioxan (2.4.25, Method A): maximum 1 ppm of ethylene oxide and maximum 10 ppm of dioxan.

Heavy metals (2.4.8): maximum 10 ppm.

2.0 g complies with limit test C. Prepare the standard using 2 ml of lead standard solution (10 ppm Pb) *R*.

Water (2.5.12): maximum 3.0 per cent, determined on 1.00 g.

Total ash (2.4.16): maximum 0.25 per cent, determined on 2.0 g.

STORAGE

In an airtight container, protected from light.

01/2005:0428

POLYSORBATE 80

Polysorbatum 80

DEFINITION

Mixture of partial esters of fatty acids, mainly *Oleic acid* (0799), with sorbitol and its anhydrides ethoxylated with approximately 20 moles of ethylene oxide for each mole of sorbitol and sorbitol anhydrides.

CHARACTERS

Appearance: oily, yellowish or brownish-yellow, clear liquid.

Solubility: miscible with water, with ethanol, with ethyl acetate and with methanol, practically insoluble in fatty oils and in liquid paraffin.

Relative density: about 1.10.

Viscosity: about 400 mPa·s at 25 °C.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D, E.

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of polysorbate 80.

B. It complies with the test for hydroxyl value (see Tests).

C. It complies with the test for saponification value (see Tests).

D. It complies with the test for composition of fatty acids (see Tests).

E. Dissolve 0.1 g in 5 ml of methylene chloride *R*. Add 0.1 g of potassium thiocyanate *R* and 0.1 g of cobalt nitrate *R*. Stir with a glass rod. The solution becomes blue.

TESTS

Acid value (2.5.1): maximum 2.0.

Dissolve 5.0 g in 50 ml of the prescribed mixture of solvents.

Hydroxyl value (2.5.3, Method A): 65 to 80.

Peroxide value: maximum 10.0.

Introduce 10.0 g into a 100 ml beaker, dissolve with glacial acetic acid *R* and dilute to 20 ml with the same solvent. Add 1 ml of saturated potassium iodide solution *R* and allow to stand for 1 min. Add 50 ml of carbon dioxide-free water *R* and a magnetic stirring bar. Titrate with 0.01 *M* sodium thiosulphate, determining the end-point potentiometrically (2.2.20). Carry out a blank titration.

Determine the peroxide value using the following expression:

$$\frac{(n_1 - n_2) \times M \times 1000}{m}$$

n_1 = volume of 0.01 *M* sodium thiosulphate required for the substance to be examined, in millilitres,

n_2 = volume of 0.01 *M* sodium thiosulphate required for the blank, in millilitres,

M = molarity of the sodium thiosulphate solution, in moles per litre,

m = mass of substance to be examined, in grams.

Saponification value (2.5.6): 45 to 55, determined on 4.0 g. Use 15.0 ml of 0.5 *M* alcoholic potassium hydroxide and dilute with 50 ml of alcohol *R* before carrying out the titration. Heat under reflux for 60 min.

Composition of fatty acids (2.4.22, Method C). Prepare reference solution (a) as indicated in Table 2.4.22-3.

Column:

- **material:** fused silica,
- **size:** $l = 30$ m, $\varnothing = 0.32$ mm,
- **stationary phase:** macrogol 20 000 *R* (film thickness 0.5 μ m).

Carrier gas: helium for chromatography *R*.

Linear velocity: 50 cm/s.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 14	80 → 220
	14 - 54	220
Injection port		250
Detector		250

Detection: flame ionisation.

Injection: 1 μ l.

Composition of the fatty acid fraction of the substance:

- *myristic acid*: maximum 5.0 per cent,
- *palmitic acid*: maximum 16.0 per cent,
- *palmitoleic acid*: maximum 8.0 per cent,
- *stearic acid*: maximum 6.0 per cent,
- *oleic acid*: 58.0 per cent to 85.0 per cent,
- *linoleic acid*: maximum 18.0 per cent,
- *linolenic acid*: maximum 4.0 per cent,

Ethylene oxide and dioxan (2.4.25, *Method A*): maximum 1 ppm of ethylene oxide and maximum 10 ppm of dioxan.

Heavy metals (2.4.8): maximum 10 ppm.

2.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) R.

Water (2.5.12): maximum 3.0 per cent, determined on 1.00 g.

Total ash (2.4.16): maximum 0.25 per cent, determined on 2.0 g.

STORAGE

In an airtight container, protected from light.

01/2005:1962

POLY(VINYL ACETATE)

Poly(vinylis acetat)

**DEFINITION**

Poly(vinyl acetate) is a thermoplastic polymer obtained by polymerisation of vinyl acetate using a suitable starter, without solvent or with water or 2-propanol. The vast majority of the acetate moieties are attached to non-neighbouring carbon atoms of the chain.

The index *n* is about 100 - 17 000. The relative molecular mass lies between 10 000 and 1500 000. The viscosity is 4 to 250 mPas. The ester value, which characterises the degree of hydrolysis, is 615 to 675.

CHARACTERS

Appearance: white powder or colourless granules or beads.

Solubility: practically insoluble in water, freely soluble in ethyl acetate, soluble in alcohol. It is hygroscopic and swells in water.

It softens at temperatures above 40-50 °C.

IDENTIFICATION**A. Infrared absorption spectrophotometry** (2.2.24).

Preparation: discs prepared as follows: dissolve about 200 mg in 5 ml of *acetone* R, place 2 drops on a *potassium bromide* R disc and dry to evaporate the solvent.

The spectrum obtained shows absorption maxima corresponding to poly(vinyl acetate) at 1750 cm⁻¹, 1400 cm⁻¹ and 1020 cm⁻¹.

B. It complies with the test for viscosity (see Tests).**C. Saponify** 0.500 g in a mixture of 25.0 ml of 0.5 M *alcoholic potassium hydroxide* R and 25.0 ml of *water* R (2.5.6). The solution obtained gives the reaction of acetates (2.3.1).**TESTS**

Solution S. Suspend 50.0 g in 100 ml of *ethyl acetate* R in a borosilicate glass flask with a ground-glass neck. Heat under a reflux condenser with constant stirring for 30 min. Allow to cool. Filter through a tared sintered glass filter (No. 16) and wash the residue with 50.0 ml of *ethyl acetate* R, pour the filtrate into a 250 ml graduated flask. Dilute to 250 ml with *ethyl acetate* R.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method I*).

Viscosity (2.2.49): 85 per cent to 115 per cent of the value stated on the label.

Determine the viscosity immediately after preparation of solution S at 20 ± 0.1 °C by using a rolling ball viscosimeter.

Acid value (2.5.1): maximum 2.0, determined on 5.0 g dissolved in 50 ml of *alcohol* R by shaking for 3 h.

Ester value (2.5.2): 615 to 675.

Saponify 0.500 g in a mixture of 25.0 ml of 0.5 M *alcoholic potassium hydroxide* and 25.0 ml of *water* R (2.5.6).

Residual peroxides: maximum 100 ppm, calculated as hydrogen peroxide.

Place 0.85 g in a borosilicate glass flask with a ground-glass neck. Add 10 ml of *ethyl acetate* R and heat under a reflux condenser with constant agitation. Allow to cool. Replace the air in the container with *oxygen-free nitrogen* R and add a solution of 1 ml of *glacial acetic acid* R and 0.5 g of *sodium iodide* R in 40 ml of *water* R. Shake thoroughly and allow to stand protected from light for 20 min. Titrate with 0.005 M *sodium thiosulphate* R until the yellow colour is discharged. Carry out a blank titration. The difference between the titration volumes is not greater than 1.0 ml.

Vinyl acetate. Head-space gas chromatography (2.2.28).

Reference solution. Place 15 ml of *dimethylformamide* R in a 20 ml vial, add 45 µl of *vinyl acetate* R and 50.0 µl of *butanal* R and dilute to volume with *dimethylformamide* R. Dilute 1 ml of the solution to 10 ml with *dimethylformamide* R.

Test solution (a). Place 0.2000 g of the substance to be examined in a 20 ml vial and add 1.00 ml of *dimethylformamide* R. Close the vial and secure the stopper. Shake, avoiding contact between the stopper and the liquid.

Test solution (b). Place 0.2000 g of the substance to be examined in a 20 ml vial and add 1.00 ml of the reference solution. Close the vial and secure the stopper. Shake, avoiding contact between the stopper and the liquid.

Column:

- **material:** fused silica,
- **size:** *l* = 25 m, Ø = 0.32 mm,
- **stationary phase:** poly(dimethyl)(diphenyl)(divinyl)siloxane R (film thickness: 0.32 µm),

Carrier gas: *nitrogen for chromatography* R.

Flow rate: 20 ml/min.

Static head-space conditions which may be used:

- **equilibration temperature:** 60 °C,
- **equilibration time:** 20 min,
- **transfer-line temperature:** 120 °C,
- **carrier gas:** *nitrogen for chromatography* R.

Temperature:

- **column:** 155 °C,
- **injection port:** 120 °C,
- **detector:** 180 °C.

Detection: flame ionisation.

Sulphated ash (2.4.14): maximum 1.0 per cent, determined on 1.0 g.

The following test concerning the pharmacotechnological properties may be carried out depending on the intended formulation. It is not a mandatory requirement.

Infrared absorption spectrum (2.2.24). The determination of the spectrum and comparison with a suitable sample is useful for ensuring suitable functionality-related properties. The intensities of the absorption maxima at 1720 cm^{-1} and 1260 cm^{-1} are inversely proportional to the degree of hydrolysis.

LABELLING

The label states:

- the viscosity for a 40 g/l solution,
- the ester value.

01/2005:1139
corrected

POTASSIUM ACETATE

Kalii acetas

$\text{C}_2\text{H}_3\text{KO}_2$

M_r 98.1

DEFINITION

Potassium acetate contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of $\text{C}_2\text{H}_3\text{KO}_2$, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder or colourless crystals, deliquescent, very soluble in water, freely soluble in alcohol.

IDENTIFICATION

- It gives reaction (a) of acetates (2.3.1).
- It gives reaction (a) of potassium (2.3.1).

TESTS

Solution S. Dissolve 10.0 g in *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent. The pH of the solution is 7.5 to 9.0.

Reducing substances. Dilute 10 ml of solution S to 100 ml with *water R*. Add 5 ml of *dilute sulphuric acid R* and 0.5 ml of a 0.32 g/l solution of *potassium permanganate R*. Mix and boil gently for 5 min. The solution remains pink.

Chlorides (2.4.4). Dilute 2.5 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides (200 ppm).

Sulphates (2.4.13). Dilute 7.5 ml of solution S to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (200 ppm).

Aluminium (2.4.17). If intended for use in the manufacture of peritoneal dialysis solutions, haemofiltration solutions or haemodialysis solutions, it complies with the test for aluminium. Dissolve 2.0 g in 50 ml of *water R* and add 5 ml of *acetate buffer solution pH 6.0 R*. The solution complies with the limit test for aluminium (1 ppm). Use as a reference

solution a mixture of 1 ml of *aluminium standard solution (2 ppm Al) R*, 5 ml of *acetate buffer solution pH 6.0 R* and 49 ml of *water R*. To prepare the blank use a mixture of 5 ml of *acetate buffer solution pH 6.0 R* and 50 ml of *water R*.

Iron (2.4.9). Dilute 5 ml of solution S to 10 ml with *water R*. The solution complies with the limit test for iron (20 ppm).

Heavy metals (2.4.8). Dissolve 5.0 g in *water R* and dilute to 20 ml with the same solvent. 12 ml of the solution complies with limit test A for heavy metals (4 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Sodium. Not more than 0.5 per cent of Na, determined by atomic emission spectrometry (2.2.22, *Method II*).

Test solution. Dissolve 1.00 g in *water R* and dilute to 100.0 ml with the same solvent.

Reference solutions. Prepare the reference solutions using *sodium standard solution (200 ppm Na) R*, diluted as necessary with *water R*.

Measure the emission intensity at 589 nm.

Loss on drying (2.2.32). Not more than 3.0 per cent, determined on 1.000 g by drying in an oven at $100\text{ }^\circ\text{C}$ to $105\text{ }^\circ\text{C}$.

ASSAY

Dissolve 80.0 mg in 20 ml of *anhydrous acetic acid R*. Add 0.2 ml of *naphtholbenzein solution R*. Titrate with 0.1 M *perchloric acid*. Carry out a blank titration.

1 ml of 0.1 M *perchloric acid* is equivalent to 9.81 mg of $\text{C}_2\text{H}_3\text{KO}_2$.

STORAGE

Store in an airtight container.

01/2005:0184

POTASSIUM BROMIDE

Kalii bromidum

KBr

M_r 119.0

DEFINITION

Content: 98.0 per cent to 100.5 per cent (dried substance).

CHARACTERS

Appearance: white, crystalline powder or colourless crystals.

Solubility: freely soluble in water and in glycerol, slightly soluble in alcohol.

IDENTIFICATION

- It gives reaction (a) of bromides (2.3.1).
- Solution S (see Tests) gives the reactions of potassium (2.3.1).

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.5 ml of 0.01 M *hydrochloric acid* or 0.01 M *sodium hydroxide* is required to change the colour of the indicator.

01/2005:1557

POTASSIUM CARBONATE

Kalii carbonas

 M_r 138.2

DEFINITION

Potassium carbonate contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of K_2CO_3 , calculated with reference to the dried substance.

CHARACTERS

A white granular powder, hygroscopic, freely soluble in water, practically insoluble in alcohol.

IDENTIFICATION

- Dissolve 1 g in 10 ml of *water R*. The solution is strongly alkaline (2.2.4).
- 2 ml of the solution prepared for identification test A gives the reaction of carbonates and bicarbonates (2.3.1).
- 1 ml of the solution prepared for identification test A gives reaction (b) of potassium (2.3.1).

TESTS

Solution S. Dissolve 10.0 g in 25 ml of *distilled water R*. Slowly add 14 ml of *hydrochloric acid R*. When the effervescence has ceased, boil for a few minutes. Allow to cool and dilute to 50 ml with *distilled water R*.

Appearance of solution. Solution S is not more opalescent than reference suspension II (2.2.1) and not more intensely coloured than reference solution Y_6 (2.2.2, *Method II*).

Chlorides (2.4.4). Dissolve 0.50 g in 10 ml of *water R*. Carefully add dropwise 1 ml of *nitric acid R*. Boil. Cool, add 5 ml of *dilute nitric acid R* and dilute to 15 ml with *water R*. The solution complies with the limit test for chlorides (100 ppm).

Sulphates (2.4.13). Dilute 7.50 ml of solution S to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (100 ppm).

Calcium (2.4.3). To 5 ml of solution S, add 1 ml of *concentrated ammonia R*. Boil. Cool. Dilute to 15 ml with *distilled water R*. The solution complies with the limit test for calcium (100 ppm).

Iron (2.4.9). 5 ml of solution S diluted to 10 ml with *water R* complies with the limit test for iron (10 ppm).

Heavy metals (2.4.8). Dilute 10 ml of solution S to 20 ml with *water R*. 12 ml of the solution complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution* (2 ppm Pb) *R*.

Loss on drying (2.2.32). Not more than 5.0 per cent, determined on 0.300 g by drying in an oven at 120 °C to 125 °C for 5 h.

ASSAY

Dissolve 0.500 g in 50 ml of *carbon dioxide-free water R*. Carry out a potentiometric titration (2.2.20), using 1 M *hydrochloric acid*. Read the volume added at the second point of inflexion.

1 ml of 1 M *hydrochloric acid* is equivalent to 69.1 mg of K_2CO_3 .

STORAGE

Store in an airtight container.

Bromates. To 10 ml of solution S add 1 ml of *starch solution R*, 0.1 ml of a 100 g/l solution of *potassium iodide R* and 0.25 ml of 0.5 M *sulphuric acid* and allow to stand protected from light for 5 min. No blue or violet colour develops.

Chlorides: maximum 0.6 per cent.

In a conical flask, dissolve 1.000 g in 20 ml of *dilute nitric acid R*. Add 5 ml of *strong hydrogen peroxide solution R* and heat on a water-bath until the solution is completely decolorised. Wash down the sides of the flask with a little *water R* and heat on a water-bath for 15 min. Allow to cool, dilute to 50 ml with *water R* and add 5.0 ml of 0.1 M *silver nitrate* and 1 ml of *dibutyl phthalate R*. Shake and titrate with 0.1 M *ammonium thiocyanate*, using 5 ml of *ferric ammonium sulphate solution R2* as indicator. Not more than 1.7 ml of 0.1 M *silver nitrate* is used. Note the volume of 0.1 M *silver nitrate* used (see Assay). Carry out a blank test.

Iodides. To 5 ml of solution S add 0.15 ml of *ferric chloride solution R1* and 2 ml of *methylene chloride R*. Shake and allow to separate. The lower layer is colourless (2.2.2, *Method I*).

Sulphates (2.4.13): maximum 100 ppm.

15 ml of solution S complies with the limit test for sulphates.

Iron (2.4.9): maximum 20 ppm.

5 ml of solution S diluted to 10 ml with *water R* complies with the limit test for iron.

Magnesium and alkaline-earth metals (2.4.7): maximum 200 ppm, calculated as Ca.

10.0 g complies with the limit test for magnesium and alkaline-earth metals. The volume of 0.01 M *sodium edetate* used does not exceed 5.0 ml.

Heavy metals (2.4.8): maximum 10 ppm.

12 ml of solution S complies with limit test A. Prepare the standard using *lead standard solution* (1 ppm Pb) *R*.

Loss on drying (2.2.32): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 100–105 °C for 3 h.

ASSAY

Dissolve 2.000 g in *water R* and dilute to 100.0 ml with the same solvent. To 10.0 ml of the solution add 50 ml of *water R*, 5 ml of *dilute nitric acid R*, 25.0 ml of 0.1 M *silver nitrate* and 2 ml of *dibutyl phthalate R*. Shake. Titrate with 0.1 M *ammonium thiocyanate*, using 2 ml of *ferric ammonium sulphate solution R2* as indicator and shaking vigorously towards the end-point.

1 ml of 0.1 M *silver nitrate* is equivalent to 11.90 mg of KBr.

Calculate the percentage content of KBr from the expression:

$$a - 3.357 b$$

a = percentage content of KBr and KCl obtained in the assay and calculated as KBr,

b = percentage content of Cl in the test for chlorides.

01/2005:0185

POTASSIUM CHLORIDE

Kalii chloridum

KCl

 M_r 74.6

DEFINITION

Potassium chloride contains not less than 99.0 per cent and not more than the equivalent of 100.5 per cent of KCl, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder or colourless crystals, freely soluble in water, practically insoluble in ethanol.

IDENTIFICATION

- A. It gives the reactions of chlorides (2.3.1).
B. Solution S (see Tests) gives the reactions of potassium (2.3.1).

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 50 ml of solution S add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.5 ml of 0.01 M *hydrochloric acid* or 0.01 M *sodium hydroxide* is required to change the colour of the indicator.

Bromides. Dilute 1.0 ml of solution S to 50 ml with *water R*. To 5.0 ml of the solution add 2.0 ml of *phenol red solution R2* and 1.0 ml of *chloramine solution R1* and mix immediately. After exactly 2 min add 0.15 ml of 0.1 M *sodium thiosulphate*, mix and dilute to 10.0 ml with *water R*. The absorbance (2.2.25) of the solution measured at 590 nm, using *water R* as the compensation liquid, is not greater than that of a standard prepared at the same time and in the same manner using 5 ml of a 3.0 mg/l solution of *potassium bromide R* (0.1 per cent).

Iodides. Moisten 5 g by the dropwise addition of a freshly prepared mixture of 0.15 ml of *sodium nitrite solution R*, 2 ml of 0.5 M *sulphuric acid*, 25 ml of *iodide-free starch solution R* and 25 ml of *water R*. After 5 min, examine in daylight. The substance shows no blue colour.

Sulphates (2.4.13). 5 ml of solution S diluted to 15 ml with *distilled water R* complies with the limit test for sulphates (300 ppm).

Barium. To 5 ml of solution S add 5 ml of *distilled water R* and 1 ml of *dilute sulphuric acid R*. After 15 min, any opalescence in the solution is not more intense than that in a mixture of 5 ml of solution S and 6 ml of *distilled water R*.

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb R)*.

Iron (2.4.9). 5 ml of solution S diluted to 10 ml with *water R* complies with the limit test for iron (20 ppm).

Magnesium and alkaline-earth metals (2.4.7). 10.0 g complies with the limit test for magnesium and alkaline-earth metals. The volume of 0.01 M *sodium edetate* used does not exceed 5.0 ml (200 ppm, calculated as Ca).

Sodium. If intended for use in the manufacture of parenteral dosage forms or haemodialysis solutions, it complies with the test for sodium. Not more than 0.1 per cent of Na, determined by atomic emission spectrometry (2.2.22).

Test solution. Dissolve 1.00 g of the substance to be examined in *water R* and dilute to 100.0 ml with the same solvent.

Reference solutions. Dissolve in *water R* 0.5084 g of *sodium chloride R*, previously dried at 100 °C to 105 °C for 3 h, and dilute to 1000.0 ml with the same solvent (200 µg of Na per millilitre). Dilute as required.

Measure the emission intensity at 589 nm.

Aluminium (2.4.17). If intended for use in the manufacture of haemodialysis solutions, it complies with the test for aluminium. Dissolve 4 g in 100 ml of *water R* and add 10 ml of *acetate buffer solution pH 6.0 R*. The solution complies with the limit test for aluminium (1 ppm). Use as the reference solution a mixture of 2 ml of *aluminium standard solution (2 ppm Al) R*, 10 ml of *acetate buffer solution pH 6.0 R* and 98 ml of *water R*. To prepare the blank use a mixture of 10 ml of *acetate buffer solution pH 6.0 R* and 100 ml of *water R*.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 3 h.

ASSAY

Dissolve 1.300 g in *water R* and dilute to 100.0 ml with the same solvent. To 10.0 ml of the solution add 50 ml of *water R*, 5 ml of *dilute nitric acid R*, 25.0 ml of 0.1 M *silver nitrate* and 2 ml of *dibutyl phthalate R*. Shake. Titrate with 0.1 M *ammonium thiocyanate*, using 2 ml of *ferric ammonium sulphate solution R2* as indicator and shaking vigorously towards the end-point.

1 ml of 0.1 M *silver nitrate* is equivalent to 7.46 mg of KCl.

LABELLING

The label states:

- where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms,
- where applicable, that the substance is suitable for use in the manufacture of haemodialysis solutions.

01/2005:0400

POTASSIUM CITRATE

Kalii citras

 $\text{C}_6\text{H}_5\text{K}_3\text{O}_7 \cdot \text{H}_2\text{O}$ M_r 324.4

DEFINITION

Potassium citrate contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of tripotassium 2-hydroxypropane-1,2,3-tricarboxylate, calculated with reference to the anhydrous substance.

CHARACTERS

A white, granular powder or transparent crystals, hygroscopic, very soluble in water, practically insoluble in alcohol.

IDENTIFICATION

- A. To 1 ml of solution S (see Tests) add 4 ml of *water R*. The solution gives the reaction of citrates (2.3.1).

B. 0.5 ml of solution S gives reaction (b) of potassium (2.3.1).

01/2005:1140

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *phenolphthalein solution R*. Not more than 0.2 ml of 0.1 M *hydrochloric acid* or 0.1 M *sodium hydroxide* is required to change the colour of the indicator.

Readily carbonisable substances. To 0.20 g of the powdered substance to be examined add 10 ml of *sulphuric acid R* and heat in a water-bath at 90 ± 1 °C for 60 min. Cool rapidly. The solution is not more intensely coloured than reference solution Y₂ or GY₂ (2.2.2, *Method II*).

Chlorides (2.4.4). Dilute 10 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides (50 ppm).

Oxalates. Dissolve 0.50 g in 4 ml of *water R*, add 3 ml of *hydrochloric acid R* and 1 g of granulated *zinc R* and heat on a water-bath for 1 min. Allow to stand for 2 min, decant the liquid into a test-tube containing 0.25 ml of a 10 g/l solution of *phenylhydrazine hydrochloride R* and heat to boiling. Cool rapidly, transfer to a graduated cylinder and add an equal volume of *hydrochloric acid R* and 0.25 ml of *potassium ferricyanide solution R*. Shake and allow to stand for 30 min. Any pink colour in the solution is not more intense than that in a standard prepared at the same time and in the same manner using 4 ml of a 0.05 g/l solution of *oxalic acid R* (300 ppm).

Sulphates (2.4.13). To 10 ml of solution S add 2 ml of *hydrochloric acid R1* and dilute to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (150 ppm).

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Sodium. Not more than 0.3 per cent of Na, determined by atomic emission spectrometry (2.2.22, *Method II*).

Test solution. To 10 ml of solution S add 1 ml of *dilute hydrochloric acid R* and dilute to 100 ml with *distilled water R*.

Reference solutions. Dilute as necessary with *distilled water R* a solution of *sodium chloride R* containing 1 mg of Na per millilitre.

Measure the emission intensity at 589 nm.

Water (2.5.12): 4.0 per cent to 7.0 per cent, determined on 0.500 g by the semi-micro determination of water. After adding the substance to be examined, stir for 15 min before titrating.

ASSAY

Dissolve 0.150 g in 20 ml of *anhydrous acetic acid R*, heating to about 50 °C. Allow to cool. Titrate with 0.1 M *perchloric acid* using 0.25 ml of *naphtholbenzein solution R* as indicator until a green colour is obtained.

1 ml of 0.1 M *perchloric acid* is equivalent to 10.21 mg of C₈H₈K₃O₇.

STORAGE

Store in an airtight container.

POTASSIUM CLAVULANATE

Kalii clavulanas

C₈H₈KNO₅

M_r 237.3

DEFINITION

Potassium (2R,3Z,5R)-3-(2-hydroxyethylidene)-7-oxo-4-oxa-1-azabicyclo[3.2.0]heptane-2-carboxylate, the potassium salt of a substance produced by the growth of certain strains of *Streptomyces clavuligerus* or obtained by any other means. *Content*: 96.5 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder, hygroscopic.

Solubility: freely soluble in water, slightly soluble in alcohol, very slightly soluble in acetone.

PRODUCTION

The method of production, extraction and purification are such that clavam-2-carboxylate is eliminated or present at a level not exceeding 0.01 per cent.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: *Ph. Eur. reference spectrum of potassium clavulanate*.

B. It gives reaction (b) of potassium (2.3.1).

TESTS

Solution S. Dissolve 0.400 g in *carbon dioxide-free water R* and dilute to 20.0 ml with the same solvent.

pH (2.2.3): 5.5 to 8.0.

Dilute 5 ml of solution S to 10 ml with *carbon dioxide-free water R*.

Specific optical rotation (2.2.7): + 53 to + 63 (anhydrous substance), determined on solution S.

Absorbance (2.2.25): maximum 0.40 at 278 nm.

Dissolve 50.0 mg in 0.1 M *phosphate buffer solution pH 7.0 R* and dilute to 50.0 ml with the same solution. Measure immediately the absorbance of this solution.

Related substances. Liquid chromatography (2.2.29). *Prepare the solutions immediately before use.*

Test solution. Dissolve 0.250 g of the substance to be examined in mobile phase A and dilute to 25.0 ml with mobile phase A.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase A.

Reference solution (b). Dissolve 10 mg of *lithium clavulanate CRS* and 10 mg of *amoxicillin trihydrate CRS* in mobile phase A and dilute to 100 ml with mobile phase A.

Column:

- *size*: $l = 0.10$ m, $\varnothing = 4.6$ mm,
- *stationary phase*: octadecylsilyl silica gel for chromatography R (5 μ m),
- *temperature*: 40 °C.

Mobile phase:

- **mobile phase A:** a 7.8 g/l solution of *sodium dihydrogen phosphate R* adjusted to pH 4.0 with *phosphoric acid R* and filtered through a 0.5 µm filter,
- **mobile phase B:** a mixture of equal volumes of mobile phase A and *methanol R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 4	100	0
4 - 15	100 → 50	0 → 50
15 - 18	50	50
18 - 24	50 → 100	50 → 0
24 - 39	100	0

Flow rate: 1 ml/min.

Detection: spectrophotometer at 230 nm.

Injection: 20 µl.

System suitability: reference solution (b):

- **resolution:** minimum 13 between the first peak (clavulanate) and the second peak (amoxicillin).

Limits:

- **any impurity:** not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent),
- **total:** not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent),
- **disregard limit:** 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Aliphatic amines. Gas chromatography (2.2.28).

The method shown below can be used to determine the following aliphatic amines: 1,1-dimethylethylamine; diethylamine; *N,N,N',N'*-tetramethylethylenediamine; 1,1,3,3-tetramethylbutylamine; *N,N'*-diisopropylethylenediamine; 2,2'-oxydi(*N,N*)dimethylethylamine.

Internal standard solution: dissolve 50 µl of 3-methylpentan-2-one *R* in *water R* and dilute to 100.0 ml with the same solvent.

Test solution. Weigh 1.00 g of the substance to be examined into a centrifuge tube. Add 5.0 ml of the internal standard solution, 5.0 ml of *dilute sodium hydroxide solution R*, 10.0 ml of *water R*, 5.0 ml of 2-methylpropanol *R* and 5 g of *sodium chloride R*. Shake vigorously for 1 min. Centrifuge to separate the layers.

Reference solution. Dissolve 80.0 mg of each of the following amines 1,1-dimethylethylamine *R*; diethylamine *R*; tetramethylethylenediamine *R*; 1,1,3,3-tetramethylbutylamine *R*; *N,N'*-diisopropylethylenediamine *R* and 2,2'-oxybis(*N,N*-dimethylethylamine) *R* in *dilute hydrochloric acid R* and dilute to 200.0 ml with the same acid. Introduce 5.0 ml of this solution into a centrifuge tube. Add 5.0 ml of the internal standard solution, 10.0 ml of *dilute sodium hydroxide solution R*, 5.0 ml of 2-methylpropanol *R* and 5 g of *sodium chloride R*. Shake vigorously for 1 min. Centrifuge to separate the layers.

Column:

- **material:** fused silica,
- **size:** *l* = 50 m, Ø = 0.53 mm,
- **stationary phase:** poly(dimethyl)(diphenyl)siloxane *R* (film thickness 5 µm).

Carrier gas: helium for chromatography *R*.

Flow rate: 8 ml/min.

Split ratio: 1:10.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 7	35
	7 - 10.8	35 → 150
	10.8 - 25.8	150
Injection port		200
Detector		250

Detection: flame ionisation.

Injection: 1 µl of the upper layers obtained from test solution and reference solution.

Relative retention with reference to 3-methylpentan-2-one (retention time = about 11.4 min): impurity H = about 0.55; impurity I = about 0.76; impurity J = about 1.07; impurity K = about 1.13; impurity L = about 1.33; impurity M = about 1.57.

Limit:

- **aliphatic amines:** maximum 0.2 per cent.

2-Ethylhexanoic acid (2.4.28): maximum 0.8 per cent.

Water (2.5.12): maximum 0.5 per cent, determined on 1.00 g.

Bacterial endotoxins (2.6.14): less than 0.03 IU/mg if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (2.2.29). *Prepare the solutions immediately before use.*

Test solution. Dissolve 50.0 mg of the substance to be examined in a 4.1 g/l solution of *sodium acetate R* previously adjusted to pH 6.0 with *glacial acetic acid R*, and dilute to 50.0 ml with the same solution.

Reference solution (a). Dissolve 50.0 mg of *lithium clavulanate CRS* in a 4.1 g/l solution of *sodium acetate R* previously adjusted to pH 6.0 with *glacial acetic acid R* and dilute to 50.0 ml with the same solution.

Reference solution (b). Dissolve 50.0 mg of *lithium clavulanate CRS* and 50.0 mg of *amoxicillin trihydrate CRS* in a 4.1 g/l solution of *sodium acetate R* previously adjusted to pH 6.0 with *glacial acetic acid R* and dilute to 50.0 ml with the same solution.

Column:

- **size:** *l* = 0.3 m, Ø = 4.6 mm,
- **stationary phase:** octadecylsilyl silica gel for chromatography *R* (5 µm).

Mobile phase: mix 5 volumes of *methanol R1* and 95 volumes of a 15 g/l solution of *sodium dihydrogen phosphate R* previously adjusted to pH 4.0 with *dilute phosphoric acid R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 230 nm.

Injection: 10 µl.

System suitability: reference solution (b):

- **resolution:** minimum 3.5 between the first peak (clavulanate) and the second peak (amoxicillin).

1 mg of clavulanate (C₈H₉NO₅) is equivalent to 1.191 mg of C₈H₈KNO₅.

STORAGE

In an airtight container, at a temperature of 2 °C to 8 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

Specified impurities: A, B, C, D, G, H, I, J, K, L, M.

Other detectable impurities: E, F.

By liquid chromatography: A, B, C, D, E, F, G.

By gas chromatography: H, I, J, K, L, M.

A. R = H: 2,2'-(pyrazine-2,5-diyl)diethanol,

B. R = CH₂-CH₂-CO₂H: 3-[3,6-bis(2-hydroxyethyl)pyrazin-2-yl]propanoic acid,

C. R = CH₂-CH₃: 2,2'-(3-ethylpyrazine-2,5-diyl)diethanol,

D. 4-(2-hydroxyethyl)pyrrole-3-carboxylic acid,

E. (2*R*,4*R*,5*Z*)-2-(carboxymethyl)-5-(2-hydroxyethylidene)-3-[[[(2*R*,3*Z*,5*R*)-3-(2-hydroxyethylidene)-7-oxo-4-oxa-1-azabicyclo[3.2.0]hept-2-yl]carbonyl]oxazolidine-4-carboxylic acid,

F. 4-[[[4-(2-hydroxyethyl)-1*H*-pyrrol-3-yl]carbonyl]oxy]methyl]-1*H*-pyrrole-3-carboxylic acid,

G. 4-[[[(1*S*)-1-carboxy-2-(4-hydroxyphenyl)ethyl]amino]-4-oxobutanoic acid (*N*-succinyltyrosine),

H. 2-amino-2-methylpropane (1,1-dimethylethylamine),

I. diethylamine,

J. 1,2-bis(dimethylamino)ethane (*N,N,N',N'*-tetramethylethylenediamine),

K. 2-amino-2,4,4-trimethylpentane (1,1,3,3-tetramethylbutylamine),

L. *N,N'*-bis(1-methylethyl)-1,2-ethanediamine (*N,N'*-diisopropylethylenediamine),

M. bis(2-dimethylamino)ethyl ether [2,2'-oxybis(*N,N*-dimethylethylamine)].

POTASSIUM CLAVULANATE, DILUTED

Kalii clavulanate dilutus

C₈H₈KNO₅

M_r 237.3

DEFINITION

Dry mixture of *Potassium clavulanate* (1140) and *Cellulose, microcrystalline* (0316) or *Silica, colloidal anhydrous* (0434) or *Silica, colloidal hydrated* (0738).

Content: 91.2 per cent to 107.1 per cent of the content of potassium clavulanate stated on the label.

CHARACTERS

Appearance of diluted potassium clavulanate: white or almost white powder, hygroscopic.

Solubility of potassium clavulanate: freely soluble in water, slightly soluble in alcohol, very slightly soluble in acetone.

The solubility of the diluted product depends on the diluent and its concentration.

IDENTIFICATION

A. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

- B. It gives reaction (b) of potassium (2.3.1).
- C. Depending on the diluent used, carry out the corresponding identification test (a) or (b).
- (a) A quantity of the substance to be examined, corresponding to 20 mg of cellulose, when placed on a watch-glass and dispersed in 4 ml of *iodinated zinc chloride solution R*, becomes violet-blue.
- (b) It gives the reaction of silicates (2.3.1).

TESTS

pH (2.2.3): 4.8 to 8.0.

Suspend a quantity of the substance to be examined corresponding to 0.200 g of potassium clavulanate in 20 ml of *carbon dioxide-free water R*.

Absorbance (2.2.25): maximum 0.40 measured immediately at 278 nm.

Disperse a quantity of the substance to be examined corresponding to 50.0 mg of potassium clavulanate in 10 ml of *0.1 M phosphate buffer solution pH 7.0 R*, dilute to 50.0 ml with the same buffer solution and filter.

Related substances. Liquid chromatography (2.2.29). *Prepare the solutions immediately before use.*

Test solution. Disperse a quantity of the substance to be examined corresponding to 0.250 g of potassium clavulanate in 5 ml of mobile phase A, dilute to 25.0 ml with mobile phase A and filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase A.

Reference solution (b). Dissolve 10 mg of *amoxicillin trihydrate CRS* in 1 ml of the test solution and dilute to 100 ml with mobile phase A.

Column:

- *size*: $l = 0.10$ m, $\varnothing = 4.6$ mm,
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 μ m),
- *temperature*: 40 °C.

Mobile phase:

- *mobile phase A*: 7.8 g/l solution of *sodium dihydrogen phosphate R* adjusted to pH 4.0 with *dilute phosphoric acid R*,
- *mobile phase B*: mixture of equal volumes of mobile phase A and *methanol R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 4	100	0
4 - 15	100 → 50	0 → 50
15 - 18	50	50
18 - 24	50 → 100	50 → 0
24 - 39	100	0

Flow rate: 1 ml/min.

Detection: spectrophotometer at 230 nm.

Injection: 20 μ l.

System suitability: reference solution (b):

- *resolution*: minimum of 13 between the peak due to clavulanate (1st peak) and the peak due to amoxicillin (2nd peak).

Limits:

- *any impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent),

- *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent),
- *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Water (2.5.12): maximum 2.5 per cent, determined on 1.000 g.

ASSAY

Liquid chromatography (2.2.29). *Prepare the solutions immediately before use.*

Test solution. Disperse a quantity of the substance to be examined corresponding to 50.0 mg of potassium clavulanate in a 4.1 g/l solution of *sodium acetate R* previously adjusted to pH 6.0 with *glacial acetic acid R*, dilute to 50.0 ml with the same solution and filter.

Reference solution (a). Dissolve 50.0 mg of *lithium clavulanate CRS* in a 4.1 g/l solution of *sodium acetate R* previously adjusted to pH 6.0 with *glacial acetic acid R* and dilute to 50.0 ml with the same solution.

Reference solution (b). Dissolve 10 mg of *amoxicillin trihydrate CRS* in 10 ml of reference solution (a).

Column:

- *size*: $l = 0.3$ m, $\varnothing = 4.6$ mm,
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (10 μ m).

Mobile phase: mix 5 volumes of *methanol R1* and 95 volumes of a 15 g/l solution of *sodium dihydrogen phosphate R* previously adjusted to pH 4.0 with *dilute phosphoric acid R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 230 nm.

Injection: 10 μ l.

System suitability: reference solution (b):

- *resolution*: minimum 3.5 between the peak due to clavulanate (1st peak) and the peak due to amoxicillin (2nd peak).

1 mg of $C_8H_9NO_5$ is equivalent to 1.191 mg of $C_8H_8KNO_5$.

STORAGE

In an airtight container.

LABELLING

The label states the *m/m* percentage content of potassium clavulanate and the diluent used to prepare the mixture.

IMPURITIES

Specified impurities: A, B, C, D, G.

Other detectable impurities: E, F.

- A. R = H: 2,2'-(pyrazine-2,5-diyl)diethanol,
- B. R = $CH_2CH_2CO_2H$: 3-[3,6-bis(2-hydroxyethyl)pyrazin-2-yl]propanoic acid,
- C. R = CH_2CH_3 : 2,2'-(3-ethylpyrazine-2,5-diyl)diethanol,

- D. 4-(2-hydroxyethyl)-1H-pyrrole-3-carboxylic acid,

- E. (2*R*,4*R*,5*Z*)-2-(carboxymethyl)-5-(2-hydroxyethylidene)-3-[[[(2*R*,3*Z*,5*R*)-3-(2-hydroxyethylidene)-7-oxo-4-oxa-1-azabicyclo[3.2.0]hept-2-yl]carbonyl]oxazolidine-4-carboxylic acid,

- F. 4-[[[4-(2-hydroxyethyl)-1*H*-pyrrol-3-yl]carbonyl]oxy]methyl]-1*H*-pyrrole-3-carboxylic acid,

- G. 4-[[[(1*S*)-1-carboxy-2-(4-hydroxyphenyl)ethyl]amino]-4-oxobutanoic acid (*N*-succinyltyrosine).

01/2005:0920

POTASSIUM DIHYDROGEN PHOSPHATE

Kalii dihydrogenophosphas

KH₂PO₄*M*_r 136.1

DEFINITION

Potassium dihydrogen phosphate contains not less than 98.0 per cent and not more than the equivalent of 100.5 per cent of KH₂PO₄, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder or colourless crystals, freely soluble in water, practically insoluble in alcohol.

IDENTIFICATION

- A. Solution S (see Tests) is faintly acid (2.2.4).
B. Solution S gives reaction (b) of phosphates (2.3.1).
C. 0.5 ml of solution S gives reaction (b) of potassium (2.3.1).

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). To 5 ml of solution S add 5 ml of *carbon dioxide-free water R*. The pH of the solution is 4.2 to 4.5.

Reducing substances. To 5 ml of solution S add 5 ml of *dilute sulphuric acid R* and 0.25 ml of 0.02 *M* *potassium permanganate*. Heat on a water-bath for 5 min. The colour of the permanganate is not completely discharged.

Chlorides (2.4.4). Dilute 2.5 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides (200 ppm).

Sulphates (2.4.13). To 5 ml of solution S add 0.5 ml of *hydrochloric acid R* and dilute to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (300 ppm).

Arsenic (2.4.2). 0.5 g complies with limit test A for arsenic (2 ppm).

Iron (2.4.9). 10 ml of solution S complies with the limit test for iron (10 ppm).

Sodium. If intended for use in the manufacture of parenteral dosage forms, it complies with the test for sodium. Not more than 0.1 per cent of Na, determined by atomic emission spectrometry (2.2.22, *Method I*).

Test solution. Dissolve 1.00 g of the substance to be examined in *water R* and dilute to 100.0 ml with the same solvent.

Reference solution. Dissolve in *water R* 0.5084 g of *sodium chloride R*, previously dried at 100 °C to 105 °C for 3 h, and dilute to 1000.0 ml with the same solvent (200 µg of Na per millilitre). Dilute as necessary.

Measure the emission intensity at 589 nm.

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution* (1 ppm Pb) *R*.

Loss on drying (2.2.32). Not more than 2.0 per cent, determined on 1.000 g by drying in an oven at 125 °C to 130 °C.

ASSAY

Dissolve 1.000 g in 50 ml of *carbon dioxide-free water R*. Titrate with carbonate-free 1 *M* *sodium hydroxide*, determining the end-point potentiometrically (2.2.20).

1 ml of 1 *M* *sodium hydroxide* is equivalent to 0.1361 g of KH₂PO₄.

LABELLING

The label states, where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms.

01/2005:2076

POTASSIUM HYDROGEN ASPARTATE HEMIHYDRATE

Kalii hydrogenoaspartas hemihydricus

C₄H₆KNO₄ · 1/2 H₂O*M*_r 180.2

DEFINITION

Potassium hydrogen (2*S*)-2-aminobutanedioate hemihydrate.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white powder, or white crystalline powder or colourless crystals.

Solubility: very soluble in water, practically insoluble in alcohol and in methylene chloride.

IDENTIFICATION

A. It complies with the test for specific optical rotation (see Tests).

B. Examine the chromatograms obtained in the test for ninhydrin-positive substances.

Results: the principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. It gives reaction (b) of potassium (2.3.1).

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3): 6.0 to 7.5 for solution S.

Specific optical rotation (2.2.7): + 18.0 to + 20.5 (anhydrous substance).

Dissolve 0.50 g in a mixture of equal volumes of *hydrochloric acid R* and *water R* and dilute to 25.0 ml with the same mixture of solvents.

Ninhydrin-positive substances. Thin-layer chromatography (2.2.27).

Test solution (a). Solution S.

Test solution (b). Dilute 1.0 ml of solution S to 10.0 ml with *water R*.

Reference solution (a). Dissolve 25 mg of *potassium hydrogen aspartate hemihydrate CRS* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of test solution (b) to 20.0 ml with *water R*.

Reference solution (c). Dissolve 10 mg of *glutamic acid CRS* and 10 mg of the substance to be examined in *water R* and dilute to 25 ml with the same solvent.

Plate: *TLC silica gel plate R*.

Mobile phase: *glacial acetic acid R*, *water R*, *butanol R* (20:20:60 V/V/V).

Application: 5 µl.

Development: over 2/3 of the plate.

Drying: in air.

Detection: spray with *ninhydrin solution R* and heat at 100-105 °C for 15 min.

System suitability: reference solution (c):

- the chromatogram shows 2 clearly separated principal spots.

Limits: test solution (a):

- *any impurity:* any spot, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Chlorides (2.4.4): maximum 200 ppm.

To 10 ml of solution S add 5 ml of *water R*.

Sulphates (2.4.13): maximum 500 ppm.

To 12 ml of solution S add 3 ml of *distilled water R*.

Ammonium (2.4.1, *Method B*): maximum 200 ppm, determined on 50 mg.

Prepare the standard using 0.1 ml of *ammonium standard solution* (100 ppm NH_4) *R*.

Iron (2.4.9): maximum 30 ppm.

In a separating funnel, dissolve 0.33 g in 10 ml of *dilute hydrochloric acid R*. Shake with 3 quantities, each of 10 ml, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers add 10 ml of *water R* and shake for 3 min. The aqueous layer complies with the limit test for iron.

Heavy metals (2.4.8): maximum 10 ppm.

Dissolve 2.0 g in *water R* and dilute to 20 ml with the same solvent. 12 ml of the solution complies with limit test A. Prepare the standard using *lead standard solution* (1 ppm Pb) *R*.

Water (2.5.12): 4.0 per cent to 6.0 per cent, determined on 0.200 g.

Dissolve the substance to be examined in 10 ml of *formamide R1* and add 10 ml of *anhydrous methanol R*.

ASSAY

Dissolve 70.0 mg in 5 ml of *anhydrous formic acid R*, add 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 8.56 mg of $\text{C}_4\text{H}_6\text{KNO}_4$.

01/2005:1141

POTASSIUM HYDROGEN CARBONATE

Kalii hydrogenocarbonas

 KHCO_3
 M_r 100.1

DEFINITION

Potassium hydrogen carbonate contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of KHCO_3 .

CHARACTERS

A white, crystalline powder or colourless crystals, freely soluble in water, practically insoluble in alcohol. When heated in the dry state or in solution, it is gradually converted to potassium carbonate.

IDENTIFICATION

A. To 5 ml of solution S (see Tests) add 0.1 ml of *phenolphthalein solution R*. A pale pink colour is produced. Heat; gas is evolved and the colour becomes red.

B. It gives the reaction of carbonates and bicarbonates (2.3.1).

C. 1 ml of solution S gives reaction (b) of potassium (2.3.1).

TESTS

Solution S. Dissolve 5.0 g in 90 ml of *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Carbonates. The pH (2.2.3) of freshly prepared solution S is not more than 8.6.

Chlorides (2.4.4). Dilute 7 ml of solution S to 15 ml with *dilute nitric acid R*. The solution complies with the limit test for chlorides (150 ppm).

Sulphates (2.4.13). Dilute 10 ml of solution S to 15 ml with *acetic acid R*. The solution complies with the limit test for sulphates (150 ppm). Prepare the standard using a mixture of 7.5 ml of *sulphate standard solution (10 ppm SO₄) R* and 7.5 ml of *distilled water R*.

Ammonium (2.4.1). 10 ml of solution S diluted to 15 ml with *water R* complies with the limit test for ammonium (20 ppm). Prepare the standard using a mixture of 5 ml of *water R* and 10 ml of *ammonium standard solution (1 ppm NH₄) R*.

Calcium (2.4.3). Dilute 10 ml of solution S to 15 ml with *acetic acid R*. The solution complies with the limit test for calcium (100 ppm). Prepare the standard using 5 ml of *calcium standard solution (10 ppm Ca) R* and 10 ml of *distilled water R*.

Heavy metals (2.4.8). Dissolve 2.0 g in a mixture of 2 ml of *hydrochloric acid R* and 18 ml of *water R*. 12 ml of the solution complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Iron (2.4.9). 10 ml of solution S complies with the limit test for iron (20 ppm).

Sodium. Not more than 0.5 per cent of Na, determined by atomic emission spectrometry (2.2.22, *Method II*).

Test solution. Dissolve 1.00 g in *water R* and dilute to 100.0 ml with the same solvent.

Reference solutions. Prepare the reference solutions using *sodium standard solution (200 ppm Na) R*, diluted as necessary with *water R*.

Measure the emission intensity at 589 nm.

ASSAY

Dissolve 0.800 g in 50 ml of *carbon dioxide-free water R*. Add 0.1 ml of *methyl orange solution R*. Titrate with 1 M *hydrochloric acid* until the yellow colour begins to change to yellowish-pink. Heat cautiously and boil for at least 2 min. The solution becomes yellow. Cool and titrate until a yellowish-red colour is obtained.

1 ml of 1 M *hydrochloric acid* is equivalent to 0.1001 g of KHCO₃.

CHARACTERS

Appearance: white, crystalline powder or colourless crystals.

Solubility: slightly soluble in water, practically insoluble in alcohol. It dissolves in dilute solutions of mineral acids and alkali hydroxides.

IDENTIFICATION

- It complies with the test for specific optical rotation (see Tests).
- Suspend 0.5 g in 50 ml of *water R* and boil until dissolution is complete. Allow to cool (solution A). To 5 ml of solution A, add 0.1 ml of *methyl red solution R*. The solution is red.
- Solution A gives reaction (a) of tartrates (2.3.1).
- Solution A gives reaction (b) of potassium (2.3.1).

TESTS

Specific optical rotation (2.2.7): + 8.0 to + 9.2 (dried substance).

Dissolve 2.50 g in 20 ml of 1 M *hydrochloric acid* with heating. Allow to cool. Dilute to 25.0 ml with *water R*.

Oxalic acid: maximum 500 ppm.

Dissolve 0.43 g in 4 ml of *water R*. Add 3 ml of *hydrochloric acid R* and 1 g of *zinc R* in granules and boil for 1 min. Allow to stand for 2 min. Collect the liquid in a test-tube containing 0.25 ml of a 10 g/l solution of *phenylhydrazine hydrochloride R* and heat to boiling. Cool rapidly, transfer to a graduated cylinder and add an equal volume of *hydrochloric acid R* and 0.25 ml of a 50 g/l solution of *potassium ferricyanide R*. Shake and allow to stand for 30 min. Any pink colour in the solution is not more intense than that in a standard prepared at the same time in the same manner using a mixture of 1 ml of *water R* and 3 ml of a 0.1 g/l solution of *oxalic acid R*.

Chlorides (2.4.4): maximum 500 ppm.

Dissolve 1.0 g with heating in a mixture of 3 ml of *dilute nitric acid R* and 50 ml of *water R*. Dilute to 100 ml with *water R*. Dilute 10 ml of the solution to 15 ml with *water R*. The solution complies with the limit test for chlorides.

Sulphates (2.4.13): maximum 500 ppm.

Suspend 0.30 g in 3.0 ml of *dilute hydrochloric acid R* and dilute to 15 ml with *distilled water R*. Heat until dissolution is complete. The solution complies with the limit test for sulphates.

Barium. Suspend 0.50 g in a mixture of 1.5 ml of *dilute hydrochloric acid R* and 8.5 ml of *water R*. Heat until dissolution is complete. Allow to cool. Add 1 ml of *dilute sulphuric acid R*. The solution remains clear (2.2.1) on standing for 15 min.

Heavy metals (2.4.8): maximum 10 ppm.

2.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C.

ASSAY

Dissolve 0.170 g in 100 ml of *water R* at 100 °C. Titrate the hot solution with 0.1 M *sodium hydroxide*, using 0.3 ml of *phenolphthalein solution R* as indicator.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 18.82 mg of C₄H₅KO₆.

01/2005:1984

POTASSIUM HYDROGEN TARTRATE

Kalii hydrogenotartras

C₄H₅KO₆

M_r 188.2

DEFINITION

Potassium hydrogen (2*R*,3*R*)-2,3-dihydroxybutane-1,4-dioate.

Content: 99.5 per cent to 100.5 per cent (dried substance).

01/2005:0840

POTASSIUM HYDROXIDE

Kalii hydroxidum

KOH

 M_r 56.11

DEFINITION

Potassium hydroxide contains not less than 85.0 per cent and not more than the equivalent of 100.5 per cent of total alkali, calculated as KOH.

CHARACTERS

White, crystalline, hard masses, supplied as sticks, pellets or irregularly shaped pieces, deliquescent in air, hygroscopic, absorbing carbon dioxide, very soluble in water, freely soluble in alcohol.

IDENTIFICATION

- A. Dissolve 0.1 g in 10 ml of *water R* (this solution is used for identification test B). Dilute 1 ml of the solution to 100 ml with *water R*. The pH (2.2.3) of this solution is not less than 10.5.
- B. 1 ml of the initial solution prepared in identification test A gives reaction (b) of potassium (2.3.1).

TESTS

Solution S1. Dissolve 2.5 g in 10 ml of *water R*. Carefully add 2 ml of *nitric acid R*, with cooling, and dilute to 25 ml with *dilute nitric acid R*.

Solution S2. Dissolve 10 g in 15 ml of *distilled water R*. Carefully add 12 ml of *hydrochloric acid R*, with cooling, and dilute to 50 ml with *dilute hydrochloric acid R*.

Appearance of solution. Dissolve 5 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Carbonates. Not more than 2.0 per cent, calculated as K_2CO_3 , as determined in the assay.

Chlorides (2.4.4). Dilute 10 ml of solution S1 to 15 ml with *water R*. The solution complies with the limit test for chlorides (50 ppm).

Phosphates (2.4.11). Dilute 5 ml of solution S1 to 100 ml with *water R*. The solution complies with the limit test for phosphates (20 ppm).

Sulphates (2.4.13). 15 ml of solution S2 complies with the limit test for sulphates (50 ppm).

Aluminium (2.4.17). If intended for use in the manufacture of haemodialysis solutions, it complies with the test for aluminium. Dissolve 20 g in 100 ml of *water R* and add 10 ml of *acetate buffer solution pH 6.0 R*. The solution complies with the limit test for aluminium (0.2 ppm). Use as the reference solution a mixture of 2 ml of *aluminium standard solution (2 ppm Al) R*, 10 ml of *acetate buffer solution pH 6.0 R* and 98 ml of *water R*. To prepare the blank use a mixture of 10 ml of *acetate buffer solution pH 6.0 R* and 100 ml of *water R*.

Iron (2.4.9). Dilute 5 ml of solution S2 to 10 ml with *water R*. The solution complies with the limit test for iron (10 ppm).

Sodium. Not more than 1.0 per cent of Na, determined by atomic absorption spectrometry (2.2.23, *Method II*).

Test solution. Dissolve 1.00 g in 50 ml of *water R*, add 5 ml of *sulphuric acid R* and dilute to 100.0 ml with *water R*. Dilute 1.0 ml of the solution to 10.0 ml with *water R*.

Reference solutions. Prepare the reference solutions using *sodium standard solution (200 ppm Na) R*, diluted as necessary with *water R*.

Measure the absorbance at 589 nm using a sodium hollow-cathode lamp as a source of radiation and an air-acetylene flame.

Heavy metals (2.4.8). Dilute 10 ml of solution S2 to 20 ml with *water R*. 12 ml of the solution complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

ASSAY

Dissolve 2.000 g in 25 ml of *carbon-dioxide free water R*. Add 25 ml of freshly prepared *barium chloride solution R1* and 0.3 ml of *phenolphthalein solution R*. Add slowly with shaking 25.0 ml of *1 M hydrochloric acid* and continue the titration with *1 M hydrochloric acid* until the colour changes from pink to colourless. Add 0.3 ml of *bromophenol blue solution R* and continue the titration with *1 M hydrochloric acid* until the colour changes from violet-blue to yellow.

1 ml of *1 M hydrochloric acid* used in the second part of the titration is equivalent to 69.11 mg of K_2CO_3 .

1 ml of *1 M hydrochloric acid* used in the combined titrations is equivalent to 56.11 mg of total alkali, calculated as KOH.

STORAGE

Store in an airtight, non-metallic container.

LABELLING

The label states, where applicable, that the substance is suitable for use in the manufacture of haemodialysis solutions.

01/2005:0186

POTASSIUM IODIDE

Kalii iodidum

KI

166.0

DEFINITION

Potassium iodide contains not less than 99.0 per cent and not more than the equivalent of 100.5 per cent of KI, calculated with reference to the dried substance.

CHARACTERS

A white powder or colourless crystals, very soluble in water, freely soluble in glycerol, soluble in alcohol.

IDENTIFICATION

- A. Solution S (see Tests) gives the reactions of iodides (2.3.1).
- B. Solution S gives the reactions of potassium (2.3.1).

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Alkalinity. To 12.5 ml of solution S add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.5 ml of *0.01 M hydrochloric acid* is required to change the colour of the indicator.

Iodates. To 10 ml of solution S add 0.25 ml of *iodide-free starch solution R* and 0.2 ml of *dilute sulphuric acid R* and allow to stand protected from light for 2 min. No blue colour develops.

Sulphates (2.4.13). 10 ml of solution S diluted to 15 ml with *distilled water R* complies with the limit test for sulphates (150 ppm).

Thiosulphates. To 10 ml of solution S add 0.1 ml of *starch solution R* and 0.1 ml of 0.005 M *iodine*. A blue colour is produced.

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Iron (2.4.9). 5 ml of solution S diluted to 10 ml with *water R* complies with the limit test for iron (20 ppm).

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.00 g of previously powdered substance by drying in an oven at 100-105 °C for 3 h.

ASSAY

Dissolve 1.500 g in *water R* and dilute to 100.0 ml with the same solvent. To 20.0 ml of the solution add 40 ml of *hydrochloric acid R* and titrate with 0.05 M *potassium iodate* until the colour changes from red to yellow. Add 5 ml of *chloroform R* and continue the titration, shaking vigorously, until the chloroform layer is decolourised. 1 ml of 0.05 M *potassium iodate* is equivalent to 16.60 mg of KI.

STORAGE

Store protected from light.

01/2005:2075

POTASSIUM METABISULPHITE

Kalii metabisulfis

K₂S₂O₅

*M*_r 222.3

DEFINITION

Potassium metabisulphite (potassium disulphite).

Content: 95.0 per cent to 101.0 per cent.

CHARACTERS

Appearance: white powder or colourless crystals.

Solubility: freely soluble in water, slightly soluble in alcohol.

IDENTIFICATION

- It complies with the test for pH (see Tests).
- To 5 ml of solution S (see Tests), add 0.5 ml of 0.05 M *iodine*. The mixture is colourless and gives reaction (a) of sulphates (2.3.1).
- Solution S gives reaction (a) of potassium (2.3.1).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method I*).

pH (2.2.3): 3.0 to 4.5 for solution S.

Thiosulphates. To 2.00 g add 25 ml of a 42.5 g/l solution of *sodium hydroxide R* and 75 ml of *water R*. Shake until dissolved and add 10 ml of *formaldehyde R* and 10 ml of

acetic acid R. After 5 min, titrate with 0.03 M *iodine* using 1 ml of *starch solution R*. Carry out a blank titration. The difference between the volumes consumed in the 2 titrations is maximum 0.15 ml.

Iron: maximum 10 ppm.

Atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dilute 20 ml of solution S to 50 ml with *water R*.

Reference solutions. Prepare the reference solutions using *iron standard solution (20 ppm Fe) R*, diluted as necessary with *water R*.

Source: iron hollow-cathode lamp.

Wavelength: 248.3 nm.

Atomisation device: air-acetylene flame.

Selenium: maximum 10 ppm.

To 3.0 g add 10 ml of *formaldehyde R*. Carefully add 2 ml of *hydrochloric acid R* in small portions. Heat on a water-bath for 20 min. Any pink colour in the solution is not more intense than that of a reference solution prepared at the same time in the same manner using 1.0 g of the substance to be examined to which 0.2 ml of *selenium standard solution (100 ppm Se) R* has been added.

Zinc: maximum 25 ppm.

Atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dilute 20 ml of solution S to 50 ml with *water R*.

Reference solutions. Prepare the reference solutions using *zinc standard solution (100 ppm Zn) R*, diluted as necessary with *water R*.

Source: zinc hollow-cathode lamp.

Wavelength: 213.9 nm.

Atomisation device: air-acetylene flame.

Heavy metals (2.4.8): maximum 10 ppm.

Introduce 40 ml of solution S into a silica crucible, add 10 ml of *hydrochloric acid R* and evaporate to dryness. Dissolve the residue in 19 ml of *water R* and add 1 ml of a 40 g/l solution of *sodium fluoride R*. The solution complies with limit test E. Prepare the standard using 20 ml of *lead standard solution (1 ppm Pb) R*.

ASSAY

In a 500 ml conical flask containing 50.0 ml of 0.05 M *iodine* introduce 0.150 g and add 5 ml of *hydrochloric acid R*. Titrate the excess of iodine with 0.1 M *sodium thiosulphate* using 0.1 ml of *starch solution R*.

1 ml of 0.05 M *iodine* is equivalent to 5.558 mg of K₂S₂O₅.

STORAGE

In an airtight container, protected from light.

01/2005:1465

POTASSIUM NITRATE

Kalii nitras

KNO₃

*M*_r 101.1

DEFINITION

Potassium nitrate contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of KNO₃, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder or colourless crystals, freely soluble in water, very soluble in boiling water, practically insoluble in alcohol.

IDENTIFICATION

- A. It gives the reaction of nitrates (2.3.1).
B. Solution S (see Tests) gives the reactions of potassium (2.3.1).

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.05 ml of *bromothymol blue solution R1*. Not more than 0.5 ml of 0.01 M *hydrochloric acid* or 0.01 M *sodium hydroxide* is required to change the colour of the indicator.

Reducible substances. To 10 ml of solution S, add 0.5 ml of *dilute sulphuric acid R* and 2 ml of *zinc iodide and starch solution R*. The solution does not become blue within 2 min.

Chlorides (2.4.4). If intended for ophthalmic use, it complies with the test for chlorides. Dissolve 2.5 g in *water R* and dilute to 15 ml with the same solvent. The solution complies with the limit test for chlorides (20 ppm).

Sulphates (2.4.13). Dilute 10 ml of solution S to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (150 ppm).

Ammonium (2.4.1). 1 ml of solution S complies with the limit test (A) for ammonium (100 ppm). If intended for ophthalmic use, not more than 50 ppm of ammonium.

Calcium (2.4.3). Dilute 10 ml of solution S to 15 ml with *distilled water R*. The solution complies with the limit test for calcium (100 ppm). If intended for ophthalmic use, not more than 50 ppm of calcium.

Iron (2.4.9). Dilute 5 ml of solution S to 10 ml with *water R*. The solution complies with the limit test for iron (20 ppm). If intended for ophthalmic use, not more than 10 ppm of iron.

Sodium. Not more than 0.1 per cent of Na, determined by atomic emission spectrometry (2.2.22, *Method II*).

Test solution. Dissolve 1.00 g in *water R* and dilute to 100.0 ml with the same solvent.

Reference solutions. Prepare the reference solutions using *sodium standard solution* (200 ppm Na) *R*, diluted as necessary with *water R*.

Measure the emission intensity at 589 nm.

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution* (1 ppm Pb) *R*.

Loss on drying (2.2.32). Not more than 0.5 per cent determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

ASSAY

Prepare a chromatography column 0.3 m long and 10 mm in internal diameter and filled with 10 g of *strongly acidic cation-exchange resin R* covered with *carbon dioxide-free water R*. Maintain a 1 cm layer of liquid above the resin at all times. Allow 100 ml of *dilute hydrochloric acid R* to run through the column at a flow rate of about 5 ml/min. Wash the column (with the tap completely open) with *carbon dioxide-free water R* until neutral to *blue litmus paper R*. Dissolve 0.200 g of the substance to be examined in 2 ml

of *carbon dioxide-free water R* in a beaker and transfer it to the column reservoir, allow the solution to run through the column at a flow rate of about 3 ml/min and collect the eluate. Wash the beaker with 10 ml of *carbon dioxide-free water R* and transfer this solution at the same flow rate to the column before it runs dry. Finally wash the column with 200 ml of *carbon dioxide-free water R* (with the tap completely open) until neutral to *blue litmus paper R*. Titrate the combined eluate and washings with 0.1 M *sodium hydroxide*, using 1 ml of *phenolphthalein solution R* as indicator.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 10.11 mg of KNO₃.

LABELLING

The label states, where applicable, that the substance is suitable for ophthalmic use.

01/2005:1987

POTASSIUM PERCHLORATE

Kalii perchloras

KClO₄ *M_r* 138.6

DEFINITION

Content: 99.0 per cent to 102.0 per cent.

CHARACTERS

Appearance: white, crystalline powder or colourless crystals.
Solubility: sparingly soluble in water, practically insoluble in alcohol.

IDENTIFICATION

- A. Dissolve 0.1 g in 5 ml of *water R*. Add 5 ml of *indigo carmine solution R* and heat to boiling. The colour of the solution does not disappear.
B. It complies with the test for chlorates and chlorides (see Tests).
C. Heat 10 mg over a flame for 2 min. Dissolve the residue in 2 ml of *water R*. The solution gives reaction (a) of chlorides (2.3.1).
D. Dissolve 50 mg with heating in 5 ml of *water R*. Allow to cool to room temperature. The solution gives reaction (a) of potassium (2.3.1).

TESTS

Solution S. Suspend 5.0 g in 90 ml of *distilled water R* and heat to boiling. Allow to cool. Filter. Dilute the filtrate to 100 ml with *carbon dioxide-free water R*.

Appearance of solution. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Dissolve 0.20 g in *water R* and dilute to 20 ml with the same solvent.

Acidity or alkalinity. To 5 ml of solution S add 5 ml of *water R* and 0.1 ml of *phenolphthalein solution R*. Not more than 0.25 ml of 0.01 M *sodium hydroxide* is required to change the colour of the indicator. To 5 ml of solution S, add 5 ml of *water R* and 0.1 ml of *bromocresol green solution R*. Not more than 0.25 ml of 0.01 M *hydrochloric acid* is required to change the colour of the indicator.

Chlorates and chlorides (2.4.4): maximum 100 ppm (calculated as chlorides).

To 5 ml of solution S, add 5 ml of *water R* and heat to boiling. Add 1 ml of *nitric acid R* and 0.1 g of *sodium nitrite R*. Allow to cool to room temperature. Dilute to 15 ml

with *water R*. The solution complies with the limit test for chlorides. Prepare the standard using 5 ml of *chloride standard solution (5 ppm Cl) R* and 10 ml of *water R*, and adding only 1 ml of *dilute nitric acid R*.

Sulphates (2.4.13): maximum 100 ppm.

15 ml of solution S complies with the limit test for sulphates. Prepare the standard using a mixture of 7.5 ml of *sulphate standard solution (10 ppm SO₄) R* and 7.5 ml of *water R*.

Calcium (2.4.3): maximum 100 ppm.

15 ml of solution S complies with the limit test for calcium. Prepare the standard using a mixture of 7.5 ml of *calcium standard solution (10 ppm Ca) R*, 1 ml of *dilute acetic acid R* and 7.5 ml of *distilled water R*.

Heavy metals (2.4.8): maximum 20 ppm.

12 ml of solution S complies with limit test A. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

ASSAY

Prepare a chromatography column 0.3 m long and 10 mm in internal diameter and filled with 10 g of *strongly acidic ion-exchange resin R* covered with *carbon dioxide-free water R*. Maintain a 1 cm layer of liquid above the resin throughout the determination. Allow 100 ml of *dilute hydrochloric acid R* to run through the column at a flow rate of about 5 ml/min. Wash the column (with the tap completely open) with *carbon dioxide-free water R* until the eluate is neutral to *blue litmus paper R*. Dissolve 0.100 g of the substance to be examined in 10 ml of *carbon dioxide-free water R* in a beaker and transfer it to the column reservoir, allow the solution to run through the column at a flow rate of about 3 ml/min and collect the eluate. Wash the beaker 3 times with 10 ml of *carbon dioxide-free water R* and transfer this solution at the same flow rate to the column before it runs dry. Finally, wash the column with 200 ml of *carbon dioxide-free water R* (with the tap completely open) until the eluate is neutral to *blue litmus paper R*. Titrate the combined eluate and washings with 0.1 M *sodium hydroxide*, using 1 ml of *phenolphthalein solution R* as indicator.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 13.86 mg of KClO₄.

01/2005:0121

POTASSIUM PERMANGANATE

Kalii permanganas

KMnO₄

M_r 158.0

DEFINITION

Potassium permanganate contains not less than 99.0 per cent and not more than the equivalent of 100.5 per cent of KMnO₄.

CHARACTERS

A dark purple or brownish-black, granular powder or dark purple or almost black crystals, usually having a metallic lustre, soluble in cold water, freely soluble in boiling water. It decomposes on contact with certain organic substances.

IDENTIFICATION

- Dissolve about 50 mg in 5 ml of *water R* and add 1 ml of *alcohol R* and 0.3 ml of *dilute sodium hydroxide solution R*. A green colour develops. Heat to boiling. A dark brown precipitate is formed.
- Filter the mixture obtained in identification test A. The filtrate gives reaction (b) of potassium (2.3.1).

TESTS

Solution S. Dissolve 0.75 g in 25 ml of *distilled water R*, add 3 ml of *alcohol R* and boil for 2 min to 3 min. Cool, dilute to 30 ml with *distilled water R* and filter.

Appearance of solution. Solution S is colourless (2.2.2, *Method II*).

Substances insoluble in water. Dissolve 0.5 g in 50 ml of *water R* and heat to boiling. Filter through a tared sintered-glass filter (16). Wash with *water R* until the filtrate is colourless and collect the residue on the filter. The residue, dried in an oven at 100 °C to 105 °C, weighs not more than 5 mg (1.0 per cent).

Chlorides (2.4.4). 10 ml of solution S diluted to 15 ml with *water R* complies with the limit test for chlorides (200 ppm).

Sulphates (2.4.13). 12 ml of solution S diluted to 15 ml with *distilled water R* complies with the limit test for sulphates (500 ppm).

ASSAY

Dissolve 0.300 g in *water R* and dilute to 100.0 ml with the same solvent. To 20.0 ml of the solution add 20 ml of *water R*, 1 g of *potassium iodide R* and 10 ml of *dilute hydrochloric acid R*. Titrate the liberated iodine with 0.1 M *sodium thiosulphate*, using 1 ml of *starch solution R* as indicator.

1 ml of 0.1 M *sodium thiosulphate* is equivalent to 3.160 mg of KMnO₄.

01/2005:1986

POTASSIUM SODIUM TARTRATE TETRAHYDRATE

Kalii natrii tartras tetrahydricus

C₄H₄KNaO₆·4H₂O

M_r 282.2

DEFINITION

Potassium sodium (+)-(2*R*,3*R*)-2,3-dihydroxybutanedioate tetrahydrate.

Content: 98.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white, crystalline powder or colourless, transparent crystals.

Solubility: very soluble in water, practically insoluble in alcohol.

IDENTIFICATION

- It complies with the test for specific optical rotation (see Tests).
- It gives reaction (b) of tartrates (2.3.1).
- It gives reaction (b) of potassium (2.3.1).
- It gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 5.000 g in *carbon dioxide-free water R*, prepared from *distilled water R*, and dilute to 100.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 5 ml of solution S, add 0.1 ml of *phenolphthalein solution R*. Not more than 0.5 ml of 0.01 M *hydrochloric acid* or 0.01 M *sodium hydroxide* is required to change the colour of the indicator.

Specific optical rotation (2.2.7): + 28.0 to + 30.0 (anhydrous substance), determined on solution S.

Chlorides (2.4.4): maximum 100 ppm.

Dilute 10 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides.

Sulphates (2.4.13): maximum 50 ppm.

Dissolve 1.0 g in *distilled water R* and dilute to 15 ml with the same solvent. The solution complies with the limit test for sulphates. Prepare the reference solution with a mixture of 5 ml of *sulphate standard solution (10 ppm SO₄) R* and 10 ml of *distilled water R*.

Ammonium (2.4.1): maximum 40 ppm.

5 ml of solution S complies with the limit test for ammonium.

Barium and oxalates. To 5 ml of solution S, add 3 ml of *calcium sulphate solution R*. Allow to stand for 5 min. Any opalescence in the solution is not more intense than that in a mixture of 3 ml of *calcium sulphate solution R* and 5 ml of *distilled water R*.

Calcium (2.4.3): maximum 200 ppm.

Dilute 10 ml of solution S to 15 ml with *distilled water R*. The solution complies with the limit test for calcium.

Heavy metals (2.4.8): maximum 10 ppm.

Dissolve 2.0 g in *water R* and dilute to 20 ml with the same solvent. 12 ml of the solution complies with limit test A. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Water (2.5.12): 24.0 per cent to 26.5 per cent, determined on 50.0 mg. Use 50 ml of *anhydrous methanol R*. Titrate slowly.

ASSAY

To 0.100 g of finely powdered substance add 40 ml of *anhydrous acetic acid R* and 20 ml of *acetic anhydride R*. Titrate slowly with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 10.51 mg of C₆H₇KNaO₆.

01/2005:0618

POTASSIUM SORBATE

Kalii sorbas

C₆H₇KO₂

M_r 150.2

DEFINITION

Potassium sorbate contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of potassium (*E,E*)-hexa-2,4-dienoate, calculated with reference to the dried substance.

CHARACTERS

White or almost white powder or granules, very soluble in water, slightly soluble in alcohol.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

- Dissolve 50.0 mg in *water R* and dilute to 250.0 ml with the same solvent. Dilute 2.0 ml of this solution to 200.0 ml with 0.1 M *hydrochloric acid*. Examined between 230 nm and 350 nm (2.2.25), the solution shows a maximum at 264 nm. The specific absorbance at the maximum is 1650 to 1900.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *potassium sorbate CRS*.
- Dissolve 1.0 g in 50 ml of *water R*, add 10 ml of *dilute hydrochloric acid R* and shake. Filter the crystalline precipitate, wash with *water R* and dry in a vacuum over *sulphuric acid R* for 4 h. The residue obtained melts (2.2.14) at 132 °C to 136 °C.
- Dissolve 0.2 g in 2 ml of *water R* and add 2 ml of *dilute acetic acid R*. Filter. The solution gives reaction (b) of potassium (2.3.1).

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₅ (2.2.2, *Method II*).

Acidity or alkalinity. To 20 ml of solution S add 0.1 ml of *phenolphthalein solution R*. Not more than 0.25 ml of 0.1 M *sodium hydroxide* or 0.1 M *hydrochloric acid* is required to change the colour of the indicator.

Aldehydes. Dissolve 1.0 g in a mixture of 30 ml of *water R* and 50 ml of 2-propanol *R*, adjust the solution to pH 4 with 1 M *hydrochloric acid* and dilute to 100 ml with *water R*. To 10 ml of the solution add 1 ml of *decolorised fuchsin solution R* and allow to stand for 30 min. Any colour in the solution is not more intense than that in a standard prepared at the same time by adding 1 ml of *decolorised fuchsin solution R* to a mixture of 1.5 ml of *acetaldehyde standard solution (100 ppm C₂H₄O) R*, 4 ml of 2-propanol *R* and 4.5 ml of *water R* (0.15 per cent, calculated as C₂H₄O).

Heavy metals (2.4.8). 2.0 g complies with limit test D for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C for 3 h.

ASSAY

Dissolve 0.120 g in 20 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid* using 0.1 ml of *crystal violet solution R* as indicator until the colour changes from violet to bluish-green.

1 ml of 0.1 M *perchloric acid* is equivalent to 15.02 mg of C₆H₇KO₂.

STORAGE

Store protected from light.

01/2005:1622 ASSAY

POTASSIUM SULPHATE**Kalii sulfas** K_2SO_4 M_r 174.3**DEFINITION**

Content: 98.5 per cent to 101.0 per cent of K_2SO_4 (dried substance).

CHARACTERS

Appearance: white, crystalline powder or colourless crystals.

Solubility: soluble in water, practically insoluble in ethanol.

IDENTIFICATION

A. It gives the reactions of sulphates (2.3.1).

B. It gives the reactions of potassium (2.3.1).

TESTS

Solution S. Dissolve 10.0 g in 90 ml of *carbon dioxide-free water R* prepared from *distilled water R*, heating gently. Allow to cool and dilute to 100 ml with *carbon dioxide-free water R* prepared from *distilled water R*.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.5 ml of 0.01 M *hydrochloric acid* or 0.01 M *sodium hydroxide* is required to change the colour of the indicator.

Chlorides (2.4.4): maximum 40 ppm.

Dilute 12.5 ml of solution S to 15 ml with *water R*.

Calcium (2.4.3): maximum 200 ppm.

Dilute 5 ml of solution S to 15 ml with *distilled water R*.

Iron (2.4.9): maximum 10 ppm, determined on 10 ml of solution S.

Magnesium: maximum 20 ppm.

To 5 ml of solution S add 5 ml of *water R*, 1 ml of *glycerol* (85 per cent) *R*, 0.15 ml of *titan yellow solution R*, 0.25 ml of *ammonium oxalate solution R* and 5 ml of *dilute sodium hydroxide solution R* and shake. Any pink colour in the test solution is not more intense than that in a standard prepared at the same time and in the same manner using a mixture of 1 ml of *magnesium standard solution* (10 ppm Mg) *R* and 9 ml of *water R*.

Sodium: maximum 0.10 per cent.

Atomic emission spectrometry (2.2.22, *Method I*).

Test solution. Dissolve 1.00 g of the substance to be examined in *water R* and dilute to 100.0 ml with the same solvent.

Reference solutions. Dissolve in *water R* 0.50 g of *sodium chloride R*, previously dried at 100–105 °C for 3 h, and dilute to 1000.0 ml with the same solvent (200 µg of Na per millilitre). Dilute as required.

Wavelength: 589 nm.

Heavy metals (2.4.8): maximum 20 ppm.

12 ml of solution S complies with limit test A. Prepare the standard using *lead standard solution* (2 ppm Pb) *R*.

Loss on drying (2.2.32): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 130 °C for 4 h.

Dissolve 0.150 g in 40 ml of *water R*. Add 0.2 ml of 0.1 M *hydrochloric acid* and 80 ml of *methanol R*. Carry out a potentiometric titration (2.2.20), using 0.1 M *lead nitrate* and as indicator electrode a lead-selective electrode and as reference electrode a silver-silver chloride electrode.

1 ml of 0.1 M *lead nitrate* is equivalent to 17.43 mg of K_2SO_4 .

01/2005:0355

POTATO STARCH**Solani amyllum****DEFINITION**

Potato starch is obtained from the tuber of *Solanum tuberosum* L.

CHARACTERS

Appearance: very fine, white powder which creaks when pressed between the fingers.

Solubility: practically insoluble in cold water and in alcohol.

Potato starch does not contain starch grains of any other origin. It may contain a minute quantity, if any, of tissue fragments of the original plant.

IDENTIFICATION

- Examined under a microscope using a mixture of equal volumes of *glycerol R* and *water R*, it presents granules, either irregularly shaped, ovoid or pear-shaped, usually 30 µm to 100 µm in size but occasionally exceeding 100 µm, or rounded, 10 µm to 35 µm in size. There are occasional compound granules having 2 to 4 components. The ovoid and pear-shaped granules have an eccentric hilum and the rounded granules acentric or slightly eccentric hilum. All granules show clearly visible concentric striations. Between crossed nicol prisms, the granules show a distinct black cross intersecting at the hilum.
- Suspend 1 g in 50 ml of *water R*, boil for 1 min and cool. A thick, opalescent mucilage is formed.
- To 1 ml of the mucilage obtained in identification test B, add 0.05 ml of *iodine solution R1*. An orange-red to dark blue colour is produced which disappears on heating.

TESTS

pH (2.2.3): 5.0 to 8.0.

Shake 5.0 g with 25.0 ml of *carbon dioxide-free water R* for 60 s. Allow to stand for 15 min.

Foreign matter. Examined under a microscope using a mixture of equal volumes of *glycerol R* and *water R*, not more than traces of matter other than starch granules are present. No starch grains of any other origin are present.

Oxidising substances (2.5.30): maximum 20 ppm, calculated as H_2O_2 .

Sulphur dioxide (2.5.29): maximum 50 ppm.

Iron (2.4.9): maximum 10 ppm.

Shake 1.5 g with 15 ml of *dilute hydrochloric acid R*. Filter. The filtrate complies with the limit test for iron.

Loss on drying (2.2.32): maximum 20.0 per cent, determined on 1.000 g by drying in an oven at 130 °C for 90 min.

Sulphated ash (2.4.14): maximum 0.6 per cent, determined on 1.0 g.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10^3 bacteria and not more than 10^2 fungi per gram, determined by plate count. It complies with the test for *Escherichia coli* (2.6.13).

D. To 0.1 ml of solution S1 add 5 ml of *water R* and 0.2 ml of 0.05 M iodine. A red colour is produced.

E. It is freely soluble in *water R*.

01/2005:0685
corrected

POVIDONE

Povidonum

DEFINITION

α -Hydro- ω -hydropoly[1-(2-oxopyrrolidin-1-yl)ethylene]. It consists of linear polymers of 1-ethenylpyrrolidin-2-one.

Content: 11.5 per cent to 12.8 per cent of nitrogen (N; A_r 14.01) (anhydrous substance).

The different types of povidone are characterised by their viscosity in solution, expressed as a *K*-value.

The *K*-value of povidone having a stated *K*-value of 15 or less is 85.0 per cent to 115.0 per cent of the stated value.

The *K*-value of povidone having a stated *K*-value or a stated *K*-value range with an average of more than 15 is 90.0 per cent to 108.0 per cent of the stated value or of the average of the stated range.

CHARACTERS

Appearance: white or yellowish-white powder or flakes, hygroscopic.

Solubility: freely soluble in water, in alcohol and in methanol, slightly soluble in acetone.

IDENTIFICATION

First identification: A, E.

Second identification: B, C, D, E.

A. Infrared absorption spectrophotometry (2.2.24).

Preparation: dry the substances previously at 105 °C for 6 h. Record the spectra using 4 mg of substance.

Comparison: povidone CRS.

B. To 0.4 ml of solution S1 (see Tests) add 10 ml of *water R*, 5 ml of *dilute hydrochloric acid R* and 2 ml of *potassium dichromate solution R*. An orange-yellow precipitate is formed.

C. To 1 ml of solution S1 add 0.2 ml of *dimethylaminobenzaldehyde solution R1* and 0.1 ml of *sulphuric acid R*. A pink colour is produced.

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent. Add the substance to be examined to the water in small portions with magnetic stirring.

Solution S1. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent. Add the substance to be examined to the water in small portions with magnetic stirring.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution B₆, BY₆ or R₆ (2.2.2, *Method II*).

pH (2.2.3): 3.0 to 5.0 for solution S, for povidone having a stated *K*-value of at most 30; 4.0 to 7.0 for solution S, for povidone having a stated *K*-value of more than 30.

Viscosity, expressed as *K*-value. For povidone having a stated value of 18 or less, use a 50 g/l solution. For povidone having a declared value of more than 18, use a 10 g/l solution. For povidone having a declared value of more than 95, use a 1.0 g/l solution. Allow to stand for 1 h and determine the viscosity (2.2.9) of the solution at 25 °C, using viscometer No.1 with a minimum flow time of 100 s. Calculate the *K*-value from the expression:

$$\frac{1.5 \log \eta - 1}{0.15 + 0.003c} + \frac{\sqrt{300c \log \eta + (c + 1.5c \log \eta)^2}}{0.15c + 0.003c^2}$$

c = concentration of the substance to be examined, calculated with reference to the anhydrous substance, in grams per 100 ml,

η = viscosity of the solution relative to that of *water R*.

Aldehydes: maximum 500 ppm, expressed as acetaldehyde.

Test solution. Dissolve 1.0 g of the substance to be examined in *phosphate buffer solution pH 9.0 R* and dilute to 100.0 ml with the same solvent. Stopper the flask and heat at 60 °C for 1 h. Allow to cool.

Reference solution. Dissolve 0.140 g of *acetaldehyde ammonia trimer trihydrate R* in *water R* and dilute to 200.0 ml with the same solvent. Dilute 1.0 ml of this solution to 100.0 ml with *phosphate buffer solution pH 9.0 R*.

Into 3 identical spectrophotometric cells with a path length of 1 cm, introduce separately 0.5 ml of the test solution, 0.5 ml of the reference solution and 0.5 ml of *water R* (blank). To each cell, add 2.5 ml of *phosphate buffer solution pH 9.0 R* and 0.2 ml of *nicotinamide-adenine dinucleotide solution R*. Mix and stopper tightly. Allow to stand at 22 ± 2 °C for 2-3 min and measure the absorbance (2.2.25) of each solution at 340 nm, using *water R* as the compensation liquid. To each cell, add 0.05 ml of *aldehyde dehydrogenase solution R*, mix and stopper tightly. Allow to stand at 22 ± 2 °C for 5 min. Measure the absorbance of each solution at 340 nm using *water R* as the compensation liquid.

Determine the content of aldehydes using the expression:

$$\frac{(A_{t2} - A_{t1}) - (A_{b2} - A_{b1})}{(A_{s2} - A_{s1}) - (A_{b2} - A_{b1})} \times \frac{100\,000 \times C}{m}$$

- A_{t1} = absorbance of the test solution before the addition of aldehyde dehydrogenase,
 A_{t2} = absorbance of the test solution after the addition of aldehyde dehydrogenase,
 A_{s1} = absorbance of the reference solution before the addition of aldehyde dehydrogenase,
 A_{s2} = absorbance of the reference solution after the addition of aldehyde dehydrogenase,
 A_{b1} = absorbance of the blank before the addition of aldehyde dehydrogenase,
 A_{b2} = absorbance of the blank after the addition of aldehyde dehydrogenase,
 m = mass of povidone calculated with reference to the anhydrous substance, in grams,
 C = concentration of acetaldehyde in the reference solution, calculated from the weight of the acetaldehyde ammonia trimer trihydrate with the factor 0.72, in milligrams per millilitre.

Peroxides: maximum 400 ppm, expressed as H_2O_2 .

Dissolve 2.0 g in 50 ml of *water R*. To 25 ml of this solution, add 2 ml of *titanium trichloride-sulphuric acid reagent R*. Allow to stand for 30 min. The absorbance (2.2.25) of the solution, measured at 405 nm using a mixture of 25 ml of a 40 g/l solution of the substance to be examined and 2 ml of a 13 per cent V/V solution of *sulphuric acid R* as the compensation liquid, is not greater than 0.35.

Hydrazine. Thin-layer chromatography (2.2.27). Use freshly prepared solutions.

Test solution. Dissolve 2.5 g of the substance to be examined in 25 ml of *water R*. Add 0.5 ml of a 50 g/l solution of *salicylaldehyde R* in *methanol R*, mix and heat in a water-bath at 60 °C for 15 min. Allow to cool, add 2.0 ml of *toluene R*, shake for 2 min and centrifuge. Use the clear supernatant layer.

Reference solution. Dissolve 9 mg of *salicylaldehydeazine R* in *toluene R* and dilute to 100 ml with the same solvent. Dilute 1 ml of the solution to 10 ml with *toluene R*.

Plate: TLC silanised silica gel plate *R*.

Mobile phase: *water R*, *methanol R* (1:2 V/V).

Application: 10 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: examine in ultraviolet light at 365 nm.

Limit:

- *hydrazine*: any spot corresponding to *salicylaldehydeazine* in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (1 ppm).

Impurity A. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.25 g of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 50 mg of *1-vinylpyrrolidin-2-one R* in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 100.0 ml with *methanol R*. Dilute 5.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 10 mg of *1-vinylpyrrolidin-2-one R* and 0.5 g of *vinyl acetate R* in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Precolumn:

- *size*: $l = 0.025$ m, $\varnothing = 4$ mm,
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm).

Column:

- *size*: $l = 0.25$ m, $\varnothing = 4$ mm,
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm),
- *temperature*: 40 °C.

Mobile phase: *acetonitrile R*, *water R* (10:90 V/V).

Flow rate: adjusted so that the retention time of the peak corresponding to impurity A is about 10 min.

Detection: spectrophotometer at 235 nm.

Injection: 50 µl. After injection of the test solution, wait for about 2 min and wash the precolumn by passing the mobile phase backward, at the same flow rate applied in the test, for 30 min.

System suitability:

- *resolution*: minimum 2.0 between the peaks due to impurity A and to vinyl acetate in the chromatogram obtained with reference solution (b),
- *repeatability*: maximum relative standard deviation of 2.0 per cent after 5 injections of reference solution (a).

Limit:

- *impurity A*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (10 ppm).

Impurity B. Liquid chromatography (2.2.29).

Test solution. Dissolve 100 mg of the substance to be examined in *water R* and dilute to 50.0 ml with the same solvent.

Reference solution. Dissolve 100 mg of *2-pyrrolidone R* in *water R* and dilute to 100 ml with the same solvent. Dilute 3.0 ml to 50.0 ml with *water R*.

Precolumn:

- *size*: $l = 0.025$ m, $\varnothing = 4$ mm,
- *stationary phase*: *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

Column:

- *size*: $l = 0.25$ m, $\varnothing = 4$ mm,
- *stationary phase*: *spherical aminohexadecylsilyl silica gel for chromatography R* (5 µm),
- *temperature*: 30 °C.

Mobile phase: *water R*, adjusted to pH 2.4 with *phosphoric acid R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 205 nm. A detector is placed between the precolumn and the analytical column. A second detector is placed after the analytical column.

Injection: 10 µl. When impurity B has left the precolumn (after about 1.2 min) switch the flow directly from the pump to the analytical column. Before the next chromatogram is run, wash the precolumn by reversed flow.

System suitability:

- *symmetry factor*: maximum 2.0 for the peak due to impurity B.

Limit:

- **impurity B:** not more than the area of the principal peak in the chromatogram obtained with the reference solution (3.0 per cent).

Heavy metals (2.4.8): maximum 10 ppm.

2.0 g complies with limit test D. Prepare the standard using 2.0 ml of *lead standard solution* (10 ppm Pb) R.

Water (2.5.12): maximum 5.0 per cent, determined on 0.500 g.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Place 100.0 mg of the substance to be examined (*m* mg) in a combustion flask, add 5 g of a mixture of 1 g of *copper sulphate R*, 1 g of *titanium dioxide R* and 33 g of *dipotassium sulphate R*, and 3 glass beads. Wash any adhering particles from the neck into the flask with a small quantity of *water R*. Add 7 ml of *sulphuric acid R*, allowing it to run down the sides of the flask, and mix the contents by rotation. Close the mouth of the flask loosely, for example by means of a glass bulb with a short stem, to avoid excessive loss of sulphuric acid. Heat gradually at first, then increase the temperature until there is vigorous boiling with condensation of sulphuric acid in the neck of the flask; precautions are to be taken to prevent the upper part of the flask from becoming overheated. Continue the heating for 45 min. Cool, dissolve the solid material by cautiously adding to the mixture 20 ml of *water R*, cool again and place in a steam-distillation apparatus. Add 30 ml of *strong sodium hydroxide solution R* through the funnel, rinse cautiously the funnel with 10 ml of *water R* and distil immediately by passing steam through the mixture. Collect about 80–100 ml of distillate in a mixture of 30 ml of a 40 g/l solution of *boric acid R* and 3 drops of *bromocresol green-methyl red solution R* and enough *water R* to cover the tip of the condenser. Towards the end of the distillation lower the receiver so that the tip of the condenser is above the surface of the acid solution and rinse the end part of the condenser with a small quantity of *water R*. Titrate the distillate with 0.025 M *sulphuric acid* until the colour of the solution changes from green through pale greyish-blue to pale greyish-red-purple (n_1 ml of 0.025 M *sulphuric acid*).

Repeat the test using about 100.0 mg of *glucose R* in place of the substance to be examined (n_2 ml of 0.025 M *sulphuric acid*).

$$\text{percentage content of nitrogen} = \frac{0.7004 (n_1 - n_2)}{m} \times 100$$

STORAGE

In an airtight container.

LABELLING

The label indicates the nominal *K*-value.

IMPURITIES

A. R = CH=CH₂: 1-ethenylpyrrolidin-2-one (1-vinylpyrrolidin-2-one),

B. R = H: pyrrolidin-2-one (2-pyrrolidone).

POVIDONE, IODINATED**Povidonum iodinatum****DEFINITION**

Complex of iodine and povidone.

Content: 9.0 per cent to 12.0 per cent of available iodine (dried substance).

PRODUCTION

It is produced using povidone that complies with the monograph on *Povidone* (0685), except that the povidone used may contain not more than 2.0 per cent of formic acid and not more than 8.0 per cent of water.

CHARACTERS

Appearance: yellowish-brown or reddish-brown, amorphous powder.

Solubility: soluble in water and in ethanol (96 per cent), practically insoluble in acetone.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: iodinated povidone CRS.

B. Dissolve 10 mg in 10 ml of *water R* and add 1 ml of *starch solution R*. An intense blue colour is produced.

C. Dissolve 0.1 g in 5 ml of *water R* and add a 10 g/l solution of *sodium sulphite R* dropwise, until the solution becomes colourless. Add 2 ml of *potassium dichromate solution R* and 1 ml of *hydrochloric acid R*. A light brown precipitate is formed.

TESTS

pH (2.2.3): 1.5 to 5.0.

Dissolve 1.0 g in 10 ml of *carbon dioxide-free water R*.

Iodide: maximum 6.0 per cent (dried substance).

Dissolve 0.500 g in 100 ml of *water R*. Add *sodium metabisulphite R* until the colour of the iodine has disappeared. Add 25.0 ml of 0.1 M *silver nitrate*, 10 ml of *nitric acid R* and 5 ml of *ferric ammonium sulphate solution R2*. Titrate with 0.1 M *ammonium thiocyanate*. Carry out a blank titration.

1 ml of 0.1 M *silver nitrate* is equivalent to 12.69 mg of total iodine. From the percentage of total iodine, calculated with reference to the dried substance, subtract the percentage of available iodine as determined in the assay to obtain the percentage of iodide.

Loss on drying (2.2.32): maximum 8.0 per cent, determined on 0.500 g by drying in an oven at 100–105 °C for 3 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Transfer 1.000 g into a ground-glass-stoppered flask containing 150 ml of *water R* and stir for 1 h. Add 0.1 ml of *dilute acetic acid R* and titrate with 0.1 M *sodium thiosulphate* using *starch solution R* as indicator.

1 ml of 0.1 M *sodium thiosulphate* is equivalent to 12.69 mg of available iodine.

STORAGE

Protected from light.

01/2005:2059
corrected**PRAVASTATIN SODIUM**

Pravastatinum natricum

 $C_{23}H_{35}NaO_7$ M_r 446.5**DEFINITION**

Sodium (3*R*,5*R*)-3,5-dihydroxy-7-[(1*S*,2*S*,6*S*,8*S*,8*aR*)-6-hydroxy-2-methyl-8-[[[(2*S*)-2-methylbutanoyl]oxy]-1,2,6,7,8,8*a*-hexahydronaphthalen-1-yl]heptanoate.

Content: 97.0 per cent to 102.0 per cent (anhydrous and ethanol-free substance).

CHARACTERS

Appearance: white to yellowish white powder or crystalline powder, hygroscopic.

Solubility: freely soluble in water and in methanol, soluble in ethanol.

IDENTIFICATION

A. Specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of pravastatin sodium.

C. 1 ml of solution S (see Tests) gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 1.00 g in carbon dioxide free water *R* and dilute to 20.0 ml with the same solvent.

Appearance of solution. The solution is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, Method II).

Dilute 2.0 ml of solution S to 10.0 ml with water *R*.

pH (2.2.3): 7.2 to 9.0 for solution S.

Specific optical rotation (2.2.7): + 153 to + 159 (anhydrous and ethanol-free substance).

Dilute 2.0 ml of solution S to 20.0 ml with water *R*.

Related substances. Liquid chromatography (2.2.29).

Solvent mixture. Mix 9 volumes of methanol *R* with 11 volumes of water *R*.

Test solution (a). Dissolve 0.1000 g of the substance to be examined in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Test solution (b). Dilute 10.0 ml of test solution (a) to 100.0 ml with the solvent mixture.

Reference solution (a). Dissolve 5.0 mg of the substance to be examined and 5.0 mg of pravastatin impurity A CRS in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (b). Dilute 2.0 ml of test solution (a) to 100.0 ml with the solvent mixture. Dilute 1.0 ml to 10.0 ml with the solvent mixture.

Reference solution (c). Dissolve 12.4 mg of pravastatin 1,1,3,3-tetramethylbutylamine CRS in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Column:

- *size*: $l = 0.15$ m, $\varnothing = 4.6$ mm,
- *stationary phase*: octadecylsilyl silica gel for chromatography *R* (5 μ m),
- *temperature*: 25 °C.

Mobile phase: glacial acetic acid *R*, triethylamine *R*, methanol *R*, water *R* (1:1:450:550 V/V/V/V).

Flow rate: 1.3 ml/min.

Detection: spectrophotometer at 238 nm.

Injection: 10 μ l; inject test solution (a) and reference solutions (a) and (b).

Run time: 2.5 times the retention time of pravastatin.

Relative retention with reference to pravastatin (retention time = about 21 min): impurity B = about 0.2; impurity A = about 0.6; impurity C = about 2.1.

System suitability: reference solution (a):

- *resolution*: minimum 7.0 between the peaks due to impurity A and to pravastatin.

Limits:

- *impurity A*: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent),
- *any impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),
- *total*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.6 per cent),
- *disregard limit*: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Ethanol (2.4.24, System A): maximum 3.0 per cent *m/m*.

Heavy metals (2.4.8): maximum 20 ppm.

Dissolve 2.0 g of substance to be examined in a mixture of 15 volumes of water *R* and 85 volumes of methanol *R* and dilute to 20 ml with the same mixture of solvents. 12 ml of this solution complies with limit test B. Prepare the standard using lead standard solution (2 ppm Pb) prepared by diluting lead standard solution (100 ppm Pb) *R* with a mixture of 15 volumes of water *R* and 85 volumes of methanol *R*.

Water (2.5.12): maximum 4.0 per cent, determined on 0.500 g.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances.

Injection: test solution (b) and reference solution (c).

Calculate the percentage content of $C_{23}H_{35}NaO_7$ using the chromatogram obtained with reference solution (c) and the declared content of pravastatin in pravastatin 1,1,3,3-tetramethylbutylamine CRS.

1 mg of pravastatin is equivalent to 1.052 mg of pravastatin sodium.

STORAGE

In an airtight container.

IMPURITIES

01/2005:1466

- A. (3*R*,5*R*)-3,5-dihydroxy-7-[(1*S*,2*S*,6*R*,8*S*,8*aR*)-6-hydroxy-2-methyl-8-[(2*S*)-2-methylbutanoyl]oxy]-1,2,6,7,8,8*a*-hexahydronaphthalen-1-yl]heptanoic acid (6'-epipravastatin),

- B. (3*R*,5*R*)-3,5-dihydroxy-7-[(1*S*,2*S*,6*S*,8*S*,8*aR*)-6-hydroxy-8-[(2*S*,3*R*)-3-hydroxy-2-methylbutanoyl]oxy]-2-methyl-1,2,6,7,8,8*a*-hexahydronaphthalen-1-yl]heptanoic acid (3''-hydroxypravastatin),

- C. (3*R*,5*R*)-3,5-dihydroxy-7-[(1*S*,2*S*,6*S*,8*S*,8*aR*)-6-hydroxy-2-methyl-8-[(2*S*)-2-methylpentanoyl]oxy]-1,2,6,7,8,8*a*-hexahydronaphthalen-1-yl]heptanoic acid,

- D. (1*S*,3*S*,7*S*,8*S*,8*aR*)-3-hydroxy-8-[2-[(2*R*,4*R*)-4-hydroxy-6-oxotetrahydro-2*H*-pyran-2-yl]ethyl]-7-methyl-1,2,3,7,8,8*a*-hexahydronaphthalen-1-yl (2*S*)-2-methylbutanoate (pravastatin lactone).

PRAZEPAM

Prazepamum

 $C_{19}H_{17}ClN_2O$ M_r 324.8

DEFINITION

Prazepam contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 7-chloro-1-(cyclopropylmethyl)-5-phenyl-1,3-dihydro-2*H*-1,4-benzodiazepin-2-one, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, freely soluble in methylene chloride, sparingly soluble in ethanol.

It melts at about 145 °C.

IDENTIFICATION

First identification: B.

Second identification: A, C.

- A. Dissolve 30.0 mg in *alcohol R* and dilute to 100.0 ml with the same solvent. Dilute 20.0 ml of the solution to 100.0 ml (solution A) and 2.0 ml of the solution to 100.0 ml (solution B) with the same solvent. Examined between 300 nm and 350 nm (2.2.25), solution A shows an absorption maximum at 312 nm. Examined between 210 nm and 300 nm, solution B shows an absorption maximum at 228 nm and a point of inflexion at about 252 nm. The specific absorbance at the maximum at 228 nm is 900 to 940. The specific absorbance at the maximum at 312 nm is 59 to 63.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *prazepam CRS*.
- C. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, fluorescence at 365 nm and size to the principal spot in the chromatogram obtained with reference solution (b).

TESTS

Appearance of solution. Dissolve 0.25 g in *alcohol R* and dilute to 10 ml with the same solvent. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Related substances. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution (a). Dissolve 0.50 g of the substance to be examined in *acetone R* and dilute to 5 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 100 ml with *acetone R*.

Reference solution (a). Dilute 1 ml of test solution (b) to 10 ml with *acetone R*.

Reference solution (b). Dissolve 10 mg of *prazepam CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (c). Dissolve 15 mg of *nordazepam CRS* in *acetone R* and dilute to 50 ml with the same solvent.

Reference solution (d). To 1 ml of reference solution (a) add 1 ml of reference solution (c) and mix.

Apply to the plate 5 µl of each solution. Develop over a path of 10 cm using a freshly prepared mixture of 50 volumes of *ethyl acetate R* and 50 volumes of *heptane R*. Dry the plate in air and examine in ultraviolet light at 254 nm and 365 nm. In the chromatogram obtained with test solution (a): any spot corresponding to nordazepam is not more intense than the spot in the chromatogram obtained with reference solution (c) (0.3 per cent); not more than four additional spots are present, none of which are more intense than the spot in the chromatogram obtained with reference solution (a) (0.1 per cent). The test is not valid unless the chromatogram obtained with reference solution (d) shows two clearly separated spots.

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 25 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 32.48 mg of $C_{19}H_{17}ClN_2O$.

STORAGE

Store protected from light.

IMPURITIES

A. 7-chloro-5-phenyl-1,3-dihydro-2H-1,4-benzodiazepin-2-one (nordazepam),

B. [5-chloro-2-[(cyclopropylmethyl)amino]phenyl]phenylmethanone,

C. (2-amino-5-chlorophenyl)phenylmethanone.

01/2005:0855

PRAZIQUANTEL

Praziquantelum

and enantiomer

$C_{19}H_{24}N_2O_2$

M_r 312.4

DEFINITION

(11bRS)-2-(Cyclohexylcarbonyl)-1,2,3,6,7,11b-hexahydro-4H-pyrazino[2,1-a]isoquinolin-4-one.

Content: 97.5 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: very slightly soluble in water, freely soluble in alcohol and in methylene chloride.

It shows polymorphism.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: *praziquantel CRS*.

If the spectra obtained show differences, dissolve 50 mg of the substance to be examined and 50 mg of the reference substance separately in 2 ml of *methanol R*. Evaporate and dry the residue at 60 °C at a pressure not exceeding 0.7 kPa. Record new spectra using the residues.

TESTS

Related substances. Liquid chromatography (2.2.29).

Test solution (a). Dissolve 40.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Test solution (b). Dilute 1.0 ml of test solution (a) to 20.0 ml with the mobile phase.

Reference solution (a). Dissolve 40.0 mg of praziquantel CRS in the mobile phase and dilute to 10.0 ml with the mobile phase. Dilute 1.0 ml to 20.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of praziquantel impurity A CRS in reference solution (a) and dilute to 25.0 ml with reference solution (a). Dilute 2.0 ml of this solution to 20.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of test solution (a) to 20.0 ml with the mobile phase. Dilute 5.0 ml of this solution to 50.0 ml with the mobile phase.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.0$ mm,
- **stationary phase:** octadecylsilyl silica gel for chromatography R (5 μ m).

Mobile phase: acetonitrile R, water R (45:55 V/V).

Flow rate: 1 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 20 μ l; inject test solution (a) and reference solutions (b) and (c).

Run time: 5 times the retention time of praziquantel (retention time = about 9 min).

System suitability: reference solution (b):

- **resolution:** minimum 3.0 between the peaks corresponding to impurity A and praziquantel.

Limits:

- **any impurity:** not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent), not more than 1 such peak having an area greater than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent),
- **total:** not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent),
- **disregard limit:** 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test C. Prepare the standard using 2 ml of lead standard solution (10 ppm Pb) R.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 50 °C over diphosphorus pentoxide R at a pressure not exceeding 0.7 kPa for 2 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modification.

Injection: test solution (b) and reference solution (a).

Calculate the percentage content of $C_{19}H_{24}N_2O_2$.

STORAGE

Protected from light.

IMPURITIES

A. (11bRS)-2-benzoyl-1,2,3,6,7,11b-hexahydro-4H-pyrazino[2,1-a]isoquinolin-4-one,

B. 2-(cyclohexylcarbonyl)-2,3,6,7-tetrahydro-4H-pyrazino[2,1-a]isoquinolin-4-one,

C. N-formyl-N-[2-oxo-2-(1-oxo-3,4-dihydroisoquinolin-2(1H-yl)ethyl)cyclohexanecarboxamide.

01/2005:0856

PRAZOSIN HYDROCHLORIDE

Prazosini hydrochloridum

$C_{19}H_{22}ClN_5O_4$

M_r 419.9

DEFINITION

1-(4-Amino-6,7-dimethoxyquinazolin-2-yl)-4-(furan-2-ylcarbonyl)piperazine hydrochloride.

Content: 98.5 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: very slightly soluble in water, slightly soluble in alcohol and in methanol, practically insoluble in acetone.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. Dissolve 50.0 mg in a 0.1 per cent V/V solution of *hydrochloric acid R* in *methanol R* and dilute to 100.0 ml with the same acid solution. Dilute separately 1.0 ml and 5.0 ml of this solution to 100.0 ml with a 0.1 per cent V/V solution of *hydrochloric acid R* in *methanol R* (solution A and solution B, respectively). Examined between 220 nm and 280 nm (2.2.25), solution A shows an absorption maximum at 247 nm. The specific absorbance at the maximum is 1320 to 1400. Examined between 280 nm and 400 nm, solution B shows 2 absorption maxima, at 330 nm and 343 nm. The specific absorbances at the maxima are 260 to 280 and 240 to 265, respectively.

B. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs of *potassium chloride R*.

Comparison: *prazosin hydrochloride CRS*.

C. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 10 mg of the substance to be examined in a mixture of 1 volume of *diethylamine R*, 10 volumes of *methanol R* and 10 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution. Dissolve 10 mg of *prazosin hydrochloride CRS* in a mixture of 1 volume of *diethylamine R*, 10 volumes of *methanol R* and 10 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Plate: TLC silica gel GF₂₅₄ plate *R*.

Mobile phase: *diethylamine R*, *ethyl acetate R* (5:95 V/V).

Application: 10 µl.

Development: over 2/3 of the plate.

Drying: in a current of warm air.

Detection: examine in ultraviolet light at 254 nm.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

D. Dissolve about 2 mg in 2 ml of *water R*. The solution gives reaction (a) of chlorides (2.3.1).

TESTS

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 8 mg of *metoclopramide hydrochloride CRS* in 1 ml of the test solution and dilute to 25.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Column:

- *size*: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- *stationary phase*: *octadecylsilyl silica gel for chromatography R* (5 µm),

Mobile phase: mix 50 volumes of *methanol R* and 50 volumes of a solution containing 3.484 g/l of *sodium pentanesulphonate R* and 3.64 g/l of *tetramethylammonium hydroxide R* adjusted to pH 5.0 with *glacial acetic acid R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 µl.

Run time: 6 times the retention time of prazosin.

Retention times: prazosin = about 9 min;
metoclopramide = about 5 min.

System suitability: reference solution (b):

- *resolution*: minimum 8 between the peaks due to metoclopramide and to prazosin.

Limits:

- *any impurity*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),
- *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Iron: maximum 100 ppm.

Atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. To 1.0 g add dropwise about 1.5 ml of *nitric acid R*. After fuming has subsided, evaporate on a water-bath and ignite by gradually raising the temperature from 150 °C to 1000 °C, maintaining the final temperature for 1 h. Cool, dissolve the residue in 20 ml of *dilute hydrochloric acid R*, evaporate to about 5 ml and dilute to 25.0 ml with *dilute hydrochloric acid R*.

Reference solutions. Prepare the reference solutions using *iron standard solution (8 ppm Fe) R*, diluted as necessary with *water R*.

Source: iron hollow-cathode lamp.

Wavelength: 248 nm.

Flame: air-acetylene.

Nickel: maximum 50 ppm.

Atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Use the test solution prepared in the test for iron.

Reference solutions. Prepare the reference solutions using *nickel standard solution (10 ppm Ni) R*, diluted as necessary with *water R*.

Source: nickel hollow-cathode lamp.

Wavelength: 232 nm.

Flame: air-acetylene.

Water (2.5.12): maximum 0.5 per cent, determined on 1.000 g. Use a mixture of equal volumes of *methanol R* and *methylene chloride R* as the solvent.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

In order to avoid overheating in the reaction medium, mix thoroughly throughout and stop the titration immediately after the end-point has been reached.

Dissolve 0.350 g in a mixture of 20 ml of *anhydrous formic acid R* and 30 ml of *acetic anhydride R*. Titrate quickly with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 41.99 mg of $C_{19}H_{22}ClN_5O_4$.

STORAGE

Protected from light.

IMPURITIES

A. Ar-Cl: 2-chloro-6,7-dimethoxyquinazolin-4-amine,

B. 1,4-bis(furan-2-ylcarbonyl)piperazine,

C. 6,7-dimethoxy-2-(piperazin-1-yl)quinazolin-4-amine,

D. 1-(furan-2-ylcarbonyl)piperazine,

E. 2,2'-(piperazin-1,4-diyl)bis(6,7-dimethoxyquinazolin-4-amine).

01/2005:1467

PREDNICARBATE

Prednicarbatum

$C_{27}H_{36}O_8$

M_r 488.6

DEFINITION

Prednicarbate contains not less than 97.0 per cent and not more than the equivalent of 102.0 per cent of 11 β -hydroxy-3,20-dioxopregna-1,4-diene-17,21-diyl 17-ethylcarbonate 21-propanoate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, freely soluble in alcohol and in acetone, sparingly soluble in propylene glycol.

It shows polymorphism.

IDENTIFICATION

A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *prednicarbate CRS*. If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of *alcohol R*, evaporate to dryness on a water-bath and record the spectra again using the residues.

B. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*.

Test solution. Dissolve 10 mg of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dissolve 10 mg of *prednicarbate CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dissolve 5 mg of *prednisolone acetate CRS* in 5 ml of reference solution (a).

Apply to the plate 5 μ l of each solution. Prepare the mobile phase by adding a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R*. Develop over a path of 15 cm. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). Spray the plate with *alcoholic solution of sulphuric acid R*. Heat at 120 °C for 10 min or until the spots appear. Allow to cool. Examine in daylight and in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

TESTS

Specific optical rotation (2.2.7). Dissolve 0.250 g in *alcohol R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 60 to + 66, calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29) as described under Assay.

Inject 20 μ l of reference solution (a). Adjust the sensitivity of the system so that the heights of the two principal peaks in the chromatogram obtained are about 50 per cent of the full scale of the recorder. When the chromatograms are recorded in the conditions described above, the retention times are: prednicarbate about 17 min and impurity F about 19 min. The test is not valid unless the resolution between the peaks corresponding to prednicarbate and impurity F is at least 3.0; if this resolution is not achieved, adjust the composition of the mobile phase.

Inject 20 μ l of the test solution and 20 μ l of reference solution (b). Continue the chromatography for twice the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak corresponding to impurity F is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent); the area of any peak, apart from the principal peak and a peak corresponding to impurity F, is not greater than the area of the principal peak

in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than four times the area of the principal peak in the chromatogram obtained with reference solution (b) (2 per cent). Disregard any peak with an area less than 0.025 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

ASSAY

Examine by liquid chromatography (2.2.29). *Prepare the solutions immediately before use.*

Test solution. Dissolve 30.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 3 mg of *prednicarbate impurity F CRS* in the mobile phase, add 5.0 ml of the test solution and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Reference solution (c). Dissolve 30.0 mg of *prednicarbate CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.125 m long and 4 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 0.7 ml/min a mixture of 5 volumes of *acetonitrile R* and 6 volumes of *water R*,
- as detector a spectrophotometer set at 243 nm.

Inject 20 µl of reference solution (a). When the chromatograms are recorded in the prescribed conditions the retention times are: prednicarbate about 17 min and impurity F about 19 min. The test is not valid unless the resolution between the peaks corresponding to prednicarbate and impurity F is not less than 3.0; if this resolution is not achieved, adjust the composition of the mobile phase.

Inject 20 µl of reference solution (c). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained is at least 50 per cent of the full scale of the recorder.

Inject 20 µl of the test solution.

Calculate the percentage content of prednicarbate.

STORAGE

Store protected from light.

IMPURITIES

- A. R = R' = H: prednisolone,
 B. R = CO-O-C₂H₅, R' = H: prednisolone 17-ethylcarbonate,
 C. R = H, R' = CO-C₂H₅: prednisolone 21-propanoate,
 D. R = H, R' = CO-O-C₂H₅: prednisolone 21-ethylcarbonate,
 E. R = CO-O-C₂H₅, R' = CO-CH₃: prednisolone 21-acetate 17-ethylcarbonate,

F. 11β-hydroxy-3,20-dioxopregn-4-ene-17,21-diyl 17-ethylcarbonate 21-propanoate(1,2-dihydroprednicarbate).

01/2005:0353

PREDNISOLONE

Prednisolonum

C₂₁H₂₈O₅

M_r 360.4

DEFINITION

Prednisolone contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of 11β,17,21-trihydroxypregna-1,4-diene-3,20-dione, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, hygroscopic, very slightly soluble in water, soluble in alcohol and in methanol, sparingly soluble in acetone, slightly soluble in methylene chloride.

It shows polymorphism.

IDENTIFICATION

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *prednisolone CRS*. If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of *acetone R* and evaporate to dryness on a water-bath. Record new spectra using the residues.
- B. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 10 mg of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dissolve 20 mg of *prednisolone CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 20 ml with the same mixture of solvents.

Reference solution (b). Dissolve 10 mg of *hydrocortisone CRS* in reference solution (a) and dilute to 10 ml with reference solution (a).

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *methanol R* and 90 volumes of *methylene chloride R*. Allow the plate to dry in air and examine in ultraviolet

light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). Spray with *alcoholic solution of sulphuric acid R*. Heat at 120 °C for 10 min or until the spots appear. Allow to cool. Examine the chromatograms in daylight and in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

TESTS

Specific optical rotation (2.2.7). Dissolve 0.250 g in *dioxan R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 96 to + 102, calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in 2 ml of *tetrahydrofuran R* and dilute to 10.0 ml with *water R*.

Reference solution (a). Dissolve 2 mg of *prednisolone CRS* and 2 mg of *hydrocortisone CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture prepared as follows: in a 1000 ml volumetric flask mix 220 ml of *tetrahydrofuran R* with 700 ml of *water R* and allow to equilibrate; dilute to 1000 ml with *water R* and mix again,
- as detector a spectrophotometer set at 254 nm, maintaining the temperature of the column at 45 °C.

Equilibrate the column with the mobile phase at a flow rate of 1 ml/min for about 30 min.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 20 µl of reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 20 µl of reference solution (a). When the chromatograms are recorded in the prescribed conditions, the retention times are: prednisolone about 14 min and hydrocortisone about 15.5 min. The test is not valid unless in the chromatogram obtained with reference solution (a) the resolution between the peaks due to prednisolone and hydrocortisone is at least 2.2. If necessary, adjust the concentration of *tetrahydrofuran R* in the mobile phase.

Inject separately 20 µl of the solvent mixture of the test solution as a blank, 20 µl of the test solution and 20 µl of reference solution (b). Continue the chromatography of the test solution for 4.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent) and not more than one such peak has an area greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum

of the areas of all the peaks, apart from the principal peak, is not greater than 2.0 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2 per cent). Disregard any peak obtained with the blank run and any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 0.500 g by drying in an oven at 100-105 °C.

ASSAY

Dissolve 0.100 g in *alcohol R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml of the solution to 100.0 ml with *alcohol R*. Measure the absorbance (2.2.25) at the maximum at 243.5 nm.

Calculate the content of C₂₁H₂₈O₅ taking the specific absorbance to be 415.

STORAGE

Store in an airtight container, protected from light.

IMPURITIES

A. hydrocortisone.

PREDNISOLONE ACETATE

Prednisoloni acetat

C₂₃H₃₀O₆

M_r 402.5

DEFINITION

Prednisolone acetate contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of 11β,17-dihydroxy-3,20-dioxopregna-1,4-dien-21-yl acetate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, slightly soluble in alcohol and in methylene chloride.

It melts at about 230 °C, with decomposition.

IDENTIFICATION

First identification: A, B.

Second identification: C, D, E.

A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *prednisolone acetate CRS*. Examine the substances prepared as discs.

B. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 10 mg of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dissolve 20 mg of *prednisolone acetate CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 20 ml with the same mixture of solvents.

Reference solution (b). Dissolve 10 mg of *prednisolone pivalate CRS* in reference solution (a) and dilute to 10 ml with the same solution.

Apply separately to the plate 5 µl of each solution. Prepare the mobile phase by adding a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R*. Develop over a path of 15 cm. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). Spray the plate with *alcoholic solution of sulphuric acid R*. Heat at 120 °C for 10 min or until the spots appear. Allow to cool. Examine in daylight and in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

- C. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution (a). Dissolve 25 mg of the substance to be examined in *methanol R* with gentle heating and dilute to 5 ml with the same solvent. This solution is also used to prepare test solution (b). Dilute 2 ml of the solution to 10 ml with *methylene chloride R*.

Test solution (b). Transfer 2 ml of the solution obtained during preparation of test solution (a) to a 15 ml glass tube with a ground-glass stopper or a polytetrafluoroethylene cap. Add 10 ml of *saturated methanolic potassium hydrogen carbonate solution R* and immediately pass a stream of *nitrogen R* briskly through the solution for 5 min. Stopper the tube. Heat in a water-bath at 45 °C, protected from light, for 2 h 30 min. Allow to cool.

Reference solution (a). Dissolve 25 mg of *prednisolone acetate CRS* in *methanol R* with gentle heating and dilute to 5 ml with the same solvent. This solution is also used to prepare reference solution (b). Dilute 2 ml of the solution to 10 ml with *methylene chloride R*.

Reference solution (b). Transfer 2 ml of the solution obtained during preparation of reference solution (a) to a 15 ml glass tube with a ground-glass stopper or a polytetrafluoroethylene cap. Add 10 ml of *saturated methanolic potassium hydrogen carbonate solution R* and immediately pass a stream of *nitrogen R* briskly through the solution for 5 min. Stopper the tube. Heat in a water-bath at 45 °C, protected from light, for 2 h 30 min. Allow to cool.

Apply separately to the plate 5 µl of each solution. Prepare the mobile phase by adding a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R*. Develop over a path of 15 cm. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in each of the chromatograms obtained with the test solutions is similar in position and size to the principal spot in the chromatogram obtained with the corresponding reference solution. Spray the plate

with *alcoholic solution of sulphuric acid R*. Heat at 120 °C for 10 min or until the spots appear. Allow to cool. Examine in daylight and in ultraviolet light at 365 nm. The principal spot in each of the chromatograms obtained with the test solutions is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with the corresponding reference solution. The principal spot in each of the chromatograms obtained with test solution (b) and reference solution (b) has an R_f value distinctly lower than that of the principal spots in each of the chromatograms obtained with test solution (a) and reference solution (a).

- D. Add about 2 mg to 2 ml of *sulphuric acid R* and shake to dissolve. Within 5 min, an intense red colour develops. When examined in ultraviolet light at 365 nm, a reddish-brown fluorescence is seen. Add the solution to 10 ml of *water R* and mix. The colour fades and there is greenish-yellow fluorescence in ultraviolet light at 365 nm.

- E. About 10 mg gives the reaction of acetyl (2.3.1).

TESTS

Specific optical rotation (2.2.7). Dissolve 0.250 g in *dioxan R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 112 to + 119, calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 2 mg of *prednisolone acetate CRS* and 2 mg of *hydrocortisone acetate CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter, packed with *base-deactivated end-capped octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture prepared as follows: in a 1000 ml volumetric flask mix 350 ml of *acetonitrile R* with 600 ml of *water R* and allow to equilibrate; adjust the volume to 1000 ml with *water R* and mix again,
- as detector a spectrophotometer set at 254 nm.

Equilibrate the column with the mobile phase at a flow rate of 1 ml/min for about 30 min.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 20 µl of reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 20 µl of reference solution (a). When the chromatograms are recorded in the prescribed conditions, the retention times are: prednisolone acetate, about 24 min and hydrocortisone acetate, about 26 min. The test is not valid unless the resolution between the peaks corresponding to prednisolone acetate and hydrocortisone acetate is at least 2.5; if necessary, adjust the concentration of acetonitrile in the mobile phase.

Inject separately 20 µl of the test solution and 20 µl of reference solution (b). Continue the chromatography for 2.5 times the retention time of the principal peak in the chromatogram obtained with the test solution. In the chromatogram obtained with the test solution: the area of

any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent) and not more than one such peak has an area greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2 per cent). Disregard any peak due to the solvent and any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

ASSAY

Dissolve 0.100 g in *alcohol R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml of the solution to 100.0 ml with *alcohol R*. Measure the absorbance (2.2.25) at the maximum at 243 nm.

Calculate the content of $C_{26}H_{30}O_6$ taking the specific absorbance to be 370.

STORAGE

Store protected from light.

IMPURITIES

- A. hydrocortisone acetate,
- B. prednisolone.

01/2005:0736

PREDNISOLONE PIVALATE

Prednisoloni pivalas

$C_{26}H_{36}O_6$

M_r 444.6

DEFINITION

Prednisolone pivalate contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of 11 β ,17-dihydroxy-3,20-dioxopregna-1,4-dien-21-yl 2,2-dimethylpropanoate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, slightly soluble in alcohol, soluble in methylene chloride.

It melts at about 229 °C, with decomposition.

IDENTIFICATION

First identification: B, C.

Second identification: A, C, D.

- A. Dissolve 10.0 mg in *ethanol R* and dilute to 100.0 ml with the same solvent. Place 2.0 ml of this solution in a ground-glass-stoppered tube, add 10.0 ml of

phenylhydrazine-sulphuric acid solution R, mix and heat in a water-bath at 60 °C for 20 min. Cool immediately. The absorbance (2.2.25) of the solution at the maximum at 415 nm is 0.20 to 0.30.

- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *prednisolone pivalate CRS*. If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of *alcohol R*, evaporate to dryness on a water-bath and record the spectra again using the residues.
- C. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 10 mg of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dissolve 10 mg of *prednisolone pivalate CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dissolve 10 mg of *prednisolone acetate CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents. Dilute 5 ml of this solution to 10 ml with reference solution (a).

Apply separately to the plate 5 μ l of each solution. Prepare the mobile phase by adding a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R*. Develop over a path of 15 cm. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). Spray the plate with *alcoholic solution of sulphuric acid R*. Heat at 120 °C for 10 min or until the spots appear. Allow to cool. Examine in daylight and in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

- D. Add about 2 mg to 2 ml of *sulphuric acid R* and shake to dissolve. Within 5 min, an intense red colour develops. When examined in ultraviolet light at 365 nm, a reddish-brown fluorescence is seen. Add the solution to 10 ml of *water R* and mix. The colour fades and there is greenish-yellow fluorescence in ultraviolet light at 365 nm.

TESTS

Specific optical rotation (2.2.7). Dissolve 0.250 g in *dioxan R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 104 to + 112, calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 62.5 mg of the substance to be examined in 2 ml of a mixture of 1 volume of *water R* and 4 volumes of *tetrahydrofuran R* and dilute to 25.0 ml with the mobile phase.

01/2005:0735

Reference solution (a). Dissolve 25 mg of *prednisolone acetate CRS*, 25 mg of *cortisone acetate CRS* and 25 mg of *prednisolone pivalate CRS* in 2 ml of a mixture of 1 volume of *water R* and 4 volumes of *tetrahydrofuran R* and dilute to 25.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 25.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture prepared as follows: mix 19 ml of *butyl acetate R1* carefully with 37 ml of *tetrahydrofuran R* and 213 ml of *ethylene glycol monomethyl ether R* and then with 231 ml of *water R*, leave to equilibrate for 1 h and filter through a 0.45 µm filter,
- as detector a spectrophotometer set at 254 nm.

Adjust the sensitivity so that the height of the principal peak in the chromatogram obtained with reference solution (b) is 70 per cent to 90 per cent of the full scale.

Equilibrate the column with the mobile phase at a flow rate of 1 ml/min for about 30 min.

Inject 20 µl of reference solution (a). When the chromatograms are recorded in the conditions described above the retention times are: prednisolone acetate about 3.5 min, cortisone acetate about 4.5 min and prednisolone pivalate about 13 min. The test is not valid unless the resolution between the peaks corresponding to prednisolone acetate and cortisone acetate is at least 2.5; if this resolution is not achieved, adjust the concentration of water in the mobile phase.

Inject separately 20 µl of the test solution and 20 µl of reference solution (b). Continue the chromatography for 1.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak apart from the principal peak is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent) and not more than one such peak has an area greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent); the sum of the areas of all the peaks apart from the principal peak is not greater than 1.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2.5 per cent). Disregard any peak due to the solvent and any peak with an area less than 0.025 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

ASSAY

Dissolve 0.100 g in *alcohol R* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of the solution to 250.0 ml with *alcohol R*. Measure the absorbance (2.2.25) at the maximum at 243 nm.

Calculate the content of $C_{21}H_{27}O_6$ taking the specific absorbance to be 337.

STORAGE

Store protected from light.

PREDNISOLONE SODIUM PHOSPHATE

Prednisoloni natrii phosphas

 $C_{21}H_{27}Na_2O_8P$
 M_r 484.4

DEFINITION

Prednisolone sodium phosphate contains not less than 96.0 per cent and not more than the equivalent of 103.0 per cent of 11β,17-dihydroxy-3,20-dioxpregna-1,4-dien-21-yl disodium phosphate, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, hygroscopic, freely soluble in water, very slightly soluble in alcohol.

IDENTIFICATION

First identification: B, C.

Second identification: A, C, D, E.

- Dissolve 10.0 mg in 5 ml of *water R* and dilute to 100.0 ml with *ethanol R*. Place 2.0 ml of this solution in a ground-glass-stoppered tube, add 10.0 ml of *phenylhydrazine-sulphuric acid solution R*, mix and heat in a water-bath at 60 °C for 20 min. Cool immediately. The absorbance (2.2.25) of the solution at the maximum at 415 nm is 0.10 to 0.20.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *prednisolone sodium phosphate CRS*. If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of *alcohol R*, evaporate to dryness on a water-bath and record the spectra again using the residues.
- Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *prednisolone sodium phosphate CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *dexamethasone sodium phosphate CRS* in *methanol R* and dilute to 10 ml with the same solvent. Dilute 5 ml of this solution to 10 ml with reference solution (a).

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of *glacial acetic acid R*, 20 volumes of *water R* and 60 volumes of *butanol R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the

principal spot in the chromatogram obtained with reference solution (a). Spray the plate with *alcoholic solution of sulphuric acid R*. Heat at 120 °C for 10 min or until the spots appear. Allow to cool. Examine in daylight and in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two spots which may however not be completely separated.

- D. Add about 2 mg to 2 ml of *sulphuric acid R* and shake to dissolve. Within 5 min, an intense red colour develops. When examined in ultraviolet light at 365 nm, a reddish-brown fluorescence is seen. Add the solution to 10 ml of *water R* and mix. The colour fades and there is greenish-yellow fluorescence in ultraviolet light at 365 nm.
- E. To about 40 mg add 2 ml of *sulphuric acid R* and heat gently until white fumes are evolved. Add *nitric acid R* dropwise, continue the heating until the solution is almost colourless and cool. Add 2 ml of *water R*, heat until white fumes are again evolved, cool, add 10 ml of *water R* and neutralise to *red litmus paper R* with *dilute ammonia R1*. The solution gives reaction (a) of sodium (2.3.1) and reaction (b) of phosphates (2.3.1).

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution B₇ (2.2.2, Method II).

pH (2.2.3). The pH of solution S is 7.5 to 9.0.

Specific optical rotation (2.2.7). Dissolve 0.250 g in *water R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 94 to + 100, calculated with reference to the anhydrous substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 62.5 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dissolve 25 mg of *prednisolone sodium phosphate CRS* and 25 mg of *prednisolone CRS* in the mobile phase and dilute to 25.0 ml with the same solvent. Dilute 1.0 ml of this solution to 25.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture prepared as follows: in a 250 ml conical flask weigh 1.360 g of *potassium dihydrogen phosphate R* and 0.600 g of *hexylamine R*, mix and allow to stand for 10 min and then dissolve in 185 ml of *water R*; add 65 ml of *acetonitrile R*, mix and filter through a 0.45 µm filter,
- as detector a spectrophotometer set at 254 nm.

Inject 20 µl of reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with reference solution (b) is 70 per cent to 90 per cent of the full scale of the recorder.

Equilibrate the column with the mobile phase at a flow rate of 1 ml/min for about 30 min.

Inject 20 µl of reference solution (a). When the chromatograms are recorded in the conditions described above the retention times are: *prednisolone sodium phosphate*, about 6.5 min and *prednisolone*, about 8.5 min. The test is not valid unless the resolution between the peaks corresponding to *prednisolone sodium phosphate* and *prednisolone* is at least 4.5; if this resolution is not achieved, increase the concentration of *acetonitrile R* or increase the concentration of *water R* in the mobile phase.

Inject separately 20 µl of the test solution and 20 µl of reference solution (b). Continue the chromatography for three times the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak apart from the principal peak is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (2 per cent) and not more than one such peak has an area greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent); the sum of the areas of all the peaks apart from the principal peak is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3 per cent). Disregard any peak due to the solvent and any peak with an area less than 0.025 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Inorganic phosphate. Dissolve 50 mg in *water R* and dilute to 100 ml with the same solvent. To 10 ml of this solution add 5 ml of *molybdovanadic reagent R*, mix and allow to stand for 5 min. Any yellow colour in the solution is not more intense than that in a standard prepared at the same time in the same manner using 10 ml of *phosphate standard solution* (5 ppm PO₄) *R* (1 per cent).

Water (2.5.12). Not more than 8.0 per cent, determined on 0.200 g by the semi-micro determination of water.

ASSAY

Dissolve 0.100 g in *water R* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of the solution to 250.0 ml with *water R*. Measure the absorbance (2.2.25) at the maximum at 247 nm.

Calculate the content of C₂₁H₂₇Na₂O₈P taking the specific absorbance to be 312.

STORAGE

Store protected from light.

01/2005:0354

PREDNISONE

Prednisonum

C₂₁H₂₆O₅

M_r 358.4

DEFINITION

Prednisone contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of 17,21-dihydroxypregna-1,4-diene-3,11,20-trione, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, slightly soluble in alcohol and in methylene chloride.

It shows polymorphism.

IDENTIFICATION

First identification: A, B.

Second identification: C, D.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *prednisone CRS*. If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of *acetone R*, evaporate to dryness on a water-bath and record new spectra using the residues.
- B. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 10 mg of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dissolve 20 mg of *prednisone CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 20 ml with the same mixture of solvents.

Reference solution (b). Dissolve 10 mg of *betamethasone CRS* in reference solution (a) and dilute to 10 ml with the same solution.

Apply to the plate 5 µl of each solution. Prepare the mobile phase by adding a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R*. Develop over a path of 15 cm. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). Spray with *alcoholic solution of sulphuric acid R*. Heat at 120 °C for 10 min or until the spots appear. Allow to cool. Examine the plate in daylight and in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

- C. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution (a). Dissolve 25 mg of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent. This solution is also used to prepare test solution (b). Dilute 2 ml of the solution to 10 ml with *methylene chloride R*.

Test solution (b). Transfer 0.4 ml of the solution obtained during preparation of test solution (a) to a glass tube 100 mm long and 20 mm in diameter and fitted with a ground-glass stopper or a polytetrafluoroethylene cap and evaporate the solvent with gentle heating under a stream of *nitrogen R*. Add 2 ml of a 15 per cent V/V solution of *glacial acetic acid R* and 50 mg of *sodium bismuthate R*. Stopper the tube and shake the suspension in a mechanical shaker, protected from light, for 1 h. Add 2 ml of a 15 per cent V/V solution of *glacial acetic acid R* and filter into a 50 ml separating funnel, washing the filter with two quantities, each of 5 ml, of *water R*. Shake the clear filtrate with 10 ml of *methylene chloride R*. Wash the organic layer with 5 ml of 1 M *sodium hydroxide* and two quantities, each of 5 ml, of *water R*. Dry over *anhydrous sodium sulphate R*.

Reference solution (a). Dissolve 25 mg of *prednisone CRS* in *methanol R* and dilute to 5 ml with the same solvent. This solution is also used to prepare reference solution (b). Dilute 2 ml of the solution to 10 ml with *methylene chloride R*.

Reference solution (b). Transfer 0.4 ml of the solution obtained during preparation of reference solution (a) to a glass tube 100 mm long and 20 mm in diameter and fitted with a ground-glass stopper or a polytetrafluoroethylene cap and evaporate the solvent with gentle heating under a stream of *nitrogen R*. Add 2 ml of a 15 per cent V/V solution of *glacial acetic acid R* and 50 mg of *sodium bismuthate R*. Stopper the tube and shake the suspension in a mechanical shaker, protected from light, for 1 h. Add 2 ml of a 15 per cent V/V solution of *glacial acetic acid R* and filter into a 50 ml separating funnel, washing the filter with two quantities, each of 5 ml, of *water R*. Shake the clear filtrate with 10 ml of *methylene chloride R*. Wash the organic layer with 5 ml of 1 M *sodium hydroxide* and two quantities, each of 5 ml, of *water R*. Dry over *anhydrous sodium sulphate R*.

Apply to the plate 5 µl of test solution (a) and reference solution (a) and 50 µl of test solution (b) and reference solution (b), applying the latter two in small quantities in order to obtain small spots. Prepare the mobile phase by adding a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R*. Develop over a path of 15 cm. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in each of the chromatograms obtained with the test solutions is similar in position and size to the principal spot in the chromatogram obtained with the corresponding reference solution. Spray with *alcoholic solution of sulphuric acid R*. Heat at 120 °C for 10 min or until the spots appear. Allow to cool. Examine the chromatograms in daylight and in ultraviolet light at 365 nm. The principal spot in each of the chromatograms obtained with the test solutions is similar in position, colour in daylight, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with the corresponding reference solution. The principal spots in the chromatograms obtained with test solution (b) and reference solution (b) have an R_f value distinctly higher than that of the principal spots in the chromatograms obtained with test solution (a) and reference solution (a).

- D. Add about 2 mg to 2 ml of *sulphuric acid R* and shake to dissolve. Within 5 min, a yellow colour develops with a blue fluorescence in ultraviolet light at 365 nm. Add the solution to 10 ml of *water R* and mix. The colour fades but the blue fluorescence in ultraviolet light does not disappear.

TESTS

Specific optical rotation (2.2.7). Dissolve 0.125 g in *dioxan R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 167 to + 175, calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 2 mg of *prednisone CRS* and 2 mg of *prednisolone CRS* in *methanol R* and dilute to 100.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter, packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 2.5 ml/min a linear gradient programme using the following conditions:
Mobile phase A. In a 1000 ml volumetric flask mix 100 ml of *acetonitrile R* with 200 ml of *methanol R* and 650 ml of *water R* and allow to equilibrate; adjust the volume to 1000 ml with *water R* and mix again,
Mobile phase B. *Acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0	100	0	isocratic
25	100	0	begin linear gradient
40	40	60	end chromatogram, change to 100B
41	0	100	begin treatment with B
46	0	100	end treatment, return to 100A
47	100	0	begin equilibration with A
52 = 0	100	0	end equilibration, begin next chromatogram

- as detector a spectrophotometer set at 254 nm, maintaining the temperature of the column at 45 °C.
- Equilibrate the column for at least 30 min with mobile phase B at a flow rate of 2.5 ml/min and then with the mobile phase A for 5 minutes. For subsequent chromatograms, use the conditions described from 40.0 to 52.0 min. Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 20 µl of reference solution (b) is not less than 50 per cent of the full scale of the recorder.

Inject 20 µl of reference solution (a). When the chromatograms are recorded in the prescribed conditions, the retention times are: prednisone, about 19 minutes and prednisolone, about 23 minutes. The test is not valid unless the resolution between the peaks corresponding to prednisone and prednisolone is at least 2.7; if necessary, adjust the concentration of acetonitrile in mobile phase A. Inject separately 20 µl of *methanol R* as a blank, 20 µl of the test solution and 20 µl of reference solution (b). In the chromatogram obtained with the test solution: the area of any peak apart from the principal peak is not greater than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than 0.75 times the area of the

principal peak in the chromatogram obtained with reference solution (b) (0.75 per cent). Disregard any peak due to the blank run and any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 0.500 g by drying in an oven at 100 °C to 105 °C.

ASSAY

Dissolve 0.100 g in *alcohol R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml of the solution to 100.0 ml with *alcohol R*. Measure the absorbance (2.2.25) at the maximum at 238 nm.

Calculate the content of C₂₁H₂₆O₅ taking the specific absorbance to be 425.

STORAGE

Store protected from light.

01/2005:1362

PRILOCAINE

Prilocainum

C₁₃H₂₀N₂OM_r 220.3

DEFINITION

Prilocaine contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (RS)-N-(2-methylphenyl)-2-(propylamino)propanamide, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, slightly soluble in water, very soluble in acetone and in alcohol.

IDENTIFICATION

First identification: B.

Second identification: A, C.

- Melting point (2.2.14): 36 °C to 39 °C, determined without previous drying.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *prilocaine CRS*. Examine the substances by applying 50 µl of a 30 g/l solution in *ether R* to *potassium bromide R* discs and evaporating the solvent.
- Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel GF₂₅₄ plate R*.

Test solution. Dissolve 20.0 mg of the substance to be examined in *alcohol R* and dilute to 5 ml with the same solvent.

Reference solution (a). Dissolve 20.0 mg of *prilocaine CRS* in *alcohol R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dissolve 20.0 mg of *prilocaine CRS* and 20.0 mg of *lidocaine CRS* in *alcohol R* and dilute to 5 ml with the same solvent.

Apply to the plate 10 µl of each solution. Develop over a path of 12 cm, using a mixture of 1 volume of *concentrated ammonia R*, 5 volumes of *methanol R* and

100 volumes of *ether R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

TESTS

Solution S. Dissolve 2.50 g in 15 ml of *dilute hydrochloric acid R* and dilute to 50.0 ml with *water R*.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Optical rotation (2.2.7). The angle of optical rotation, determined on solution S, is -0.10° to $+0.10^\circ$.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 2.5 mg of the substance to be examined and 3.0 mg of *prilocaine impurity E CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml to 10.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.125 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 μ m),
- as mobile phase at a flow rate of 1 ml/min a mixture of 40 volumes of *acetonitrile R* and 60 volumes of a solution prepared as follows: dissolve 0.180 g of *sodium dihydrogen phosphate monohydrate R* and 2.89 g of *disodium hydrogen phosphate dihydrate R* in 1000 ml of *water R* (pH 8.0),
- as detector a spectrophotometer set at 240 nm.

Inject 20 μ l of reference solution (a). Adjust the sensitivity of the system so that the heights of the two principal peaks in the chromatogram obtained are at least 20 per cent of the full scale of the recorder. The test is not valid unless the resolution between the peaks corresponding to impurity E and prilocaine is at least 3.0. Inject 20 μ l of the test solution and 20 μ l of reference solution (b). Continue the chromatography of the test solution for twice the retention time of prilocaine, which is about 7 min. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and not more than one such peak has an area greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than five times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Disregard any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b).

***o*-Toluidine.** Use freshly prepared solutions. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution. Dissolve 10.0 mg of *o*-toluidine hydrochloride *R* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Carry out the chromatography using the same system as described under Related substances. Inject 20 μ l of the reference solution. Adjust the sensitivity of the system so that the height of the peak in the chromatogram obtained is at least 50 per cent of the full scale of the recorder. Inject 20 μ l of the test solution. Continue the chromatography of the test solution for twice the retention time of prilocaine. In the chromatogram obtained with the test solution, the area of any peak corresponding to *o*-toluidine is not greater than the area of the principal peak in the chromatogram obtained with the reference solution (100 ppm).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (2.5.12). Not more than 0.5 per cent, determined on 1.00 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.400 g in 20 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 22.03 mg of $C_{13}H_{20}N_2O$.

IMPURITIES

A. R = Cl: (*RS*)-2-chloro-*N*-(2-methylphenyl)propanamide,

C. R = $NH-C_2H_5$: (*RS*)-2-(ethylamino)-*N*-(2-methylphenyl)propanamide,

B. 2-methylbenzenamine (*o*-toluidine),

D. R = CH_3 , R' = H: (*RS*)-*N*-(3-methylphenyl)-2-(propylamino)propanamide,

E. R = H, R' = CH_3 : (*RS*)-*N*-(4-methylphenyl)-2-(propylamino)propanamide,

F. R = R' = H: (*RS*)-*N*-phenyl-2-(propylamino)propanamide.

01/2005:1363

PRILOCAINE HYDROCHLORIDE

Prilocaini hydrochloridum

 $C_{13}H_{21}ClN_2O$ M_r 256.8

DEFINITION

Prilocaine hydrochloride contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (*RS*)-*N*-(2-methylphenyl)-2-(propylamino)propanamide hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder or colourless crystals, freely soluble in water and in alcohol, very slightly soluble in acetone.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

- A. Melting point (2.2.14): 168 °C to 171 °C.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *prilocaine hydrochloride CRS*. Examine the substances prepared as discs.
- C. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel GF₂₅₄ plate R*.

Test solution. Dissolve 20.0 mg of the substance to be examined in *alcohol R* and dilute to 5 ml with the same solvent.

Reference solution (a). Dissolve 20.0 mg of *prilocaine hydrochloride CRS* in *alcohol R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dissolve 20.0 mg of *prilocaine hydrochloride CRS* and 20.0 mg of *lidocaine hydrochloride CRS* in *alcohol R* and dilute to 5 ml with the same solvent.

Apply to the plate 10 µl of each solution. Develop over a path of 12 cm, using a mixture of 1 volume of *concentrated ammonia R*, 5 volumes of *methanol R* and 100 volumes of *ether R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

- D. It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 2.50 g in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Optical rotation (2.2.7). The angle of optical rotation, determined on solution S, is -0.10° to $+0.10^\circ$.

Acidity or alkalinity. Dilute 4 ml of solution S to 10 ml with *carbon dioxide-free water R*. Add 0.1 ml of *bromocresol green solution R* and 0.40 ml of 0.01 M *sodium hydroxide*. The solution is blue. Add 0.80 ml of 0.01 M *hydrochloric acid*. The solution is yellow.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 30.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 3.0 mg of the substance to be examined and 3.0 mg of *prilocaine impurity E CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.125 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 40 volumes of *acetonitrile R* and 60 volumes of a solution prepared as follows: dissolve 0.180 g of *sodium dihydrogen phosphate monohydrate R* and 2.89 g of *disodium hydrogen phosphate dihydrate R* in 1000 ml of *water R* (pH 8.0),
- as detector a spectrophotometer set at 240 nm.

Inject 20 µl of reference solution (a). Adjust the sensitivity of the system so that the heights of the two principal peaks in the chromatogram obtained are at least 20 per cent of the full scale of the recorder. The test is not valid unless the resolution between the peaks corresponding to impurity E and prilocaine is at least 3.0. Inject 20 µl of the test solution and 20 µl of reference solution (b). Continue the chromatography of the test solution for twice the retention time of prilocaine, which is about 7 min. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and not more than one such peak has an area greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than five times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Disregard any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b).

***o*-Toluidine.** Use *freshly prepared solutions*. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution. Dissolve 10.0 mg of *o*-toluidine hydrochloride *R* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Carry out the chromatography using the same system as described under Related substances. Inject 20 µl of the reference solution. Adjust the sensitivity of the system so that the height of the peak in the chromatogram obtained is at least 50 per cent of the full scale of the recorder. Inject 20 µl of the test solution. Continue the chromatography of

the test solution for twice the retention time of prilocaine. In the chromatogram obtained with the test solution, the area of any peak corresponding to *o*-toluidine is not greater than the area of the principal peak in the chromatogram obtained with the reference solution (100 ppm).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) R.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.400 g in a mixture of 5.0 ml of 0.01 M *hydrochloric acid* and 50 ml of *alcohol* R. Carry out a potentiometric titration (2.2.20), using 0.1 M *sodium hydroxide*. Read the volume added between the two points of inflexion.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 25.68 mg of C₁₃H₂₁ClN₂O.

IMPURITIES

A. R = Cl: (RS)-2-chloro-*N*-(2-methylphenyl)propanamide,

C. R = NH-C₂H₅: (RS)-2-ethylamino-*N*-(2-methylphenyl)propanamide,

B. 2-methylbenzenamine (*o*-toluidine),

D. R = CH₃, R' = H: (RS)-*N*-(3-methylphenyl)-2-(propylamino)propanamide,

E. R = H, R' = CH₃: (RS)-*N*-(4-methylphenyl)-2-(propylamino)propanamide,

F. R = R' = H: (RS)-*N*-phenyl-2-(propylamino)propanamide.

PRIMAQUINE DIPHOSPHATE

Primaquini diphosphas

C₁₅H₂₇N₃O₉P₂

M_r 455.3

DEFINITION

Primaquine diphosphate contains not less than 98.5 per cent and not more than the equivalent of 101.5 per cent of (4*RS*)-*N*-(6-methoxyquinolin-8-yl)pentane-1,4-diamine bisphosphate, calculated with reference to the dried substance.

CHARACTERS

An orange, crystalline powder, soluble in water, practically insoluble in alcohol.

It melts at about 200 °C, with decomposition.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. Dissolve 15 mg in 0.01 M *hydrochloric acid* and dilute to 100.0 ml with the same acid. Examined between 310 nm and 450 nm (2.2.25), the solution shows two absorption maxima, at 332 nm and 415 nm. The specific absorbances at the maxima are 45 to 52 and 27 to 35, respectively. Dilute 5.0 ml of the solution to 50.0 ml with 0.01 M *hydrochloric acid*. Examined between 215 nm and 310 nm, the solution shows three absorption maxima, at 225 nm, 265 nm and 282 nm. The specific absorbances at the maxima are 495 to 515, 335 to 350 and 330 to 345, respectively.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *primaquine diphosphate CRS*. Examine the substances as discs prepared as follows: dissolve separately 0.1 g of the substance to be examined and 0.1 g of the reference substance in 5 ml of *water* R, add 2 ml of *dilute ammonia R2* and 5 ml of *methylene chloride R* and shake; dry the methylene chloride layer over 0.5 g of *anhydrous sodium sulphate R*; prepare a blank disc using about 0.3 g of *potassium bromide R*; apply dropwise to the disc 0.1 ml of the methylene chloride layer, allowing the methylene chloride to evaporate between applications; dry the disc at 50 °C for 2 min.

C. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel GF₂₅₄ plate R*.

Carry out all operations as rapidly as possible, protected from light. Prepare the test and reference solutions immediately before use.

Test solution. Dissolve 0.20 g of the substance to be examined in 5 ml of *water* R and dilute to 10 ml with *methanol* R. Dilute 1 ml of the solution to 10 ml with a mixture of equal volumes of *methanol* R and *water* R.

Reference solution. Dissolve 20 mg of *primaquine diphosphate CRS* in 5 ml of *water* R and dilute to 10 ml with *methanol* R.

Carry out pre-washing of the plate with a mixture of 1 volume of *concentrated ammonia R*, 40 volumes of *methanol* R and 60 volumes of *methylene chloride R*. Allow the plate to dry in air. Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using the mixture of solvents prescribed for pre-washing. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

D. Dissolve 50 mg in 5 ml of *water* R. Add 2 ml of *dilute sodium hydroxide solution R* and shake with two quantities, each of 5 ml, of *methylene chloride R*. The aqueous layer, acidified by addition of *nitric acid R*, gives reaction (b) of phosphates (2.3.1).

TESTS

01/2005:0584

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 50 mg of the substance to be examined in *water R* and dilute to 5.0 ml with the same solvent. To 1.0 ml of the solution add 0.2 ml of *concentrated ammonia R* and shake with 10.0 ml of the mobile phase. Use the clear lower layer.

Reference solution (a). Dissolve 50 mg of *primaquine diphosphate CRS* in *water R* and dilute to 5.0 ml with the same solvent. To 1.0 ml of the solution add 0.2 ml of *concentrated ammonia R* and shake with 10.0 ml of the mobile phase. Use the clear lower layer.

Reference solution (b). Dilute 3.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 50.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a column 0.2 m long and 4.6 mm in internal diameter packed with *silica gel for chromatography R* (10 µm),
- as mobile phase at a flow rate of 3.0 ml/min a mixture of 0.1 volumes of *concentrated ammonia R*, 10 volumes of *methanol R*, 45 volumes of *methylene chloride R* and 45 volumes of *hexane R*,
- as detector a spectrophotometer set at 261 nm,
- a loop injector.

Inject 20 µl of each solution and continue the chromatography for at least twice the retention time of primaquine. The test is not valid unless in the chromatogram obtained with reference solution (a), just before the principal peak there is a peak whose area is about 6 per cent of that of the principal peak and the resolution between these peaks is not less than 2.0; in the chromatogram obtained with reference solution (c) the signal-to-noise ratio of the principal peak is not less than five. In the chromatogram obtained with the test solution, the sum of the areas of any peaks, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent). Disregard the peak due to the solvent and any peak whose area is less than that of the principal peak in the chromatogram obtained with reference solution (c).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

ASSAY

Dissolve 0.2000 g in 40 ml of *anhydrous acetic acid R*, heating gently. Allow to cool and titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 22.77 mg of $C_{15}H_{27}N_3O_9P_2$.

STORAGE

Store protected from light.

PRIMIDONE

Primidonum

 $C_{12}H_{14}N_2O_2$
 M_r 218.3

DEFINITION

5-Ethyl-5-phenyldihydropyrimidine-4,6(1*H*,5*H*)-dione.

Content: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: very slightly soluble in water, slightly soluble in ethanol (96 per cent). It dissolves in alkaline solutions.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

- Use the solution prescribed for the assay. Examined between 240 nm and 300 nm (2.2.25), the solution shows 3 absorption maxima, at 252 nm, 257 nm and 264 nm, and 2 absorption minima, at 254 nm and 261 nm. The ratio of the absorbance measured at the absorption maximum at 257 nm to that measured at the absorption minimum at 261 nm is 2.00 to 2.20. The identification is valid if, in the test for resolution (2.2.25), the ratio of the absorbances is not less than 2.0.
- Infrared absorption spectrophotometry (2.2.24).
Preparation: discs of *potassium bromide R*.
Comparison: *primidone CRS*.
- Dissolve 0.1 g in 5 ml of a 5 g/l solution of *chromotropic acid, sodium salt R* in a mixture of 4 volumes of *water R* and 9 volumes of *sulphuric acid R*. A pinkish-blue colour develops on heating.
- Mix 0.2 g and 0.2 g of *anhydrous sodium carbonate R*. Heat until the mixture melts. Ammonia is evolved which is detectable by its alkaline reaction (2.2.4).

TESTS

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in *methanol R1* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol R1*. Dilute 1.0 ml of this solution to 10.0 ml with *methanol R1*.

Reference solution (b). Dissolve 5 mg of *primidone for peak identification CRS* (containing impurities A, B, C, D, E and F) in *methanol R1* and dilute to 5 ml with the same solvent.

Column:

- **size:** $l = 0.10$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** *monolithic octadecylsilyl silica gel for chromatography R*.

Mobile phase:

- **mobile phase A:** 1.36 g/l solution of *potassium dihydrogen phosphate R*,

– mobile phase B: methanol R1,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 1	75	25
1 - 6	75 → 40	25 → 60
6 - 8	40	60
8 - 8.5	40 → 75	60 → 25
8.5 - 10	75	25

Flow rate: 3.2 ml/min.

Detection: spectrophotometer at 215 nm.

Injection: 10 µl.

Identification of impurities: use the chromatogram supplied with *primidone* for peak identification CRS and the chromatogram obtained with reference solution (b) to identify the peaks.

Relative retention with reference to primidone (retention time = about 2.2 min): impurity A = about 0.5; impurity B = about 1.4; impurity C = about 1.6; impurity D = about 1.75; impurity E = about 2.0; impurity F = about 2.8.

System suitability: reference solution (b):

- resolution: minimum 2.5 between the peaks due to impurity B and impurity C.

Limits:

- correction factors: for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 1.5; impurity C = 1.5; impurity D = 1.4; impurity E = 1.3;
- impurity F: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent);
- impurities A, B, C, D, E: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
- any other impurity: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
- total: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);
- disregard limit: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.4.8): maximum 10 ppm.

2.0 g complies with limit test D. Prepare the reference solution using 2 ml of *lead standard solution* (10 ppm Pb) R.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C for 2 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 60.0 mg with heating in 70 ml of *ethanol* (96 per cent) R, cool and dilute to 100.0 ml with the same solvent. Prepare a reference solution in the same manner using 60.0 mg of *primidone* CRS. Measure the absorbance (2.2.25) of the 2 solutions at the absorption maximum at 257 nm.

Calculate the content of C₁₂H₁₄N₂O₂ from the absorbances measured and the concentrations of the solutions.

IMPURITIES

Specified impurities: A, B, C, D, E, F.

A. R1 = NH₂, R2 = CO-NH₂: 2-ethyl-2-phenylpropanediamide (ethylphenylmalonamide),

C. R1 = NH₂, R2 = H: (2*RS*)-2-phenylbutanamide,

D. R1 = NH₂, R2 = CN: (2*RS*)-2-cyano-2-phenylbutanamide,

E. R1 = OH, R2 = H: (2*RS*)-2-phenylbutanoic acid,

B. phenobarbital,

F. 5-ethyl-5-phenyl-2-[(1*RS*)-1-phenylpropyl]dihydropyrimidine-4,6(1*H*,5*H*)-dione.

01/2005:1364

PRIMULA ROOT

Primulae radix

DEFINITION

Primula root consists of the whole or cut, dried rhizome and root of *Primula veris* L. or *P. elatior* (L.) Hill.

CHARACTERS

Primula root has a bitter taste.

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- The coarsely torose, greyish-brown rhizome is straight or slightly curved, about 1 cm to 5 cm long and about 2 mm to 4 mm thick. The rhizome crown often bears the remains of stems and leaves. Attached to the rhizome are numerous brittle roots, about 1 mm thick and usually 6 cm to 8 cm long. The root of *P. elatior* is light brown to reddish-brown, that of *P. veris* light yellow to yellowish-white. The fracture is smooth.
- Reduce to a powder (355). The powder is greyish-brown. Examine under a microscope, using *chloral hydrate solution* R. The powder shows fragments of parenchyma from the root bark, medulla and bark of the rhizome consisting of rounded cells with thickened and pitted walls; brownish fragments from the surface tissue showing root hairs; vessels with reticulate thickening. Yellowish-green groups of strongly pitted stone cells are characteristic of the presence of *P. elatior*. Examine under a microscope using a 50 per cent V/V solution of *glycerol* R. The powder shows single or compound starch grains of various size and shape.
- Use the chromatograms obtained in the test for *Vincetoxicum hirundinaria medicus* root. Spray the plate with *anisaldehyde solution* R. Heat at 100 °C to 105 °C for 5 min to 10 min. Examine in daylight. The main zone (aescin) in the chromatogram obtained with

the reference solution is bluish-violet and is situated near the boundary between the lower and middle thirds. The chromatogram obtained with the test solution shows one or two strong dark violet zones a little below the aescin zone in the chromatogram obtained with the reference solution; further pale violet, yellowish or brownish-green zones may be visible.

TESTS

Foreign matter (2.8.2). It complies with the test for foreign matter.

Vincetoxicum hirundinaria medicus root. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄* plate R.

Test solution. To 1.0 g of the powdered drug (500) add 10 ml of *alcohol* (70 per cent V/V) R and heat under a reflux condenser for 15 min. Cool and filter.

Reference solution. Dissolve 10 mg of *aescin* R in 1.0 ml of *alcohol* (70 per cent V/V) R.

Apply to the plate as bands 20 µl of each solution. Develop over a path of 12 cm using the upper phase of a mixture of 10 volumes of *glacial acetic acid* R, 40 volumes of *water* R and 50 volumes of *butanol* R. Allow the plate to dry in an oven at 100 °C to 105 °C. Examine in ultraviolet light at 254 nm. The chromatograms obtained with the reference solution and the test solution show a quenching zone (*aescin*) near the boundary between the lower and the middle thirds. Mark this zone. Examine in ultraviolet light at 365 nm. In the chromatogram obtained with the test solution no zones of light-blue or greenish fluorescence occur below the main zone of *aescin* in the chromatogram obtained with the reference solution.

Loss on drying (2.2.32). Not more than 10.0 per cent, determined on 1.000 g of powdered drug (355) by drying in an oven at 100 °C to 105 °C for 2 h.

Total ash (2.4.16). Not more than 9.0 per cent.

Ash insoluble in hydrochloric acid (2.8.1). Not more than 3.0 per cent.

STORAGE

Store protected from light.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D.

A. Melting point (2.2.14): 197 °C to 202 °C.

B. Dissolve 20 mg in a mixture of 1 volume of 0.1 M *hydrochloric acid* and 9 volumes of *alcohol* R and dilute to 100.0 ml with the same mixture of solvents. Dilute 5.0 ml of the solution to 100.0 ml with a mixture of 1 volume of 0.1 M *hydrochloric acid* and 9 volumes of *alcohol* R. Examined between 220 nm and 350 nm (2.2.25), the solution shows two absorption maxima, at 223 nm and 248 nm. The specific absorbance at the maximum at 248 nm is 310 to 350.

C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *probenecid CRS*.

D. Dissolve 0.2 g in the smallest necessary quantity of *dilute ammonia* R2 (about 0.6 ml). Add 3 ml of *silver nitrate solution* R2. A white precipitate is formed which dissolves in an excess of ammonia.

TESTS

Appearance of solution. Dissolve 1.0 g in 1 M *sodium hydroxide* and dilute to 10 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, *Method II*).

Acidity. To 2.0 g add 100 ml of *water* R and heat on a water-bath for 30 min. Make up to the original volume with *water* R, allow to cool to room temperature and filter. To 50 ml of the filtrate add 0.1 ml of *phenolphthalein solution* R. Not more than 0.5 ml of 0.1 M *sodium hydroxide* is required to change the colour of the indicator.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄* R as the coating substance.

Test solution. Dissolve 0.1 g of the substance to be examined in *acetone* R and dilute to 10 ml with the same solvent.

Reference solution. Dilute 0.5 ml of the test solution to 100 ml with *acetone* R.

Apply separately to the plate 20 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *glacial acetic acid* R, 15 volumes of *chloroform* R, 20 volumes of *di-isopropyl ether* R and 55 volumes of *toluene* R. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) R.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.00 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 50 ml of *alcohol* R, shaking and heating slightly if necessary. Titrate with 0.1 M *sodium hydroxide*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *sodium hydroxide* is equivalent to 28.54 mg of C₁₃H₁₉NO₄S.

01/2005:0243

PROBENECID

Probenecidum

C₁₃H₁₉NO₄SM_r 285.4

DEFINITION

Probenecid contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 4-(dipropylsulfamoyl)benzoic acid, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder or small crystals, practically insoluble in water, soluble in acetone, sparingly soluble in ethanol.

01/2005:0567

PROCAINAMIDE HYDROCHLORIDE

Procainamidi hydrochloridum

 $C_{13}H_{22}ClN_3O$ M_r 271.8**DEFINITION**

Procainamide hydrochloride contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of 4-amino-*N*-[2-(diethylamino)ethyl]benzamide hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or very slightly yellow, crystalline powder, hygroscopic, very soluble in water, freely soluble in alcohol, slightly soluble in acetone.

IDENTIFICATION

First identification: C, D.

Second identification: A, B, D, E.

- A. Melting point (2.2.14): 166 °C to 170 °C.
- B. Dissolve 10.0 mg in 0.1 *M* sodium hydroxide and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml of the solution to 100.0 ml with 0.1 *M* sodium hydroxide. Examined between 220 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 273 nm. The specific absorbance at the maximum is 580 to 610.
- C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with procainamide hydrochloride CRS.
- D. Dilute 1 ml of solution S to 5 ml with water *R*. The solution gives reaction (a) of chlorides (2.3.1).
- E. Dilute 1 ml of solution S (see Tests) to 2 ml with water *R*. 1 ml of this solution gives the reaction of primary aromatic amines (2.3.1).

TESTS

Solution S. Dissolve 2.5 g in carbon dioxide-free water *R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution B₆ (2.2.2, Method II).

pH (2.2.3). The pH of solution S is 5.6 to 6.3.

Related substances. Examine by thin-layer chromatography (2.2.27), using silica gel GF₂₅₄ *R* as the coating substance.

Test solution. Dissolve 0.10 g of the substance to be examined in alcohol *R* and dilute to 10 ml with the same solvent.

Reference solution. Dilute 1 ml of the test solution to 200 ml with alcohol *R*.

Apply to the plate 5 µl of each solution. Develop over a path of 12 cm using a mixture of 15 volumes of glacial acetic acid *R*, 30 volumes of water *R* and 60 volumes of butanol *R*. Place the plate in a stream of cold air until the plate appears dry. Examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from

the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of lead standard solution (10 ppm Pb) *R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.2500 g in 50 ml of dilute hydrochloric acid *R*. Carry out the determination of primary aromatic amino-nitrogen (2.5.8).

1 ml of 0.1 *M* sodium nitrite is equivalent to 27.18 mg of $C_{13}H_{22}ClN_3O$.

STORAGE

Store in an airtight container, protected from light.

01/2005:0050

PROCAINE HYDROCHLORIDE

Procaini hydrochloridum

 $C_{13}H_{21}ClN_2O_2$ M_r 272.8**DEFINITION**

Procaine hydrochloride contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 2-(diethylamino)ethyl 4-aminobenzoate hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder or colourless crystals, very soluble in water, soluble in alcohol.

IDENTIFICATION

First identification: A, B, E.

Second identification: A, C, D, E, F.

A. Melting point (2.2.14): 154 °C to 158 °C.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with procaine hydrochloride CRS.

C. To about 5 mg add 0.5 ml of fuming nitric acid *R*. Evaporate to dryness on a water-bath, allow to cool and dissolve the residue in 5 ml of acetone *R*. Add 1 ml of 0.1 *M* alcoholic potassium hydroxide. Only a brownish-red colour develops.

D. To 0.2 ml of solution S (see Tests) add 2 ml of water *R* and 0.5 ml of dilute sulphuric acid *R* and shake. Add 1 ml of a 1 g/l solution of potassium permanganate *R*. The colour is immediately discharged.

E. It gives reaction (a) of chlorides (2.3.1).

F. Dilute 1 ml of solution S to 100 ml with water *R*. 2 ml of this solution gives the reaction of primary aromatic amines (2.3.1).

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). Dilute 4 ml of solution S to 10 ml with *carbon dioxide-free water R*. The pH of the solution is 5.0 to 6.5.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 1.0 g of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 50 mg of 4-aminobenzoic acid *R* in *water R* and dilute to 100 ml with the same solvent. Dilute 1 ml of the solution to 10 ml with *water R*.

Apply separately to the plate 5 µl of each solution. Develop over a path of 10 cm using a mixture of 4 volumes of *glacial acetic acid R*, 16 volumes of *hexane R* and 80 volumes of *dibutyl ether R*. Dry the plate at 100 °C to 105 °C for 10 min and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.05 per cent). The principal spot in the chromatogram obtained with the test solution remains on the starting point.

Heavy metals (2.4.8). Dissolve 1.0 g in *water R* and dilute to 25.0 ml with the same solvent. Carry out the prefiltration. 10 ml of the prefiltrate complies with limit test E for heavy metals (5 ppm). Prepare the standard using 2 ml of *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.00 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.400 g in 50 ml of *dilute hydrochloric acid R*. Carry out the determination of primary aromatic amino nitrogen (2.5.8).

1 ml of 0.1 M *sodium nitrite* is equivalent to 27.28 mg of C₁₃H₂₁ClN₃O₂.

STORAGE

Store protected from light.

DEFINITION

Prochlorperazine maleate contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of 2-chloro-10-[3-(4-methylpiperazin-1-yl)propyl]-10*H*-phenothiazine bis[hydrogen (*Z*)-butenedioate], calculated with reference to the dried substance.

CHARACTERS

A white or pale-yellow, crystalline powder, very slightly soluble in water and in alcohol.

IDENTIFICATION

First identification: B, C, D.

Second identification: A, C, D.

- A. Carry out the test protected from light. Dissolve 50 mg in 0.1 M *hydrochloric acid* and dilute to 500.0 ml with the same acid. Examined immediately between 280 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 305 nm. Dilute 10.0 ml of the solution to 100.0 ml with 0.1 M *hydrochloric acid*. Examined immediately between 230 nm and 280 nm, the solution shows an absorption maximum at 255 nm. The specific absorbance at the maximum is 525 to 575.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *prochlorperazine maleate CRS*.
- C. It complies with the identification of phenothiazines by thin-layer chromatography (2.3.3), with the following modifications:
Test solution. Dissolve 20 mg of the substance to be examined in a mixture of equal volumes of *chloroform R* and *methanol R* and dilute to 20 ml with the same mixture of solvents.
Reference solution. Dissolve 20 mg of *prochlorperazine maleate CRS* in a mixture of equal volumes of *chloroform R* and *methanol R* and dilute to 20 ml with the same mixture of solvents.
 Apply separately to the plate 4 µl of each solution.
- D. Triturate 0.2 g with a mixture of 1 ml of *strong sodium hydroxide solution R* and 3 ml of *water R*. Shake with three quantities, each of 5 ml, of *ether R*. To 0.1 ml of the aqueous layer add a solution of 10 mg of *resorcinol R* in 3 ml of *sulphuric acid R*. Heat in a water-bath for 15 min. No colour develops. To the remainder of the aqueous layer add 2 ml of *bromine solution R*. Heat in a water-bath for 15 min and then heat to boiling. Cool. To 0.1 ml of the solution add a solution of 10 mg of *resorcinol R* in 3 ml of *sulphuric acid R*. Heat in a water-bath for 15 min. A blue colour develops.

TESTS

pH (2.2.3). The pH of a freshly prepared saturated solution in *carbon dioxide-free water R* is 3.0 to 4.0.

Related substances. Carry out the test protected from light. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 0.2 g of the substance to be examined in a mixture of 5 volumes of *diethylamine R* and 95 volumes of *methanol R* and dilute to 10 ml with the same mixture of solvents. Prepare immediately before use.

Reference solution. Dilute 1 ml of the test solution to 200 ml with a mixture of 5 volumes of *diethylamine R* and 95 volumes of *methanol R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 12 cm using a mixture of 10 volumes of *acetone R*, 10 volumes of *diethylamine R* and 80 volumes of *cyclohexane R*. Allow the plate to dry in air and examine in

01/2005:0244

PROCHLORPERAZINE MALEATE

Prochlorperazini maleas

C₂₈H₃₂ClN₃O₈SM_r 606

ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent). Disregard any spots remaining at the starting-points.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.00 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g of the powdered substance to be examined in 50 ml of *anhydrous acetic acid R*, warming on a water-bath. Allow to cool to room temperature. Titrate with 0.1 M *perchloric acid* determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 30.31 mg of $C_{21}H_{30}O_2$.

STORAGE

Store protected from light.

01/2005:0429

PROGESTERONE

Progesteronum

$C_{21}H_{30}O_2$

M_r 314.5

DEFINITION

Pregn-4-ene-3,20-dione.

Content: 97.0 per cent to 103.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless crystals.

Solubility: practically insoluble in water, freely soluble in ethanol, sparingly soluble in acetone and in fatty oils.

It shows polymorphism.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: *progesterone CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *ethanol R*, evaporate to dryness and record new spectra using the residues.

B. Thin-layer chromatography (2.2.27)

Test solution. Dissolve 10 mg of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution. Dissolve 10 mg of *progesterone CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Plate: *TLC silica gel F₂₅₄ plate R*.

Mobile phase: *ethyl acetate R, methylene chloride R* (33:66 V/V).

Application: 5 µl.

Development: over 3/4 of the plate.

Drying: in air.

Detection A: examine in ultraviolet light at 254 nm.

Detection B: spray with *alcoholic solution of sulphuric acid R*, heat at 120 °C for 15 min and allow to cool. Examine in daylight and in ultraviolet light at 365 nm.

Results A: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

Results B: the principal spot in the chromatogram obtained with the test solution is similar in position, fluorescence in ultraviolet light at 365 nm and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Specific optical rotation (2.2.7): + 186 to + 194 (dried substance).

Dissolve 0.250 g in *ethanol R* and dilute to 25.0 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 20.0 mg of the substance to be examined in *methanol R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dissolve 2.0 mg of *progesterone CRS* and 2.0 mg of *progesterone impurity C CRS* in *methanol R* and dilute to 50.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol R*.

Column:

- **size:** $l = 0.15$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** spherical *end-capped octadecylsilyl silica gel for chromatography R* (5 µm).

Mobile phase:

- **mobile phase A:** *water R*,
- **mobile phase B:** *acetonitrile R*.

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 20	50	50
20 - 27	50 → 20	50 → 80
27 - 45	20	80
45 - 50	50	50

Flow rate: 0.8 ml/min.

Detection: spectrophotometer at 241 nm.

Injection: 10 µl.

System suitability: reference solution (a):

- **resolution:** minimum 1.5 between the peaks due to impurity C and to progesterone.

Limits:

- **any impurity:** not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
- **total:** not more than 0.8 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.8 per cent),

- *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 0.500 g by drying in an oven at 100–105 °C for 2 h.

ASSAY

Dissolve 25.0 mg in *alcohol R* and dilute to 250.0 ml with the same solvent. Dilute 5.0 ml of the solution to 50.0 ml with *alcohol R*. Measure the absorbance (2.2.25) at the maximum at 241 nm.

Calculate the content of $C_{21}H_{30}O_2$ taking the specific absorbance to be 535.

STORAGE

Protected from light.

IMPURITIES

A. pregna-4,14-diene-3,20-dione,

B. R = OH, R' = H: (20S)-20-hydroxypregn-4-en-3-one,

01/2005:2002

PROGUANIL HYDROCHLORIDE

Proguanili hydrochloridum

$C_{11}H_{17}Cl_2N_5$

M_r 290.2

DEFINITION

1-(4-Chlorophenyl)-5-(1-methylethyl)biguanide hydrochloride.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white, crystalline powder.

Solubility: slightly soluble in water, sparingly soluble in ethanol, practically insoluble in methylene chloride.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of proguanil hydrochloride.

B. Dissolve 0.4 g in 50 ml of *water R* (solution A). To 15 ml of solution A add 2 ml of *dilute sodium hydroxide solution R*. Extract with 20 ml of *ethyl acetate R*. Wash the organic layer with *water R*, evaporate to dryness and dry at 105 °C. The melting point (2.2.14) of the residue is 130 °C to 133 °C.

C. To 10 ml of solution A, add 1 drop of *copper sulphate solution R* and 2 ml of *dilute ammonia R1*. Add 5 ml of *toluene R* and stir. Allow to stand until separation of the layers is obtained. The upper layer is violet-red.

D. It gives reaction (a) of chlorides (2.3.1).

TESTS

Acidity or alkalinity. To 35 ml of *water R* maintained at 60–65 °C, add 0.2 ml of *methyl red mixed solution R*. Neutralise to a grey colour with either 0.01 M *sodium hydroxide* or 0.01 M *hydrochloric acid*. Add 0.4 g of the substance to be examined and stir until completely dissolved. The solution is grey or green. Not more than 0.2 ml of 0.01 M *hydrochloric acid* is required to change the colour of the solution to reddish-violet.

Chloroaniline: maximum 250 ppm.

Dissolve 0.10 g in 1 ml of 2 M *hydrochloric acid* and dilute to 20 ml with *water R*. Cool to 5 °C. Add 1 ml of a 3.45 g/l solution of *sodium nitrite R* and allow to stand at 5 °C for 5 min. Add 2 ml of a 50 g/l solution of *ammonium sulphamate R* and allow to stand for 10 min. Add 2 ml of *naphthylethylenediamine dihydrochloride solution R*, dilute to 50 ml with *water R* and allow to stand for 30 min. Any red colour produced is not more intense than that of a standard prepared at the same time and in the same manner, using 20 ml of a 1.25 mg/l solution of *chloroaniline R*.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 10.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of *proguanil impurity C CRS* in the mobile phase and dilute to 100 ml with the mobile phase. Dilute 0.1 ml to 10 ml with the mobile phase.

Reference solution (c). Dissolve 5 mg of *proguanil impurity D CRS* in the mobile phase and dilute to 100 ml with the mobile phase. Dilute 0.1 ml to 10 ml with the mobile phase.

Reference solution (d). Dilute 1 ml of the test solution to 200 ml with the mobile phase. To 1 ml add 1 ml of reference solution (c) and mix.

Column:

- **size:** $l = 0.125$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** octadecylsilyl silica gel for chromatography *R* (5 μ m).

Mobile phase: dissolve 3.78 g of sodium hexanesulphonate *R* in a mixture of 10 volumes of *glacial acetic acid R*, 800 volumes of *water R* and 1200 volumes of *methanol R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 230 nm and 254 nm.

Injection: 20 μ l.

Run time: 5 times the retention time of proguanil.

Retention time: proguanil = about 6 min.

System suitability: reference solution (d) at 230 nm:

- **resolution:** minimum 5 between the peaks due to impurity D and proguanil.

Limits:

- **impurity C:** not more than 3.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) at 230 nm (0.7 per cent),
- **impurity D:** not more than the area of the principal peak in the chromatogram obtained with reference solution (a) at 230 nm (0.2 per cent),
- **any other impurity:** not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) at 230 nm and at 254 nm (0.1 per cent),
- **total:** the sum of the calculated percentage contents of known and unknown impurities is not greater than 1 per cent, considering each peak at the wavelength at which the peak shows the higher value,
- **disregard limit:** 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Suspend 0.100 g in 20 ml of *anhydrous acetic acid R*, shake and heat at 50 °C for 5 min. Cool to room temperature and add 40 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 14.51 mg of $C_{11}H_{17}Cl_2N_5$.

STORAGE

Protected from light.

IMPURITIES

A. 1-cyano-3-(1-methylethyl)guanidine,

B. 4-chloroaniline,

C. 1,5-bis(4-chlorophenyl)biguanide,

D. 1,5-bis(1-methylethyl)biguanide.

01/2005:0785

PROLINE

Prolinum

$C_5H_9NO_2$

M_r 115.1

DEFINITION

Proline contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (*S*)-pyrrolidine-2-carboxylic acid, calculated with reference to the dried substance.

CHARACTERS

White or almost white, crystalline powder or colourless crystals, very soluble in water, freely soluble in alcohol.

IDENTIFICATION

First identification: A, B.

Second identification: A, C.

- It complies with the test for specific optical rotation (see Tests).
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *proline CRS*. Examine the substances prepared as discs.
- Examine the chromatograms obtained in the test for ninhydrin-positive substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

Solution S. Dissolve 2.5 g in *distilled water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Specific optical rotation (2.2.7). Dissolve 1.00 g in *water R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is -84.0 to -86.0 , calculated with reference to the dried substance.

Ninhydrin-positive substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution (a). Dissolve 0.10 g of the substance to be examined in *0.1 M hydrochloric acid* and dilute to 10 ml with the same acid.

Test solution (b). Dilute 1 ml of test solution (a) to 50 ml with *water R*.

Reference solution (a). Dissolve 10 mg of *proline CRS* in *0.1 M hydrochloric acid* and dilute to 50 ml with the same acid.

Reference solution (b). Dilute 5 ml of test solution (b) to 20 ml with *water R*.

Reference solution (c). Dissolve 10 mg of *proline CRS* and 10 mg of *threonine CRS* in *0.1 M hydrochloric acid* and dilute to 25 ml with the same acid.

Apply to the plate 5 μ l of each solution. Allow the plate to dry in air. Develop over a path of 15 cm using a mixture of 20 volumes of *glacial acetic acid R*, 20 volumes of *water R* and 60 volumes of *butanol R*. Allow the plate to dry in air, spray with *ninhydrin solution R* and heat at $100\text{ }^{\circ}\text{C}$ to $105\text{ }^{\circ}\text{C}$ for 15 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Chlorides (2.4.4). Dilute 5 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides (200 ppm).

Sulphates (2.4.13). Dilute 10 ml of solution S to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (300 ppm).

Ammonium (2.4.1). 50 mg complies with limit test B for ammonium (200 ppm). Prepare the standard using 0.1 ml of *ammonium standard solution (100 ppm NH_4) R*.

Iron (2.4.9). In a separating funnel, dissolve 1.0 g in 10 ml of *dilute hydrochloric acid R*. Shake with three quantities, each of 10 ml, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers add 10 ml of *water R* and shake for 3 min. The aqueous layer complies with the limit test for iron (10 ppm).

Heavy metals (2.4.8). Dissolve 2.0 g in *water R* and dilute to 20 ml with the same solvent. 12 ml of the solution complies with limit test A for heavy metals (10 ppm). Prepare the standard using the *lead solution (1 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at $100\text{ }^{\circ}\text{C}$ to $105\text{ }^{\circ}\text{C}$.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in 3 ml of *anhydrous formic acid R*. Add 30 ml of *anhydrous acetic acid R*. Titrate with *0.1 M perchloric acid* using 0.1 ml of *naphtholbenzein solution R* as indicator, until the colour changes from brownish-yellow to green.

1 ml of *0.1 M perchloric acid* is equivalent to 11.51 mg of $\text{C}_{17}\text{H}_{21}\text{ClN}_2\text{S}$.

STORAGE

Store protected from light.

01/2005:1365

PROMAZINE HYDROCHLORIDE

Promazini hydrochloridum

$\text{C}_{17}\text{H}_{21}\text{ClN}_2\text{S}$

M_r 320.9

DEFINITION

Promazine hydrochloride contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 3-(10*H*-phenothiazin-10-yl)-*N,N*-dimethylpropan-1-amine hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, slightly hygroscopic, very soluble in water, in alcohol and in methylene chloride.

It melts at about $179\text{ }^{\circ}\text{C}$.

IDENTIFICATION

First identification: A, B, D.

Second identification: B, C, D.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *promazine hydrochloride CRS*.
- It complies with the identification test for phenothiazines by thin-layer chromatography (2.3.3). Use *promazine hydrochloride CRS* to prepare the reference solution.
- Dissolve about 5 mg in 2 ml of *sulphuric acid R* and allow to stand for 5 min. An orange colour is produced.
- It gives reaction (b) of chlorides (2.3.1).

TESTS

pH (2.2.3). Dissolve 0.5 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent. The pH of the freshly prepared solution is 4.2 to 5.2.

Related substances. Carry out the test protected from bright light. Prepare the solutions immediately before use.

Examine by thin layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*.

Test solution. Dissolve 0.10 g of the substance to be examined in a mixture of 5 volumes of *diethylamine R* and 95 volumes of *methanol R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dilute 1 ml of the test solution to 200 ml with a mixture of 5 volumes of *diethylamine R* and 95 volumes of *methanol R*.

Reference solution (b). Dissolve 10 mg of *chlorprothixene hydrochloride CRS* in a mixture of 5 volumes of *diethylamine R* and 95 volumes of *methanol R*, add 1 ml of the test solution and dilute to 10 ml with the same mixture of solvents.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *acetone R*, 10 volumes of *diethylamine R* and 80 volumes of *cyclohexane R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (a) (0.5 per cent). Disregard any spot at the starting point. The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated principal spots.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in a mixture of 5.0 ml of 0.01 M *hydrochloric acid* and 50 ml of *alcohol R*. Carry out a potentiometric titration (2.2.20), using 0.1 M *sodium hydroxide*. Read the volume added between the two points of inflexion.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 32.09 mg of C₁₇H₂₁ClN₂S.

STORAGE

Store protected from light.

IMPURITIES

- A. 3-(10H-phenothiazin-10-yl)-N,N-dimethylpropan-1-amine S-oxide (promazine sulphoxide).

01/2005:0524

PROMETHAZINE HYDROCHLORIDE

Promethazini hydrochloridum

C₁₇H₂₁ClN₂S

M_r 320.9

DEFINITION

Promethazine hydrochloride contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (2*RS*)-N,N-dimethyl-1-(10H-phenothiazin-10-yl)propan-2-amine hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or faintly yellowish, crystalline powder, very soluble in water, freely soluble in alcohol and in methylene chloride.

It melts at about 222 °C, with decomposition.

IDENTIFICATION

First identification: A, B, D.

Second identification: B, C, D.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *promethazine hydrochloride CRS*.
- It complies with the identification test for phenothiazines by thin-layer chromatography (2.3.3).
- Dissolve 0.1 g in 3 ml of *water R*. Add dropwise 1 ml of *nitric acid R*. A precipitate is formed which rapidly dissolves to give a red solution, becoming orange and then yellow. Heat to boiling. The solution becomes orange and an orange-red precipitate is formed.
- It gives reaction (b) of chlorides (2.3.1).

TESTS

pH (2.2.3). Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent. The pH of the solution measured immediately after preparation is 4.0 to 5.0.

Related substances. Carry out the test protected from bright light. Prepare the solutions immediately before use. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution. Dissolve 0.20 g of the substance to be examined in a mixture of 5 volumes of *diethylamine R* and 95 volumes of *methanol R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dissolve 20 mg of *isopromethazine hydrochloride CRS* in a mixture of 5 volumes of *diethylamine R* and 95 volumes of *methanol R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dilute 0.5 ml of the test solution to 100 ml with a mixture of 5 volumes of *diethylamine R* and 95 volumes of *methanol R*.

Reference solution (c). Dilute 0.2 ml of the test solution to 100 ml with a mixture of 5 volumes of *diethylamine R* and 95 volumes of *methanol R*.

Apply separately to the plate 10 µl of the test solution and 10 µl of each reference solution. Develop in an unsaturated tank over a path of 12 cm using a mixture of 5 volumes of *diethylamine R*, 10 volumes of *acetone R* and 85 volumes of *cyclohexane R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Disregard any spot at the starting point.

In the chromatogram obtained with the test solution: any spot corresponding to isopromethazine hydrochloride is not more intense than the spot in the chromatogram obtained with reference solution (a) (1 per cent); any spot, apart from the principal spot and the spot corresponding to isopromethazine hydrochloride, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent) and at most three such spots are more intense than the spot in the chromatogram obtained with reference solution (c) (0.2 per cent).

Heavy metals (2.4.8). Dissolve 1.0 g in 5 ml of *water R*, add 5 ml of *acetone R* and 5 ml of *buffer solution pH 3.5 R*. Carry out the prefiltration. The prefiltrate complies with limit test E for heavy metals (10 ppm). Prepare the standard using 5 ml of *lead standard solution (2 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in a mixture of 5.0 ml of 0.01 M hydrochloric acid and 50 ml of alcohol R. Carry out a potentiometric titration (2.2.20), using 0.1 M sodium hydroxide. Read the volume added between the two points of inflexion.

1 ml of 0.1 M sodium hydroxide is equivalent to 32.09 mg of $C_{17}H_{21}ClN_2S$.

STORAGE

Store protected from light.

IMPURITIES

A. phenothiazine,

B. (2RS)-N,N-dimethyl-2-(10H-phenothiazin-10-yl)propan-1-amine (isopromethazine),

C. R = H, X = S: (2RS)-N-methyl-1-(10H-phenothiazin-10-yl)propan-2-amine,

D. R = CH₃, X = SO: (2RS)-N,N-dimethyl-1-(10H-phenothiazin-10-yl)propan-2-amine S-oxide.

01/2005:1366

PROPACETAMOL HYDROCHLORIDE

Propacetamoli hydrochloridum

$C_{14}H_{21}ClN_2O_3$

M_r 300.8

DEFINITION

Propacetamol hydrochloride contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of 4-(acetlamino)phenyl (diethylamino)acetate hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, freely soluble in water, slightly soluble in ethanol, practically insoluble in acetone.

IDENTIFICATION

A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the Ph. Eur. reference spectrum of propacetamol hydrochloride.

B. It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Prepare the solution immediately before use. Dissolve 1.75 g in water R and dilute to 10.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₆ or BY₆ (2.2.2, Method II).

Absorbance. The absorbance (2.2.25) of solution S measured at 390 nm is not greater than 0.05.

Related substances. Examine by liquid chromatography (2.2.29).

Solution A. Dissolve 2.16 g of sodium octanesulphonate R in 900 ml of water R and dilute to 1000 ml with the same solvent. Adjust to pH 3.0 with acetic acid R.

Test solution. Suspend 1.00 g of the substance to be examined in 10.0 ml of acetonitrile R. Shake for 10 min. Allow to stand. Take 3.0 ml of the supernatant solution and dilute to 10.0 ml with solution A. Inject this solution immediately after preparation.

Reference solution (a). Dissolve 50 mg of paracetamol R in acetonitrile R and dilute to 50.0 ml with the same solvent. Dilute 1.0 ml of the solution to 50.0 ml with acetonitrile R. Dilute 3.0 ml of the latter solution to 10.0 ml with solution A.

Reference solution (b). Dissolve 10 mg of paracetamol R and 0.100 g of 4-aminophenol R in acetonitrile R and dilute to 50.0 ml with the same solvent. Dilute 1.0 ml of the solution to 50.0 ml with acetonitrile R. Dilute 3.0 ml of the latter solution to 10.0 ml with solution A.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with octadecylsilyl silica gel for chromatography R (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 30 volumes of acetonitrile R and 70 volumes of solution A,
- as detector a spectrophotometer set at 246 nm.

Inject 20 µl of reference solution (b). The chromatogram obtained shows a peak corresponding to paracetamol (first peak) and a peak corresponding to 4-aminophenol (second peak) with a retention time relative to paracetamol of about 1.6. Adjust the sensitivity of the system so that the height of the two principal peaks is at least 20 per cent of the full scale of the recorder.

Inject 20 µl of the test solution and 20 µl of reference solution (a). Continue the chromatography of the test solution for twice the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak corresponding to paracetamol is not greater than that of the peak due to paracetamol in the chromatogram obtained with reference solution (a) (200 ppm); the area of any peak, apart from the principal peak and the peak due to paracetamol, is not greater than 3.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent taking into account the response factor of paracetamol of 1.6); the sum of the areas of any peak, apart from the principal peak, is not greater than 6.4 times the area of the paracetamol peak in the chromatogram obtained with reference solution (a) (0.2 per cent taking into account the relative response factor

of paracetamol of 1.6). Disregard any peak with an area less than 0.01 times the area of the principal peak in the chromatogram obtained with reference solution (a).

4-Aminophenol. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*.

Test solution. Suspend 4.00 g of the substance to be examined in 8 ml of *acetonitrile R*. Shake for 30 min and filter. Dilute to 10 ml with *acetonitrile R*.

Reference solution (a). Dissolve 25 mg of *4-aminophenol R* in *acetonitrile R* and dilute to 50 ml with the same solvent. Dilute 10 ml of the solution to 50 ml with *acetonitrile R*.

Reference solution (b). Dilute 5 ml of reference solution (a) to 50 ml with *acetonitrile R*.

Reference solution (c). Dilute 0.2 ml of reference solution (a) to 5 ml with the test solution.

Apply to the plate 50 µl of the test solution and 50 µl each of reference solutions (b) and (c). Develop over a path of 15 cm using a mixture of 3 volumes of *anhydrous formic acid R*, 4 volumes of *water R*, 30 volumes of *methanol R* and 64 volumes of *methylene chloride R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Spray with a 10 g/l solution of *dimethylaminobenzaldehyde R* in *alcohol R*. Reference solution (c) shows two spots: one visible in ultraviolet light and corresponding to propacetamol hydrochloride and the other one yellow, visible after spraying and corresponding to 4-aminophenol. An additional spot may appear in ultraviolet light and corresponds to paracetamol. In the chromatogram obtained with the test solution, any yellow spot corresponding to 4-aminophenol and not visible in ultraviolet light is not more intense than the spot in the chromatogram obtained with reference solution (b) (25 ppm). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Methanol. Examine by gas chromatography (2.2.28), using *propanol R* as the internal standard.

Internal standard solution. Dilute 2.0 ml of *propanol R* to 20.0 ml with *water R*. Dilute 1.0 ml of the solution to 25.0 ml with *water R*. Dilute 1.0 ml of this solution to 25.0 ml with *water R*.

Test solution. Dissolve 2.00 g of the substance to be examined in *water R*, add 2.0 ml of the internal standard solution and dilute to 10.0 ml with *water R*.

Reference solution. Dilute 0.8 ml of *methanol R* to 50.0 ml with *water R*. Dilute 1.0 ml of the solution to 25.0 ml with *water R*. To 2.0 ml of the solution, add 2.0 of the internal standard solution and dilute to 10.0 ml with *water R*.

The chromatographic procedure may be carried out using:

- a glass column 2 m long and 2 mm in internal diameter packed with carbon molecular sieve impregnated with 0.2 per cent of macrogol 1500,
- *nitrogen for chromatography R* as the carrier gas,
- a flame-ionisation detector,

with the following temperature programme:

	Time (min)	Temperature (°C)	Rate (°C/min)	Comment
Column	0 - 1.5	60	–	isothermal
	1.5 - 5.5	60 → 80	5	linear gradient
	5.5 - 15.5	80	–	isothermal
Injection port		170		
Detector		220		

Inject 2 µl of the test solution and 2 µl of the reference solution.

Calculate the ratio of the area of the peak due to methanol to the area of the peak due to propanol for both chromatograms. The ratio for the test solution is not greater than that for the reference solution (500 ppm).

Heavy metals (2.4.8). Dissolve 2.0 g in *water R* and dilute to 20 ml with the same solvent. 12 ml of the solution complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution 1 ppm (Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 3 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in a mixture of 25 ml of *anhydrous acetic acid R* and 25 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 30.08 mg of C₁₄H₂₁ClN₂O₃.

STORAGE

Store protected from humidity.

IMPURITIES

A. paracetamol,

B. 4-aminophenol.

01/2005:2036
corrected

PROPANOL

Propanolum

C₃H₈O

M_r 60.1

DEFINITION

Propan-1-ol.

CHARACTERS

Appearance: clear, colourless liquid.

Solubility: miscible with water and with ethanol.

IDENTIFICATION

First identification: C, B.

Second identification: A, B, D.

A. Refractive index (2.2.6): 1.384 to 1.387.

B. Boiling point (2.2.12): 96 °C to 98 °C.

C. Infrared absorption spectrophotometry (2.2.24).

Comparison: *Ph. Eur. reference spectrum of propanol.*

D. To 1.0 ml add 0.10 g of *dinitrobenzoyl chloride R* and 0.05 ml of *sulphuric acid R*. Boil under reflux for 30 min. Evaporate until the excess of propanol is removed, add 5 ml of *heptane R* to the residue and heat to boiling. Filter the hot solution. Wash the crystals formed on cooling with *heptane R* and dry in vacuum (2 kPa, at room temperature for 24 h). The small, colourless, shiny plates melt (2.2.14) between 71 °C and 74 °C.

TESTS

Solution S. Dissolve the residue obtained in the test for non-volatile matter in 1 ml of 1 M hydrochloric acid and dilute to 50.0 ml with water R.

Appearance. The substance to be examined is clear (2.2.1) and colourless (2.2.2, Method II). Dilute 2 ml to 10 ml with water R. After 5 min, the solution is clear (2.2.1).

Acidity or alkalinity. To 10.0 ml of carbon dioxide-free water R add 0.1 ml of phenolphthalein solution R and 0.01 M sodium hydroxide until the solution becomes pale pink. After addition of 5.0 ml of the substance to be examined the colour of the solution does not become more intense. If the colour fades, add 0.2 ml of 0.01 M sodium hydroxide. The solution is pink.

Absorbance (2.2.25). Measure the absorbance between 230 nm and 310 nm using water R as the compensation liquid. The absorbance *A* is not greater than the following values.

Wavelength (nm)	Absorbance <i>A</i>
230	0.300
250	0.100
270	0.030
290	0.020
310	0.010

The absorption curve does not show any peaks.

Reducing substances. Place 10.0 ml in a test tube of about 20 mm in diameter in a water bath at 20 °C. Keep protected from actinic light and add 1.0 ml of a freshly prepared 0.16 g/l solution of potassium permanganate R. The mixture, maintained at 20 °C, slowly changes its colour from violet to red. After 30 min, the test solution is not less intensely coloured (2.2.2, Method II) than 10.0 ml of a reference solution prepared as follows: to 5.5 ml of primary solution yellow, add 13.0 ml of primary solution red and dilute to 100.0 ml with water R.

Related substances. Gas chromatography (2.2.28).

Test solution. The substance to be examined.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with heptane R. Dilute 1.0 ml of the solution to 10.0 ml with heptane R.

Reference solution (b). Mix 0.1 ml of acetone R with 0.1 ml of 2-propanol R and dilute to 100 ml with the test solution.

Column:

- **material:** fused silica,
- **size:** *l* = 30 m, Ø = 0.25 mm,
- **stationary phase:** poly[(cyanopropyl)(phenyl)][dimethylsiloxane R (film thickness 1.4 µm).

Carrier gas: helium for chromatography R.

Linear velocity: 25 cm/s.

Split ratio: 1:200.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 12	40
	12 - 28	40 → 200
	28 - 38	200
Injection port		240
Detector		240

Detection: flame ionisation.

Injection: 1 µl.

System suitability: reference solution (b):

- **resolution:** minimum 2.0 between the peaks due to impurity D and impurity E.

Limits:

- **any impurity:** not more than the area of the peak due to propanol in the chromatogram obtained with reference solution (a) (0.1 per cent),
- **total:** not more than 3 times the area of the peak due to propanol in the chromatogram obtained with reference solution (a) (0.3 per cent),
- **disregard limit:** 0.1 times the area of the peak due to propanol in the chromatogram obtained with reference solution (a) (0.01 per cent).

Non-volatile matter: maximum 0.004 per cent.

Evaporate 50 ml of the substance to be examined to dryness at 100 °C and dry the residue in an oven at 100-105 °C to constant mass. The residue weighs a maximum of 2 mg. The residue is used for the preparation of solution S.

Water (2.5.12): maximum 0.2 per cent, determined on 10 g.

STORAGE

Protected from light.

IMPURITIES

- A. CH₃-OH: methanol,
 B. ethanol,
 C. CH₃-CH₂-CHO: propanal,
 D. acetone,
 E. isopropyl alcohol (2-propanol),

- F. butan-2-ol (sec-butanol),

- G. 2-methylpropan-1-ol (isobutanol),
 H. CH₃-[CH₂]₃-OH: butan-1-ol (*n*-butanol),
 I. CH₃-[CH₂]₄-OH: pentan-1-ol (*n*-pentanol),
 J. CH₃-[CH₂]₅-OH: hexan-1-ol (*n*-hexanol).

01/2005:0857

PROPANTHELINE BROMIDE

Propanthelini bromidum

C₂₃H₃₀BrNO₃

*M*_r 448.4

DEFINITION

Propantheline bromide contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of *N*-methyl-*N*,*N*-bis(1-methylethyl)-2-[(9*H*-xanthen-9-ylcarbonyl)oxy]ethanaminium bromide, calculated with reference to the dried substance.

CHARACTERS

A white or yellowish-white powder, slightly hygroscopic, very soluble in water, in alcohol and in methylene chloride.

IDENTIFICATION

- A. Dissolve 60 mg in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml of the solution to 100.0 ml with *methanol R*. Examined between 230 nm and 350 nm (2.2.25), the solution shows two absorption maxima, at 246 nm and 282 nm. The specific absorbances at the maxima are 115 to 125 and 57 to 63, respectively.
- B. Dissolve 0.2 g in 15 ml of *water R* and add 1 ml of *strong sodium hydroxide solution R*. Boil for 2 min and cool slightly. Add 7.5 ml of *dilute hydrochloric acid R* and filter. Wash the residue with *water R* and recrystallise from *alcohol (50 per cent V/V) R*. Dry at 100 °C to 105 °C for 1 h. Dissolve about 10 mg of the residue in 5 ml of *sulphuric acid R*. The solution has an intense yellow colour and shows an intense yellowish-green fluorescence when examined in ultraviolet light at 365 nm.
- C. Dissolve 50 mg in 0.1 ml of *water R* in a 25 ml flask and add 1 ml of a saturated solution of *potassium permanganate R*. Attach a fractionating column and a condenser, with the end of the delivery tube immersed in 1 ml of *water R* in a test-tube placed in a bath of iced water. Distil fairly vigorously and continue heating for 1 min after a dry residue has been obtained in the flask. Prepare a blank by introducing into an identical test-tube a volume of *water R* equal to that of the distillate. Place the tubes in a bath of iced water. To each tube, add 0.5 ml of a 20 per cent *V/V* solution of *morpholine R* and 0.5 ml of a freshly prepared 50 g/l solution of *sodium nitroprusside R*. Mix and allow to stand at 0 °C for 5 min and then at room temperature for 3 min. No blue colour develops in either tube. Add 1 g of *ammonium sulphate R*, mix and allow to stand for 15 min. A stable, intense pink colour develops in the test solution. A brownish-yellow colour develops in the blank.
- D. It gives reaction (a) of bromides (2.3.1).

TESTS

Appearance of solution. Dissolve 0.6 g in *water R* and dilute to 20 ml with the same solvent. The solution is clear (2.2.1).

Related substance. Examine by liquid chromatography (2.2.29).

Test solution (a). Dissolve 6 mg of the substance to be examined in a mixture of 40 volumes of *acetonitrile R* and 60 volumes of *water R* and dilute to 50 ml with the same mixture of solvents.

Test solution (b). Dissolve 6 mg of the substance to be examined in 30 ml of a mixture of 40 volumes of *acetonitrile R* and 60 volumes of *water R*. Add 5 ml of reference solution (b) and dilute to 50 ml with a mixture of 40 volumes of *acetonitrile R* and 60 volumes of *water R*.

Test solution (c). Dissolve 6 mg of *xanthidrol R1* and 6 mg of the substance to be examined in a mixture of 40 volumes of *acetonitrile R* and 60 volumes of *water R* and dilute to 50 ml with the same mixture of solvents.

Reference solution (a). Dissolve 6 mg of *xanthidrol R1* in a mixture of 40 volumes of *acetonitrile R* and 60 volumes of *water R* and dilute to 50 ml with the same mixture of solvents.

Reference solution (b). Dilute 5 ml of reference solution (a) to 50 ml with a mixture of 40 volumes of *acetonitrile R* and 60 volumes of *water R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter, packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of equal volumes of *acetonitrile R* and a solution containing 28 g/l of *sodium perchlorate R* and 11 g/l of *phosphoric acid R*, adjusted to pH 3.8 with *strong sodium hydroxide solution R* and then with 0.1 *M* *sodium hydroxide*,
- as detector a spectrophotometer set at 206 nm,
- a loop injector.

Inject 20 µl of test solution (c). The test is not valid unless the resolution between the peaks corresponding to propantheline and xanthidrol is at least 8.0. Inject 20 µl of test solution (a), 20 µl of reference solution (a) and 20 µl of test solution (b). Continue the chromatography for twice the retention time of the propantheline peak. In the chromatogram obtained with test solution (a), there is no peak corresponding to the principal peak in the chromatogram obtained with reference solution (a). In the chromatogram obtained with test solution (b), the area of any peak, apart from the principal peak and the xanthidrol peak, is not greater than the area of the xanthidrol peak (1.0 per cent) and not more than one such peak has an area greater than or equal to half the area of the xanthidrol peak (0.5 per cent). Disregard any peak with a retention time relative to that of the propantheline peak, less than 0.2 (bromide).

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.400 g in 50 ml of *acetic anhydride R*. Titrate with 0.1 *M* *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 *M* *perchloric acid* corresponds to 44.84 mg of $C_{23}H_{30}BrNO_3$.

STORAGE

Store in an airtight container.

01/2005:1558

PROPOFOL

Propofolum

$C_{12}H_{18}O$

M_r 178.3

DEFINITION

Propofol contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of 2,6-bis(1-methylethyl)phenol.

CHARACTERS

A colourless or very light yellow, clear liquid, very slightly soluble in water, miscible with hexane and with methanol.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24) as a thin film between potassium bromide plates, comparing with the spectrum obtained with the *propofol CRS*.

TESTS

Refractive index (2.2.6). The refractive index is not less than 1.5125 and not more than 1.5145.

Impurity J. Examine by liquid chromatography (2.2.29).

Prepare the solutions immediately before use and protect from light.

Test solution. Dissolve 0.5 g of the substance to be examined in *hexane R* and dilute to 10.0 ml with the same solvent.

Reference solution. Dissolve 5 µl of *propofol impurity J CRS* (corresponding to 5 mg) in *hexane R* and dilute to 50.0 ml with the same solvent. Dilute 5.0 ml of this solution to 100.0 ml with *hexane R*.

The chromatographic procedure used in the test for related substances may be used, by monitoring the eluate of the column at 254 nm in place of 275 nm.

Inject 20 µl of the test solution and 20 µl of the reference solution and continue the chromatography for 6 times the retention time of the propofol peak. In the chromatogram obtained with the test solution the area of any peak due to impurity J is not greater than 5 times the area of the peak due to impurity J in the chromatogram obtained with the reference solution (0.05 per cent).

Related substances. Examine by liquid chromatography (2.2.29) as described under Assay.

Inject 10 µl of reference solution (a) and continue the chromatography for 15 min. The resolution of the 2 principal peaks observed (impurity J, approximate retention time 2.5 min and propofol, approximate retention time 3 min) is at least 4.0.

Inject 10 µl of reference solution (b) and locate the peaks due to impurity G (relative retention about 0.5) and impurity E (relative retention about 5), both with respect to propofol.

Inject 10 µl of reference solution (c) and adjust the sensitivity of the system so that the height of the peak due to propofol is at least 50 per cent of the full scale of the recorder.

Inject separately 10 µl of test solution (a) and reference solution (c) and record the chromatogram of test solution (a) for 6 times the retention time of the peak due to propofol. In the chromatogram obtained with test solution (a): the area of any peak due to impurity G is not greater than 0.4 times the area of the peak due to propofol in the chromatogram obtained with reference solution (c) (0.2 per cent taking into account a response factor of 0.2); and the area of any peak due to impurity E is not greater than 0.4 times the area of the peak due to propofol in the chromatogram obtained with reference solution (c) (0.01 per cent taking into account a response factor of 4.0). The area of any other peak apart from that due to propofol and the 2 impurities is not greater than 0.5 times the area of the peak due to propofol in the chromatogram obtained with reference solution (c) (0.05 per cent). The sum of all impurities including impurity G and impurity E is not greater than 0.3 per cent. Disregard any peak with an area less than 0.25 times the area of the peak due to propofol in the chromatogram obtained with reference solution (c) (0.025 per cent).

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution (a). Dissolve 1.00 g of the substance to be examined in *hexane R* and dilute to 10.0 ml with the same solvent.

Test solution (b). Dissolve 0.240 g of the substance to be examined in *hexane R* and dilute to 100.0 ml with the same solvent.

Reference solution (a). Dissolve 5 µl of the substance to be examined and 15 µl of *propofol impurity J CRS* in *hexane R* and dilute to 50.0 ml with the same solvent.

Reference solution (b). Dilute 0.1 ml of *propofol for system suitability CRS* to 1.0 ml with *hexane R*.

Reference solution (c). Dilute 1.0 ml of test solution (a) to 100.0 ml with *hexane R*. Dilute 1.0 ml of this solution to 10.0 ml with *hexane R*.

Reference solution (d). Dissolve 0.240 g of *propofol CRS* in *hexane R* and dilute to 100.0 ml with the same solvent.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.20 m long and 5 mm in internal diameter packed with *silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 2.0 ml/min a mixture of 1.0 volumes of *ethanol R*, 7.5 volumes of *acetonitrile R* and 990 volumes of *hexane R*,
- as detector a spectrophotometer set at 275 nm.

Inject 10 µl of test solution (b) and 10 µl of reference solution (d). Continue the chromatography for 5 times the retention time of the peak due to propofol.

STORAGE

Store protected from light under an inert atmosphere of gas.

IMPURITIES

- A. R1 = CH(CH₃)₂, R2 = R3 = H: 2,4-bis(1-methylethyl)phenol,

PROPRANOLOL HYDROCHLORIDE

Propranololi hydrochloridum

$C_{16}H_{22}ClNO_2$

M_r 295.8

DEFINITION

Propranolol hydrochloride contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (2*RS*)-1-[(1-methylethyl)amino]-3-(naphthalen-1-yloxy)propan-2-ol hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, soluble in water and in alcohol.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

- Melting point (2.2.14): 163 °C to 166 °C.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *propranolol hydrochloride CRS*.
- Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. Dissolve 10 mg of the substance to be examined in 1 ml of *methanol R*.

Reference solution. Dissolve 10 mg of *propranolol hydrochloride CRS* in 1 ml of *methanol R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 1 volume of *concentrated ammonia RI* and 99 volumes of *methanol R*. Dry the plate at 100 °C to 105 °C and spray

with *anisaldehyde solution R*. Heat the plate at 100 °C to 105 °C until the colour of the spots reaches maximum intensity (10 min to 15 min). The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

D. It gives reaction (a) of chlorides (2.3.1).

TESTS

Appearance of solution. Dissolve 2.0 g in *methanol R* and dilute to 20 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than intensity 6 of the range of reference solutions of the most appropriate colour (2.2.2, *Method II*).

Acidity or alkalinity. Dissolve 0.20 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent. Add 0.2 ml of *methyl red solution R* and 0.2 ml of 0.01 *M hydrochloric acid*. The solution is red. Add 0.4 ml of 0.01 *M sodium hydroxide*. The solution is yellow.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 10.0 mg of *propranolol hydrochloride for performance test CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 2.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.8 ml/min a mixture prepared as follows: mix 1.6 g of *sodium laurilsulfate R* and 0.31 g of *tetrabutylammonium dihydrogen phosphate R* in a mixture of 1 ml of *sulphuric acid R*, 450 ml of *water R* and 550 ml of *acetonitrile R*; adjust to pH 3.3 using *dilute sodium hydroxide solution R*,
- as detector a spectrophotometer set at 292 nm.

Equilibrate the column for at least 30 min.

Inject 20 µl of reference solution (a). As a system suitability requirement, baseline separation is obtained between the peaks due to impurity A and propranolol; use the chromatogram supplied with *propranolol hydrochloride for performance test CRS* to identify the peak due to impurity A. Inject 20 µl of reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained is at least 50 per cent of the full scale of the recorder.

Inject 20 µl of the test solution. Continue the chromatography for five times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak apart from the principal peak, is not greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of the area of all peaks, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent).

Heavy metals (2.4.8). Dissolve 1.0 g in a mixture of 15 volumes of *water R* and 85 volumes of *methanol R* and dilute to 20 ml with the same mixture of solvents. 12 ml of the solution complies with limit test B for heavy metals (20 ppm). Prepare the standard using lead standard solution

(1 ppm Pb) prepared by diluting *lead standard solution* (100 ppm Pb) *R* with a mixture of 15 volumes of *water R* and 85 volumes of *methanol R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 25 ml of *alcohol R*. Titrate with 0.1 M *sodium hydroxide*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *sodium hydroxide* is equivalent to 29.58 mg of $C_{16}H_{22}ClNO_2$.

IMPURITIES

A. 3-(naphthalen-1-yloxy)propane-1,2-diol (diol derivative),

B. X = N-CH(CH₃)₂: 1,1'-[(1-methylethyl)imino]bis[3-(naphthalen-1-yloxy)propan-2-ol] (tertiary amine derivative),

C. X = O: 1,1'-oxybis[3-(naphthalen-1-yloxy)propan-2-ol] (bis-ether derivative).

01/2005:1039

PROPYL GALLATE

Propylis gallas

$C_{10}H_{12}O_5$

M_r 212.2

DEFINITION

Propyl gallate contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of propyl 3,4,5-trihydroxybenzoate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, very slightly soluble in water, freely soluble in ethanol (96 per cent). It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

A. Melting point (2.2.14): 148 °C to 151 °C.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *propyl gallate CRS*.

C. Examine the chromatograms obtained in the test for gallic acid. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Dissolve about 10 mg in 10 ml of *water R* by heating to about 70 °C. Cool and add 1 ml of *bismuth subnitrate solution R*. A bright yellow precipitate is formed.

TESTS

Appearance of solution. Dissolve 1.0 g in *ethanol* (96 per cent) *R* and dilute to 20 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution BY₅ (2.2.2, *Method II*).

Gallic acid. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution (a). Dissolve 0.20 g of the substance to be examined in *acetone R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 20 ml with *acetone R*.

Reference solution (a). Dissolve 10 mg of *propyl gallate CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 20 mg of *gallic acid R* in *acetone R* and dilute to 20 ml with the same solvent. Dilute 1 ml of the solution to 10 ml with *acetone R*.

Reference solution (c). Dilute 0.5 ml of test solution (b) to 5 ml with reference solution (b).

Apply separately to the plate 5 µl of each solution. Develop over a path of 8 cm using a mixture of 10 volumes of *anhydrous formic acid R*, 40 volumes of *ethyl formate R* and 50 volumes of *toluene R*. Allow the plate to dry in air for 10 min and spray with a mixture of 1 volume of *ferric chloride solution R1* and 9 volumes of *ethanol* (96 per cent) *R*. Any spot due to gallic acid in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows 2 clearly separated principal spots.

Total chlorine. Mix 0.5 g with 2 g of *calcium carbonate R1*. Dry and ignite at 700 °C. Take up the residue with 20 ml of *dilute nitric acid R* and dilute to 30 ml with *water R*. 15 ml of the solution, without further addition of *dilute nitric acid R*, complies with the limit test for chlorides (2.4.4) (200 ppm).

Chlorides (2.4.4). To 1.65 g add 50 ml of *water R*. Shake for 5 min. Filter. 15 ml of the filtrate complies with the limit test for chlorides (100 ppm).

Zinc. Not more than 25 ppm of Zn, determined by atomic absorption spectrometry (2.2.23, *Method II*).

Test solution. To 2.5 ml of the solution obtained in the test for heavy metals, add 2.5 ml of *water R*.

Reference solutions. Prepare the reference solutions using *zinc standard solution* (10 ppm Zn) *R*, diluted as necessary with *water R*.

Measure the absorbance at 213.9 nm using a zinc hollow-cathode lamp as the source of radiation and an air-acetylene flame.

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the reference solution using 2 ml of *lead standard solution* (10 ppm Pb) *R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in *methanol R* and dilute to 250.0 ml with the same solvent. Dilute 5.0 ml of the solution to 200.0 ml with *methanol R*. Measure the absorbance (2.2.25) at the absorption maximum at 275 nm.

Calculate the content of $C_{10}H_{12}O_3$ taking the specific absorbance to be 503.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A.

A. 3,4,5-trihydroxybenzoic acid (gallic acid).

01/2005:0431

PROPYL PARAHYDROXYBENZOATE

Propylis parahydroxybenzoas

$C_{10}H_{12}O_3$

M_r 180.2

DEFINITION

Propyl 4-hydroxybenzoate.

Content: 98.0 per cent to 102.0 per cent.

CHARACTERS

Appearance: white, crystalline powder.

Solubility: very slightly soluble in water, freely soluble in alcohol and in methanol.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. Melting point (2.2.14): 96 °C to 99 °C.

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: propyl parahydroxybenzoate CRS.

C. Examine the chromatograms obtained in the test for related substances.

Results: the principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (b).

D. To about 10 mg in a test-tube add 1 ml of *sodium carbonate solution R*, boil for 30 s and cool (solution A). To a further 10 mg in a similar test-tube add 1 ml of

sodium carbonate solution R; the substance partly dissolves (solution B). Add at the same time to solution A and solution B 5 ml of *aminopyrazolone solution R* and 1 ml of *potassium ferricyanide solution R* and mix. Solution B is yellow to orange-brown. Solution A is orange to red, the colour being clearly more intense than any similar colour which may be obtained with solution B.

TESTS

Solution S. Dissolve 1.0 g in *alcohol R* and dilute to 10 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, Method II).

Acidity. To 2 ml of solution S add 3 ml of *alcohol R*, 5 ml of *carbon dioxide-free water R* and 0.1 ml of *bromocresol green solution R*. Not more than 0.1 ml of 0.1 M *sodium hydroxide* is required to change the colour of the indicator to blue.

Related substances. Thin-layer chromatography (2.2.27).

Test solution (a). Dissolve 0.10 g of the substance to be examined in *acetone R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *acetone R*.

Reference solution (a). Dilute 0.5 ml of test solution (a) to 100 ml with *acetone R*.

Reference solution (b). Dissolve 10 mg of *propyl parahydroxybenzoate CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (c). Dissolve 10 mg of *ethyl parahydroxybenzoate CRS* in 1 ml of test solution (a) and dilute to 10 ml with *acetone R*.

Plate: suitable octadecylsilyl silica gel with a fluorescent indicator having an optimal intensity at 254 nm as the coating substance.

Mobile phase: *glacial acetic acid R*, *water R*, *methanol R* (1:30:70 V/V/V).

Application: 2 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: the chromatogram obtained with reference solution (c) shows 2 clearly separated principal spots.

Limits:

- *any impurity:* any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent).

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

To 1.000 g add 20.0 ml of 1 M *sodium hydroxide*. Heat at about 70 °C for 1 h. Cool rapidly in an ice bath. Prepare a blank in the same manner. Carry out the titration on the solutions at room temperature. Titrate the excess sodium hydroxide with 0.5 M *sulphuric acid*, continuing the titration until the second point of inflexion and determining the end-point potentiometrically (2.2.20).

1 ml of 1 M *sodium hydroxide* is equivalent to 180.2 mg of $C_{10}H_{12}O_3$.

IMPURITIES

- A. R = H: 4-hydroxybenzoic acid,
 B. R = CH₃: methyl 4-hydroxybenzoate,
 C. R = CH₂-CH₃: ethyl 4-hydroxybenzoate,
 D. R = CH₂-CH₂-CH₂-CH₃: butyl 4-hydroxybenzoate.

01/2005:0430

PROPYLENE GLYCOL

Propylenglycolum

C₃H₈O₂M_r 76.1

DEFINITION

Propylene glycol is (*RS*)-propane-1,2-diol.

CHARACTERS

A viscous, clear, colourless, hygroscopic liquid, miscible with water and with ethanol (96 per cent).

IDENTIFICATION

- A. It complies with the test for relative density (see Tests).
 B. It complies with the test for refractive index (see Tests).
 C. Boiling point (2.2.12): 184 °C to 189 °C.
 D. To 0.5 ml add 5 ml of *pyridine R* and 2 g of finely ground *nitrobenzoyl chloride R*. Boil for 1 min and pour into 15 ml of cold *water R* with shaking. Filter, wash the precipitate with 20 ml of a saturated solution of *sodium hydrogen carbonate R* and then with *water R* and dry. Dissolve in boiling *ethanol (80 per cent V/V) R* and filter the hot solution. On cooling, crystals are formed which, after drying at 100-105 °C, melt (2.2.14) at 121 °C to 128 °C.

TESTS

Appearance. It is clear (2.2.1) and colourless (2.2.2, *Method II*).

Relative density (2.2.5): 1.035 to 1.040.

Refractive index (2.2.6): 1.431 to 1.433.

Acidity. To 10 ml add 40 ml of *water R* and 0.1 ml of *bromothymol blue solution R1*. The solution is greenish-yellow. Not more than 0.05 ml of 0.1 M *sodium hydroxide* is required to change the colour of the indicator to blue.

Oxidising substances. To 10 ml add 5 ml of *water R*, 2 ml of *potassium iodide solution R* and 2 ml of *dilute sulphuric acid R* and allow to stand in a ground-glass-stoppered flask protected from light for 15 min. Titrate with 0.05 M *sodium thiosulphate*, using 1 ml of *starch solution R* as indicator. Not more than 0.2 ml of 0.05 M *sodium thiosulphate* is required.

Reducing substances. To 1 ml add 1 ml of *dilute ammonia R1* and heat in a water-bath at 60 °C for 5 min. The solution is not yellow. Immediately add 0.15 ml of 0.1 M *silver nitrate* and allow to stand for 5 min. The solution does not change its appearance.

Heavy metals (2.4.8). Mix 4 ml with 16 ml of *water R*. 12 ml of the solution complies with limit test A for heavy metals (5 ppm *m/V*). Prepare the reference solution using *lead standard solution (1 ppm Pb) R*.

Water (2.5.12). Not more than 0.2 per cent, determined on 5.00 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Heat 50 g until it burns and ignite. Allow to cool. Moisten the residue with *sulphuric acid R* and ignite; repeat the operations. The residue weighs not more than 5 mg (0.01 per cent).

STORAGE

Store in an airtight container.

01/2005:2122

PROPYLENE GLYCOL
DICAPRYLOCAPRATE

Propylenglycoli dicaprylocapras

DEFINITION

Propylene glycol diesters of saturated fatty acids, mainly caprylic acid (octanoic acid; C₈H₁₆O₂) and capric acid (decanoic acid; C₁₀H₂₀O₂), of vegetable origin.

CHARACTERS

Appearance: almost colourless to light yellow, oily liquid.

Solubility: practically insoluble in water, soluble in fatty oils and in light petroleum, slightly soluble in anhydrous ethanol.

IDENTIFICATION

- A. Refractive index (2.2.6): 1.439 to 1.442.
 B. Relative density (2.2.5): 0.910 to 0.930.
 C. Viscosity (2.2.9): 9 mPas to 12 mPas.
 D. It complies with the test for composition of fatty acids (see Tests).

TESTS

Appearance. The substance to be examined is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, *Method II*).

Acid value (2.5.1): maximum 0.2.

Hydroxyl value (2.5.3, *Method A*): maximum 10.

Iodine value (2.5.4): maximum 1.0.

Peroxide value (2.5.5, *Method A*): maximum 1.0.

Saponification value (2.5.6): 320 to 340.

Unsaponifiable matter (2.5.7): maximum 0.3 per cent, determined on 5.0 g.

Alkaline impurities. Dissolve 2.00 g of the substance to be examined in a mixture of 1.5 ml of *ethanol (96 per cent) R* and 3.0 ml of *ether R*. Add 0.05 ml of *bromophenol blue solution R*. Not more than 0.15 ml of 0.01 M *hydrochloric acid* is required to change the colour of the indicator to yellow.

Composition of fatty acids. Gas chromatography (2.4.22, Method C). Prepare reference solution (a) as indicated in Table 2.4.22.-2.

Column:

- **material:** fused silica,
- **size:** $l = 30$ m, $\varnothing = 0.32$ mm,
- **stationary phase:** macrogol 20 000 R (film thickness 0.5 μ m),

Carrier gas: helium for chromatography R.

Flow rate: 1.3 ml/min.

Split ratio: 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 1	70
	1 - 35	70 $\rightarrow$ 240
	35 - 50	240
Injection port		250
Detector		250

Detection: flame ionisation.

Composition of the fatty acid fraction of the substance to be examined:

- **caproic acid:** maximum 2.0 per cent,
- **caprylic acid:** 50.0 per cent to 80.0 per cent,
- **capric acid:** 20.0 per cent to 50.0 per cent,
- **lauric acid:** maximum 3.0 per cent,
- **myristic acid:** maximum 1.0 per cent.

Water (2.5.12): maximum 0.1 per cent, determined on 5.00 g.

Total ash (2.4.16): maximum 0.1 per cent, determined on 2.0 g.

STORAGE

Protected from light.

Reference solution. Dissolve 0.1 g of *propylene glycol dilaurate CRS* in *methylene chloride R* and dilute to 2 ml with the same solvent.

Plate: TLC silica gel plate R.

Mobile phase: hexane R, ether R (30:70 V/V).

Application: 10 μ l.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with a 0.1 g/l solution of *rhodamine 6 G R* in *alcohol R*. Examine in ultraviolet light at 365 nm.

Results: the spots in the chromatogram obtained with the test solution are similar in position to those in the chromatogram obtained with the reference solution.

B. It complies with the test for composition of fatty acids (see Tests).

C. It complies with the assay (content of diesters).

TESTS

Acid value (2.5.1): maximum 4.0, determined on 5.00 g.

Iodine value (2.5.4, Method A): maximum 1.0.

Saponification value (2.5.6): 230 to 250.

Composition of fatty acids. Gas chromatography (2.4.22, Method C). Use the mixture of calibrating substances in Table 2.4.22.-2.

Composition of the fatty acid fraction of the substance:

- **caprylic acid:** maximum 0.5 per cent,
- **capric acid:** maximum 2.0 per cent,
- **lauric acid:** minimum 95.0 per cent,
- **myristic acid:** maximum 3.0 per cent,
- **palmitic acid:** maximum 1.0 per cent.

Free propylene glycol: maximum 2.0 per cent, determined as prescribed under Assay.

Water (2.5.12): maximum 1.0 per cent, determined on 1.00 g.

Total ash (2.4.16): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Size-exclusion chromatography (2.2.30).

Stock solution. Introduce 0.100 g of *propylene glycol R* into a flask and dilute to 25.0 ml with *tetrahydrofuran R*.

Test solution. In a 15 ml flask, weigh 0.200 g (*m*). Add 5.0 ml of *tetrahydrofuran R* and shake to dissolve. Reweigh the flask and calculate the total mass of solvent and substance (*M*).

Reference solutions. Into four 15 ml flasks, introduce respectively 0.25 ml, 0.5 ml, 1.0 ml and 2.5 ml of stock solution and add 5.0 ml of *tetrahydrofuran R*. Weigh each flask and calculate the concentration of propylene glycol in milligrams per gram for each reference solution.

Column:

- **size:** $l = 0.6$ m, $\varnothing = 7$ mm,
- **stationary phase:** styrene-divinylbenzene copolymer R (5 μ m) with a pore size of 10 nm.

Mobile phase: *tetrahydrofuran R*.

Flow rate: 1 ml/min.

Detection: differential refractometer.

Injection: 40 μ l.

Relative retention with reference to propylene glycol: diesters = about 0.85; monoesters = about 0.90.

01/2005:2087
corrected

PROPYLENE GLYCOL DILAURATE

Propylenglycoli dilauras

DEFINITION

Mixture of propylene glycol mono- and diesters of lauric acid.

Content: minimum 70.0 per cent of diesters and maximum 30.0 per cent of monoesters.

CHARACTERS

Appearance: clear, oily liquid at 20 °C, colourless or slightly yellow.

Solubility: practically insoluble in water, very soluble in alcohol, in methanol and in methylene chloride.

IDENTIFICATION

A. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 0.1 g of the substance to be examined in *methylene chloride R* and dilute to 2 ml with the same solvent.

Calculations:

- **free propylene glycol:** from the calibration curve obtained with the reference solutions, determine the concentration (*C*) in milligrams per gram in the test solution and calculate the percentage content in the substance to be examined using the following expression:

$$\frac{C \times M}{m \times 10}$$

- **monoesters:** calculate the percentage content of monoesters using the following expression:

$$\frac{A}{A + B} \times (100 - D)$$

A = area of the peak due to the monoesters,

B = area of the peak due to the diesters,

D = percentage content of free propylene glycol + percentage content of free fatty acids.

Calculate the percentage content of free fatty acids using the expression:

$$\frac{I_A \times 200}{561.1}$$

I_A = acid value.

- **diesters:** calculate the percentage content of diesters using the following expression:

$$\frac{B}{A + B} \times (100 - D)$$

STORAGE

Protected from moisture.

01/2005:1915
corrected

PROPYLENE GLYCOL MONOLAUROATE**Propylenglycoli monolauras****DEFINITION**

Mixture of propylene glycol mono- and diesters of lauric acid.

Content:

- propylene glycol monolaurate (type I): 45.0 per cent to 70.0 per cent of monoesters and 30.0 per cent to 55.0 per cent of diesters,
- propylene glycol monolaurate (type II): minimum 90.0 per cent of monoesters and maximum 10.0 per cent of diesters.

CHARACTERS

Appearance: clear, oily liquid at 20 °C, colourless or slightly yellow.

Solubility: practically insoluble in water, very soluble in alcohol, in methanol and in methylene chloride.

IDENTIFICATION**A. Thin-layer chromatography (2.2.27).**

Test solution. Dissolve 0.1 g of the substance to be examined in *methylene chloride R* and dilute to 2 ml with the same solvent.

Reference solution. Dissolve 0.1 g of *propylene glycol monolaurate CRS* in *methylene chloride R* and dilute to 2 ml with the same solvent.

Plate: *TLC silica gel plate R.*

Mobile phase: *hexane R, ether R (30:70 V/V).*

Application: 10 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with a 0.1 g/l solution of *rhodamine 6 G R* in *alcohol R*. Examine in ultraviolet light at 365 nm.

Results: the spots in the chromatogram obtained with the test solution are similar in position to those in the chromatogram obtained with the reference solution.

B. It complies with the test for composition of fatty acids (see Tests).

C. It complies with the assay (content of monoesters).

TESTS

Acid value (2.5.1): maximum 4.0, determined on 5.00 g.

Iodine value (2.5.4, Method A): maximum 1.0.

Saponification value (2.5.6): 210 to 245 for propylene glycol monolaurate (type I) and 200 to 230 for propylene glycol monolaurate (type II).

Composition of fatty acids. Gas chromatography (2.4.22, Method C). Use the mixture of calibrating substances in Table 2.4.22.-2.

Composition of the fatty acid fraction of the substance:

- *caprylic acid:* maximum 0.5 per cent,
- *capric acid:* maximum 2.0 per cent,
- *lauric acid:* minimum 95.0 per cent,
- *myristic acid:* maximum 3.0 per cent,
- *palmitic acid:* maximum 1.0 per cent.

Free propylene glycol: maximum 5.0 per cent for propylene glycol monolaurate (type I) and maximum 1.0 per cent for propylene glycol monolaurate (type II), determined as prescribed under Assay.

Water (2.5.12): maximum 1.0 per cent, determined on 1.00 g.

Total ash (2.4.16): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Size-exclusion chromatography (2.2.30).

Stock solution. Introduce 0.100 g of *propylene glycol R* into a vial and dilute to 25.0 ml with *tetrahydrofuran R*.

Test solution. In a 15 ml flask, weigh 0.200 g (*m*). Add 5.0 ml of *tetrahydrofuran R* and shake to dissolve. Reweigh the flask and calculate the total mass of solvent and substance (*M*).

Reference solutions. Into four 15 ml flasks, introduce respectively 0.25 ml, 0.5 ml, 1.0 ml and 2.5 ml of stock solution and add 5.0 ml of *tetrahydrofuran R*. In a fifth 15 ml flask, introduce 5.0 ml of stock solution. Weigh each flask and calculate the concentration of propylene glycol in milligrams per gram for each reference solution.

Column:

- **size:** *l* = 0.6 m, Ø = 7 mm,
- **stationary phase:** *styrene-divinylbenzene copolymer R* (5 µm) with a pore size of 10 nm.

Mobile phase: *tetrahydrofuran R.*

Flow rate: 1 ml/min.

Detection: differential refractometer.

Injection: 40 µl.

Relative retention with reference to propylene glycol: diesters = about 0.85; monoesters = about 0.90.

Calculations:

- *free propylene glycol*: from the calibration curve obtained with the reference solutions, determine the concentration (*C*) in milligrams per gram in the test solution and calculate the percentage content in the substance to be examined using the following expression:

$$\frac{C \times M}{m \times 10}$$

- *monoesters*: calculate the percentage content of monoesters using the following expression:

$$\frac{A}{A + B} \times (100 - D)$$

- A* = area of the peak due to the monoesters,
B = area of the peak due to the diesters,
D = percentage content of free propylene glycol + percentage content of free fatty acids.

Calculate the percentage content of free fatty acids using the expression:

$$\frac{I_A \times 200}{561.1}$$

I_A = acid value.

- *diesters*: calculate the percentage content of diesters using the following expression:

$$\frac{B}{A + B} \times (100 - D)$$

STORAGE

Protected from moisture.

LABELLING

The label states the type of propylene glycol monolaurate (type I or type II).

01/2005:1469

PROPYLENE GLYCOL MONOPALMITOSTEARATE

Propylenglycoli monopalmitostearas

DEFINITION

Mixture of propylene glycol mono- and diesters and of stearic and palmitic acids, produced by the condensation of propylene glycol and stearic acid 50 of vegetable or animal origin (see *Stearic acid* (1474)).

Content: minimum of 50.0 per cent of monoesters.

CHARACTERS

Appearance: white or almost white, waxy solid.

Solubility: practically insoluble in water, soluble in acetone and in hot alcohol.

IDENTIFICATION

- A. It complies with the test for melting point (see Tests).
- B. It complies for the test for composition of fatty acids (see Tests).
- C. It complies with the assay (monoesters content).

TESTS

Melting point (2.2.15): 33 °C to 40 °C.

Acid value (2.5.1): maximum 4.0, determined on 10.0 g.

Iodine value (2.5.4): maximum 3.0.

Saponification value (2.5.6): 170 to 185, determined on 2.0 g.

Composition of fatty acids (2.4.22, Method A). The fatty acid fraction has the following composition:

- *stearic acid*: 40.0 per cent to 60.0 per cent,
- *sum of contents of palmitic acid and stearic acid*: minimum 90.0 per cent.

Free propylene glycol: maximum 5.0 per cent, determined as prescribed under Assay.

Total ash (2.4.16): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Size-exclusion chromatography (2.2.30).

Test solution. In a 15 ml flask, weigh about 0.2 g (*m*), to the nearest 0.1 mg. Add 5.0 ml of *tetrahydrofuran R* and shake to dissolve. Heat gently, if necessary. Reweigh the flask and calculate the total mass of solvent and substance (*M*).

Reference solutions. In four 15 ml flasks, weigh, to the nearest 0.1 mg, about 2.5 mg, 5.0 mg, 10.0 mg and 20.0 mg of *propylene glycol R*. Add 5.0 ml of *tetrahydrofuran R* and shake to dissolve. Weigh the flasks again and calculate the concentration of propylene glycol in milligrams per gram for each reference solution.

Column:

- *size*: *l* = 0.6 m, Ø = 7 mm,
- *stationary phase*: *styrene-divinylbenzene copolymer R* (particle diameter 5 µm, pore size 10 nm).

Mobile phase: *tetrahydrofuran R*.

Flow rate: 1 ml/min.

Detection: differential refractometer.

Injection: 40 µl.

Relative retention with reference to propylene glycol: diesters = about 0.78, monoesters = about 0.84.

Limits:

- *free propylene glycol*: from the calibration curve obtained with the reference solutions, determine the concentration (*C*) in milligrams per gram in the test solution and calculate the percentage content in the substance to be examined using the following expression:

$$\frac{C \times M}{m \times 10}$$

- *monoesters*: calculate the percentage content of monoesters using the following expression:

$$\frac{A}{A + B} \times (100 - D)$$

- A = area of the peak due to the monoesters,
 B = area of the peak due to the diesters,
 D = percentage content of free propylene glycol + percentage content of free fatty acids which is determined using the following expression:

$$\frac{I_A \times 270}{561.1}$$

I_A = acid value.

STORAGE

Protected from light.

PROPYLTHIOURACIL

Propylthiouracilum

$C_7H_{10}N_2OS$

M_r 170.2

DEFINITION

Propylthiouracil contains not less than 98.0 per cent and not more than the equivalent of 100.5 per cent of 2,3-dihydro-6-propyl-2-thioxypyrimidin-4(1H)-one, calculated with reference to the dried substance.

CHARACTERS

White or almost white, crystalline powder or crystals, very slightly soluble in water, sparingly soluble in alcohol. It dissolves in solutions of alkali hydroxides.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

- A. Melting point (2.2.14): 217 °C to 221 °C.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *propylthiouracil CRS*. Examine as discs prepared using 1 mg of substance and 0.3 g of *potassium bromide R*.
- C. Examine the chromatograms obtained in the test for impurity A and related substances in ultraviolet light at 254 nm before exposure of the plate to iodine vapour. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).
- D. To about 20 mg add 8 ml of *bromine water R* and shake for a few minutes. Boil until the mixture is decolourised, allow to cool and filter. To the filtrate add 2 ml of *barium*

chloride solution R1. A white precipitate is formed whose colour does not become violet on the addition of 5 ml of *dilute sodium hydroxide solution R*.

TESTS

Impurity A and related substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel GF₂₅₄ plate R*.

Test solution (a). Dissolve 0.1 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methanol R*.

Reference solution (a). Dissolve 10 mg of *propylthiouracil CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 50 mg of *thiourea R* in *methanol R* and dilute to 100 ml with the same solvent. Dilute 1 ml of this solution to 100 ml with *methanol R*.

Reference solution (c). Dilute 1 ml of test solution (a) to 100 ml with *methanol R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 0.1 volumes of *glacial acetic acid R*, 6 volumes of *2-propanol R* and 50 volumes of *chloroform R*. Allow the plate to dry in air. Examine in ultraviolet light at 254 nm. Expose the plate to iodine vapour for 10 min. In the chromatogram obtained with test solution (a), any spot corresponding to impurity A is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.05 per cent) and any spot apart from the principal spot and any spot corresponding to impurity A is not more intense than the spot in the chromatogram obtained with reference solution (c) (1.0 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test F for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

To 0.300 g add 30 ml of *water R* and 30.0 ml of 0.1 M *sodium hydroxide*. Boil and shake until dissolution is complete. Add 50 ml of 0.1 M *silver nitrate* while stirring, boil gently for 5 min and cool. Titrate with 0.1 M *sodium hydroxide*, determining the end-point potentiometrically (2.2.20). The volume of 0.1 M *sodium hydroxide* used is equal to the sum of the volume added initially and the volume used in the final titration.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 8.511 mg of $C_7H_{10}N_2OS$.

STORAGE

Store protected from light.

IMPURITIES

A. thiourea.

01/2005:0636

PROPYPHENAZONE

Propyphenazonum

 $C_{14}H_{18}N_2O$ M_r 230.3

DEFINITION

Propyphenazone contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 1,5-dimethyl-4-(1-methylethyl)-2-phenyl-1,2-dihydro-3H-pyrazol-3-one, calculated with reference to the dried substance.

CHARACTERS

A white or slightly yellowish, crystalline powder, slightly soluble in water, freely soluble in alcohol and in methylene chloride.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

- Melting point (2.2.14): 102 °C to 106 °C.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *propyphenazone* CRS. Examine the substances prepared as discs.
- Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- To 1 ml of solution S (see Tests) add 0.1 ml of *ferric chloride solution R1*. A brownish-red colour appears which becomes yellow on addition of 1 ml of *dilute hydrochloric acid R*.

TESTS

Solution S. Dissolve 2 g in a mixture of equal volumes of *alcohol R* and *carbon dioxide-free water R* and dilute to 50 ml with the same mixture of solvents.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *phenolphthalein solution R*. The solution is colourless. Add 0.2 ml of 0.01 M *sodium hydroxide*; the solution becomes pink. Add 0.4 ml of 0.01 M *hydrochloric acid*; the solution becomes colourless. Add 0.2 ml of *methyl red solution R*. The solution becomes orange or red.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel HF₂₅₄ R* as the coating substance.

Test solution (a). Dissolve 0.40 g of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 5 ml with *methanol R*.

Reference solution (a). Dissolve 80 mg of *propyphenazone* CRS in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dilute 1 ml of test solution (b) to 100 ml with *methanol R*.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *butanol R*, 45 volumes of *cyclohexane R* and 45 volumes of *ethyl acetate R*. Dry the plate in a current of hot air for 15 min and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent). Spray with a mixture of equal volumes of *potassium ferricyanide solution R* and *ferric chloride solution R1*. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test C (10 ppm). Prepare the standard using 1 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C for 4 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 0.5 g.

ASSAY

Dissolve 0.2000 g in 10 ml of *anhydrous acetic acid R* and add 75 ml of *ethylene chloride R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 23.03 mg of $C_{14}H_{18}N_2O$.

STORAGE

Store protected from light.

IMPURITIES

A. phenazone,

B. 5-methoxy-3-methyl-4-(1-methylethyl)-1-phenyl-1H-pyrazole,

C. 4-[(1*RS*)-1,3-dimethylbutyl]-1,5-dimethyl-2-phenyl-1,2-dihydro-3H-pyrazol-3-one.

01/2005:0686

PROTAMINE HYDROCHLORIDE

Protamini hydrochloridum

DEFINITION

Protamine hydrochloride consists of the hydrochlorides of basic peptides extracted from the sperm or roe of fish, usually species of *Salmonidae* and *Clupeidae*. It binds with

heparin in solution, inhibiting its anticoagulant activity; in the conditions of the assay this binding gives rise to a precipitate. Calculated with reference to the dried substance, 1 mg of protamine hydrochloride precipitates not less than 100 IU of heparin.

PRODUCTION

Protamine hydrochloride is prepared in conditions designed to minimise the risk of microbial contamination.

The method of manufacture is validated to demonstrate that the product, if tested, would comply with the following test:

Abnormal toxicity (2.6.9). Inject into each mouse 0.5 mg dissolved in 0.5 ml of *water for injections R*.

CHARACTERS

Appearance: white or almost white powder, hygroscopic.

Solubility: soluble in water, practically insoluble in alcohol.

IDENTIFICATION

A. Specific optical rotation (2.2.7): -40 to -60 (dried substance).

Dissolve 1.000 g in 0.1 M *hydrochloric acid* and dilute to 100.0 ml with the same solvent.

B. In the conditions of the assay, protamine hydrochloride forms a precipitate.

C. To 0.5 ml of solution S (see Tests) add 4.5 ml of *water R*, 1.0 ml of a 100 g/l solution of *sodium hydroxide R* and 1.0 ml of a 0.2 g/l solution of α -*naphthol R* and mix. Cool the mixture to 5 °C. Add 0.5 ml of *sodium hypobromite solution R*. An intense red colour is produced.

D. Heat 2 ml of solution S in a water-bath at 60 °C and add 0.1 ml of *mercuric sulphate solution R*. Mix. No precipitate is formed. Cool the mixture in iced water. A precipitate is formed.

E. It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 0.50 g in *water R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. The solution is not more opalescent than reference suspension II (2.2.1) and not more intensely coloured than reference solution BY₆ or Y₆ (2.2.2, *Method II*). To 2.5 ml of solution S add 7.5 ml of *water R*.

Absorbance (2.2.25): maximum 0.1 between wavelengths of 260 nm to 280 nm.

Dilute 2.5 ml of solution S to 5.0 ml with *water R*.

Chloride: 12.3 per cent to 19.0 per cent (dried substance).

Dissolve 0.400 g in 50 ml of *water R*. Add 5 ml of *dilute nitric acid R*, 25.0 ml of 0.1 M *silver nitrate* and 2 ml of *dibutyl phthalate R* and shake. Titrate with 0.1 M *ammonium thiocyanate* using 2 ml of *ferric ammonium sulphate solution R2* as indicator; shake vigorously when approaching the end-point.

1 ml of 0.1 M *silver nitrate* is equivalent to 3.545 mg of chloride (Cl).

Sulphates: maximum 4.0 per cent (dried substance).

Dissolve 0.500 g in 200 ml of *distilled water R*, add 5.0 ml of *dilute hydrochloric acid R* and heat to boiling. Add dropwise 10 ml of a hot 100 g/l solution of *barium chloride R* while stirring with a glass rod, cover the beaker with a watch glass and allow to stand on a water-bath for 2 h to obtain a coarse granular precipitate. Add 0.1 ml of a 100 g/l solution of *barium chloride R* to the clear supernatant liquid. If a turbidity develops, repeat the precipitation procedure. Transfer the precipitate quantitatively to a previously ignited

and tared porcelain crucible and wash with hot *distilled water R* until the addition of *silver nitrate solution R1* to the washings produces no opalescence. Ignite the precipitate at 600 °C for 1 h. Allow to cool in a desiccator and weigh.

1 mg of residue is equivalent to 0.412 mg of sulphate (SO₄).

Barium: maximum 10 ppm.

Atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dissolve 1.0 g of the substance to be examined in *distilled water R*, add 1 ml of a 250 g/l solution of *caesium chloride R* and 0.2 ml of *hydrochloric acid R* and dilute to 20.0 ml with *distilled water R*.

Reference solution. To 1.0 ml of *barium standard solution* (50 ppm Ba) *R* add 5 ml of a 250 g/l solution of *caesium chloride R* and 1 ml of *hydrochloric acid R* and dilute to 100.0 ml with *distilled water R*.

Source: hollow-cathode lamp.

Wavelength: 553.3 nm.

Flame: air-acetylene-nitrous oxide flame of suitable composition.

Iron (2.4.9): maximum 10 ppm.

Dissolve 1.0 g with heating in *water R* and dilute to 10 ml with the same solvent.

Mercury: maximum 10 ppm.

Introduce 2.0 g of the substance to be examined into a ground-glass-stoppered 250 ml conical flask and add 20 ml of a mixture of equal volumes of *nitric acid R* and *sulphuric acid R*. Boil under a reflux condenser for 1 h, cool and cautiously dilute with *water R*. Boil until nitrous fumes are no longer seen. Cool the solution, cautiously dilute to 200.0 ml with *water R*, mix and filter. Transfer 50.0 ml of the filtrate to a separating funnel. Shake with successive small portions of *chloroform R* until the chloroform layer remains colourless. Discard the chloroform layers. To the aqueous layer add 25 ml of *dilute sulphuric acid R*, 115 ml of *water R* and 10 ml of a 200 g/l solution of *hydroxylamine hydrochloride R*. Titrate with *dithizone solution R2*; after each addition, shake the mixture 20 times and towards the end of the titration allow to separate and discard the chloroform layer. Titrate until a bluish-green colour is obtained. Calculate the content of mercury using the equivalent in micrograms of mercury per millilitre of titrant determined in the standardisation of the *dithizone solution R2*.

Nitrogen: 23.0 per cent to 27.0 per cent (dried substance).

Carry out the determination of nitrogen by sulphuric acid digestion (2.5.9), using 10.0 mg and heating for 3-4 h.

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test D. Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) *R*.

Loss on drying (2.2.32): maximum 5.0 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 3 h.

Bacterial endotoxins (2.6.14): less than 7.0 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Test solution (a). Dissolve 15.0 mg of the substance to be examined in *water R* and dilute to 100.0 ml with the same solvent.

Test solution (b). Dilute 2.0 ml of test solution (a) to 3.0 ml with *water R*.

Test solution (c). Dilute 1.0 ml of test solution (a) to 3.0 ml with *water R*.

Use as titrant a 1 in 6 dilution of *heparin sodium BRP* in *water R* (for example, 1.7 ml diluted to 10.0 ml with *water R*). Titrate each test solution in duplicate as follows: introduce an accurately measured volume of the solution to be titrated, for example, 1.5 ml, into the cell of a suitable colorimeter, set the apparatus for measurement at a suitable wavelength (none is critical) in the visible range, add the titrant in small volumes until there is a sharp increase in the absorbance and note the volume of titrant added.

Carry out 3 independent assays. For each individual titration, calculate the number of International Units of heparin in the volume of titrant added at the end-point per milligram of the substance to be examined. Calculate the potency of the substance as the average of the 18 values. Test the linearity of the response by the usual statistical methods. Calculate the 3 standard deviations for the results obtained with each of the 3 test solutions. Calculate the three standard deviations for the results obtained with each of the 3 independent assays. The assay is not valid unless each of the 6 standard deviations is less than 5 per cent of the average result.

STORAGE

In an airtight, tamper-proof container. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

01/2005:0569

PROTAMINE SULPHATE

Protamini sulfas

DEFINITION

Protamine sulphate consists of the sulphates of basic peptides extracted from the sperm or roe of fish, usually species of *Salmonidae* and *Clupeidae*. It binds with heparin in solution, inhibiting its anticoagulant activity; in the conditions of the assay this binding gives rise to a precipitate. Calculated with reference to the dried substance, 1 mg of protamine sulphate precipitates not less than 100 IU of heparin.

PRODUCTION

Protamine sulphate is prepared in conditions designed to minimise the risk of microbial contamination.

The method of manufacture is validated to demonstrate that the product, if tested, would comply with the following test:

Abnormal toxicity (2.6.9). Inject into each mouse 0.5 mg dissolved in 0.5 ml of *water for injections R*.

CHARACTERS

Appearance: white or almost white powder, hygroscopic.

Solubility: sparingly soluble in water, practically insoluble in alcohol.

IDENTIFICATION

A. Specific optical rotation (2.2.7): –65 to –85 (dried substance).

Dissolve 1.000 g in 0.1 M *hydrochloric acid* and dilute to 100.0 ml with the same solvent.

B. In the conditions of the assay, protamine sulphate forms a precipitate.

C. To 0.5 ml of solution S (see Tests) add 4.5 ml of *water R*, 1.0 ml of a 100 g/l solution of *sodium hydroxide R* and 1.0 ml of a 0.2 g/l solution of α -*naphthol R* and mix. Cool the mixture to 5 °C. Add 0.5 ml of *sodium hypobromite solution R*. An intense red colour is produced.

D. Heat 2 ml of solution S in a water-bath at 60 °C and add 0.1 ml of *mercuric sulphate solution R*. Mix. No precipitate is formed. Cool the mixture in iced water. A precipitate is formed.

E. It gives reaction (a) of sulphates (2.3.1).

TESTS

Solution S. Dissolve 0.20 g in *water R* and dilute to 10.0 ml with the same solvent.

Appearance of solution. The solution is not more opalescent than reference suspension II (2.2.1) and not more intensely coloured than reference solution BY₆ or Y₆ (2.2.2, *Method II*). To 2.5 ml of solution S add 7.5 ml of *water R*.

Absorbance (2.2.25): maximum 0.1 between wavelengths of 260 nm to 280 nm.

Dilute 2.5 ml of solution S to 5.0 ml with *water R*.

Sulphate: 16 per cent to 24 per cent (dried substance).

Dissolve 0.150 g in 15 ml of *distilled water R* in a beaker. Add 5 ml of *dilute hydrochloric acid R*. Heat to boiling and slowly add to the boiling solution 10 ml of a 100 g/l solution of *barium chloride R*. Cover the beaker and heat on a water-bath for 1 h. Filter. Wash the precipitate several times with small quantities of hot *water R*. Dry and ignite the residue at 600 °C to constant mass.

1.0 g of residue is equivalent to 0.4117 g of sulphate (SO₄).

Iron (2.4.9): maximum 10 ppm.

Dissolve 1.0 g with heating in *water R* and dilute to 10 ml with the same solvent.

Mercury: maximum 10 ppm.

Introduce 2.0 g of the substance to be examined into a 250 ml ground-glass-stoppered conical flask and add 20 ml of a mixture of equal volumes of *nitric acid R* and *sulphuric acid R*. Boil under a reflux condenser for 1 h, cool and cautiously dilute with *water R*. Boil until nitrous fumes are no longer seen. Cool the solution, cautiously dilute to 200.0 ml with *water R*, mix and filter. Transfer 50.0 ml of the filtrate to a separating funnel. Shake with successive small portions of *chloroform R* until the chloroform layer remains colourless. Discard the chloroform layers. To the aqueous layer add 25 ml of *dilute sulphuric acid R*, 115 ml of *water R* and 10 ml of a 200 g/l solution of *hydroxylamine hydrochloride R*. Titrate with *dithizone solution R2*; after each addition, shake the mixture 20 times and towards the end of the titration allow to separate and discard the chloroform layer. Titrate until a bluish-green colour is obtained. Calculate the content of mercury using the equivalent in micrograms of mercury per millilitre of titrant, determined in the standardisation of the *dithizone solution R2*.

Nitrogen: 21.0 per cent to 26.0 per cent (dried substance).

Carry out the determination of nitrogen by sulphuric acid digestion (2.5.9), using 10.0 mg and heating for 3–4 h.

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test D. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32): maximum 5.0 per cent, determined on 1.000 g by drying in an oven at 100–105 °C for 3 h.

Bacterial endotoxins (2.6.14): less than 7.0 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Test solution (a). Dissolve 15.0 mg of the substance to be examined in *water R* and dilute to 100.0 ml with the same solvent.

Test solution (b). Dilute 2.0 ml of test solution (a) to 3.0 ml with *water R*.

Test solution (c). Dilute 1.0 ml of test solution (a) to 3.0 ml with *water R*.

Use as titrant a 1 to 6 dilution of *heparin sodium BRP* in *water R* (for example, 1.7 ml diluted to 10.0 ml with *water R*). Titrate each test solution in duplicate as follows: introduce an accurately measured volume of the solution to be titrated, for example 1.5 ml, into the cell of a suitable colorimeter and set the apparatus for measurement at a suitable wavelength (none is critical) in the visible range. Add the titrant in small volumes until there is a sharp increase in the absorbance and note the volume of titrant added.

Carry out 3 independent assays. For each individual titration, calculate the number of International Units of heparin in the volume of titrant added at the end-point per milligram of the substance to be examined. Calculate the potency of the substance as the average of the 18 values. Test the linearity of the response by the usual statistical methods. Calculate the 3 standard deviations for the results obtained with each of the 3 test solutions. Calculate the 3 standard deviations for the results obtained with each of the 3 independent assays. The assay is not valid unless each of the 6 standard deviations is less than 5 per cent of the average result.

STORAGE

In an airtight, tamper-proof container. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

01/2005:1144

PROTIRELIN

Protirelinum

$C_{16}H_{22}N_6O_4$

M_r 362.4

DEFINITION

5-Oxo-L-prolyl-L-histidyl-L-prolinamide.

Synthetic tripeptide with the same sequence of amino acids as the natural hypothalamic neurohormone, which stimulates the release and synthesis of thyrotropin.

Content: 97.0 per cent to 102.0 per cent (anhydrous and acetic acid-free substance).

CHARACTERS

Appearance: white or yellowish-white powder, hygroscopic.

Solubility: very soluble in water, freely soluble in methanol.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: *protirelin CRS*.

B. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with the reference solution.

TESTS

Appearance of solution. A 10 g/l solution is clear (2.2.1) and not more intensely coloured than reference solution Y_5 (2.2.2, *Method II*).

Specific optical rotation (2.2.7): -62 to -70 (anhydrous and acetic acid-free substance).

Dissolve 10 mg in 1.0 ml of *water R*.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 5.0 mg of the substance to be examined in mobile phase A and dilute to 5.0 ml with mobile phase A.

Reference solution (a). Dissolve the contents of a vial of *D-His-protirelin CRS* in an appropriate volume of mobile phase A to obtain a concentration of 1 mg/ml. Mix equal volumes of this solution and the test solution.

Reference solution (b). Dilute 0.2 ml of the test solution to 10.0 ml with mobile phase A.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.0$ mm,
- **stationary phase:** spherical *octadecylsilyl silica gel for chromatography R* (5 μ m) with a pore size of 12 nm.

Mobile phase:

- **mobile phase A:** a mixture of 100 ml of *acetonitrile for chromatography R*, 1900 ml of *water R* and 2.0 g of *sodium octanesulphonate R*, containing 2.5 ml/l of *tetraethylammonium hydroxide solution R*; adjust to pH 3.5 with *phosphoric acid R*,
- **mobile phase B:** a mixture of 300 ml of *acetonitrile for chromatography R*, 1700 ml of *water R* and 2.0 g of *sodium octanesulphonate R*, containing 2.5 ml/l of *tetraethylammonium hydroxide solution R*; adjust to pH 3.5 with *phosphoric acid R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 30	74 $\rightarrow$ 41	26 $\rightarrow$ 59
30 - 35	41 $\rightarrow$ 74	59 $\rightarrow$ 26
35 - 50	74	26

Flow rate: 1 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 10 μ l.

Relative retention with reference to protirelin (retention time = about 18 min): impurity C = about 0.2; impurity D = about 0.68; impurity A = about 0.91; impurity B = about 0.95; impurity E = about 1.08.

System suitability: reference solution (a):

- **resolution:** minimum 2.5 between the peaks due to impurity A and protirelin,
- **symmetry factor:** 0.9 to 1.2 for the peak due to protirelin.

Limits:

- **any impurity:** for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (2 per cent),
- **total:** not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3 per cent),
- **disregard limit:** 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

Acetic acid (2.5.34): maximum 2.0 per cent.

Test solution. Dissolve 40.0 mg of the substance to be examined in a mixture of 5 volumes of mobile phase B and 95 volumes of mobile phase A and dilute to 10.0 ml with the same mixture of solvents.

Water (2.5.12): maximum 7.0 per cent, determined on 0.200 g.

Bacterial endotoxins (2.6.14): less than 0.7 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modification.

Reference solution. Dissolve the contents of a vial of *protirelin CRS* in an appropriate volume of mobile phase A to obtain a concentration of 1.0 mg/ml.

Calculate the content of protirelin ($C_{16}H_{22}N_6O_4$) using the peak areas of the chromatograms obtained with the test solution and the reference solution and the declared content of $C_{16}H_{22}N_6O_4$ in *protirelin CRS*.

STORAGE

In an airtight container, protected from light at a temperature of 2 °C to 8 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states:

- the mass of peptide in the container,
- where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

Specified impurities: A, B, C, D, E.

A. 5-oxo-L-prolyl-D-histidyl-L-prolinamide,

B. 5-oxo-D-prolyl-L-histidyl-L-prolinamide,

C. 5-oxo-L-prolyl-L-histidine,

D. 5-oxo-L-prolyl-L-histidyl-L-proline,

E. (3*S*,8*aS*)-3-(1*H*-imidazol-4-ylmethyl)hexahydropyrrolo[1,2-*a*]pyrazine-1,4-dione (cyclo-(*L*-histidyl-*L*-prolyl-)).

01/2005:0526

PROXYPHYLLINE**Proxiphyllinum**

$C_{10}H_{14}N_4O_3$

M_r 238.2

DEFINITION

Proxiphylline contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 7-[(2*RS*)-2-hydroxypropyl]-1,3-dimethyl-3,7-dihydro-1*H*-purine-2,6-dione, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder, very soluble in water, soluble in alcohol.

IDENTIFICATION

First identification: B, C.

Second identification: A, C, D.

- A. Melting point (2.2.14): 134 °C to 136 °C.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *proxiphylline CRS*. Examine the substances as discs prepared using 0.5 mg to 1 mg of the substance to be examined in 0.3 g of *potassium bromide R*.
- C. Dissolve 1 g in 5 ml of *acetic anhydride R* and boil under a reflux condenser for 15 min. Allow to cool and add 100 ml of a mixture of 20 volumes of *ether R* and 80 volumes of *light petroleum R*. Cool in iced water for at least 20 min, shaking from time to time. Filter, wash the precipitate with a mixture of 20 volumes of *ether R* and 80 volumes of *light petroleum R*, recrystallise from *alcohol R* and dry *in vacuo*. The crystals melt (2.2.14) at 87 °C to 92 °C.
- D. It gives the reaction of xanthines (2.3.1).

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.25 ml of *bromothymol blue solution R1*. The solution is yellow or green. Not more than 0.4 ml of 0.01 M *sodium hydroxide* is required to change the colour of the indicator to blue.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel HF₂₅₄ R* as the coating substance.

Test solution. Dissolve 0.3 g of the substance to be examined in a mixture of 20 volumes of *water R* and 30 volumes of *methanol R* and dilute to 10 ml with the same mixture of solvents. Prepare immediately before use.

Reference solution (a). Dilute 1 ml of the test solution to 100 ml with *methanol R*.

Reference solution (b). Dilute 0.2 ml of the test solution to 100 ml with *methanol R*.

Reference solution (c). Dissolve 10 mg of *theophylline R* in *methanol R*, add 0.3 ml of the test solution and dilute to 10 ml with *methanol R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 1 volume of *concentrated ammonia R*, 10 volumes of *ethanol R* and 90 volumes of *chloroform R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (1 per cent) and at most one such spot is more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Chlorides (2.4.4). Dilute 2.5 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides (400 ppm).

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

In order to avoid overheating in the reaction medium, mix thoroughly throughout and stop the titration immediately after the end-point has been reached.

Dissolve 0.200 g in 3.0 ml of *anhydrous formic acid R* and add 50.0 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid* determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 23.82 mg of C₁₀H₁₄N₄O₃.

STORAGE

Store protected from light.

01/2005:1367
corrected

PSEUDOEPHEDRINE
HYDROCHLORIDE

Pseudoephedrini hydrochloridum

C₁₀H₁₆ClNO

M_r 201.7

DEFINITION

Pseudoephedrine hydrochloride contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (1S,2S)-2-(methylamino)-1-phenylpropan-1-ol hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder or colourless crystals, freely soluble in water and in alcohol, sparingly soluble in methylene chloride.

It melts at about 184 °C.

IDENTIFICATION

First identification: A, B, D.

Second identification: A, C, D.

A. It complies with the test for specific optical rotation (see Tests).

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *pseudoephedrine hydrochloride CRS*. Examine the substances prepared as discs.

C. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution. Dissolve 20 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 20 mg of *pseudoephedrine hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *ephedrine hydrochloride CRS* in reference solution (a) and dilute to 5 ml with the same solution.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 5 volumes of *methylene chloride R*, 15 volumes of *concentrated ammonia R* and 80 volumes of *2-propanol R*. Allow the plate to dry in air and spray with *ninhydrin solution R*. Heat at 110 °C for 5 min. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

D. Solution S (see Tests) gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 1.25 g in *carbon dioxide-free water R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. Dilute 2 ml of solution S to 10 ml with *carbon dioxide-free water R*. Add 0.1 ml of *methyl red solution R* and 0.1 ml of 0.01 M *sodium hydroxide*; the solution is yellow. Add 0.2 ml of 0.01 M *hydrochloric acid*; the solution is red.

Specific optical rotation (2.2.7): + 61.0 to + 62.5, determined on solution S and calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dissolve 20.0 mg of *ephedrine hydrochloride CRS* in the mobile phase and dilute to 20.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Reference solution (c). Dissolve 10 mg of *ephedrine hydrochloride CRS* in 5 ml of the test solution and dilute to 100 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *phenylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 6 volumes of *methanol R* and 94 volumes of a 11.6 g/l solution of *ammonium acetate R* adjusted to pH 4.0 with *glacial acetic acid R*,
- as detector a spectrophotometer set at 257 nm.

Inject 20 µl of reference solution (c). Adjust the sensitivity of the system so that the heights of the two peaks in the chromatogram obtained are at least 50 per cent of the full scale of the recorder. The test is not valid unless the resolution between the peaks corresponding to ephedrine and pseudoephedrine is at least 2.0. If necessary reduce the content of methanol in the mobile phase. Inject 20 µl of the test solution, 20 µl of reference solution (a) and 20 µl of reference solution (b). Continue the chromatography of the test solution for 1.5 times the retention time of pseudoephedrine. In the chromatogram obtained with the test solution: the area of any peak due to ephedrine is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (1 per cent); the area of any peak, apart from the principal peak and any peak due to ephedrine, is not greater than the

area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of the areas of such peaks is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent). Disregard any peak with an area less than 0.1 times that of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.170 g in 30 ml of *alcohol R*. Add 5.0 ml of 0.01 M *hydrochloric acid*. Carry out a potentiometric titration (2.2.20), using 0.1 M *sodium hydroxide*. Read the volume added between the two points of inflexion.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 20.17 mg of C₁₀H₁₆ClNO.

STORAGE

Store protected from light.

IMPURITIES

A. ephedrine.

01/2005:0858

PSYLLIUM SEED

Psyllii semen

DEFINITION

Psyllium seed consists of the ripe, whole, dry seeds of *Plantago afra* L. (*Plantago psyllium* L.) or *Plantago indica* L. (*Plantago arenaria* Waldstein and Kitaibel).

CHARACTERS

Psyllium seed has a sweet taste.

It has the macroscopic characters described under Identification.

IDENTIFICATION

P. afra seeds are light brown to very dark brown but never black, smooth and shiny having an elliptical oblong shape. They are 2 mm to 3 mm long and 0.8 mm to 1.0 mm wide, one end being wider than the other. Towards the middle of the dorsal surface there is a fairly marked transverse constriction of light colour. On the ventral surface, there is a linear lighter-coloured groove in the middle of which is a clear spot corresponding to the hilum and bounded by swollen edges.

P. indica seeds are almost identical to the seeds of *P. afra*, but a little less shiny; they are 2 mm to 3 mm long and have a maximum diameter of 1.5 mm.

TESTS

Swelling index (2.8.4). Not less than 10.

Foreign matter (2.8.2). Not more than 1.0 per cent, determined on 10.0 g of the drug, including greenish unripe seeds. Psyllium seed does not contain seeds having a dark central spot on the groove (*Plantago lanceolata* L. and *P. major* L.) or seeds with brownish-grey or pinkish outer coats (*P. ovata* Forssk. and *P. sempervirens* Crantz).

Loss on drying (2.2.32). Not more than 14.0 per cent, determined on 1.000 g of drug by drying in an oven at 100 °C to 105 °C for 2 h.

Total ash (2.4.16). Not more than 4.0 per cent.

STORAGE

Store protected from light and moisture.

01/2005:1886

PYGEUM AFRICANUM BARK

Pruni africanae cortex

DEFINITION

Whole or cut, dried bark of the stems and branches of *Prunus africana* (Hook f.) Kalkm. (syn. *Pygeum africanum* Hook f.).

CHARACTERS

Macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The dark brown to reddish-brown bark occurs in curved, hard, irregular pieces. The outer surface has a wrinkled dark reddish-brown cork with areas of adhering lichen. The reddish-brown to dark brown inner surface bears longitudinal striations. It may also occur in rolled fragments with a fibrous fracture.
- B. Reduce to a powder (355). The powder is reddish-brown. Examine under a microscope using *chloral hydrate solution R*. The powdered drug shows thick-walled sclereids, solitary or in groups; calcium oxalate cluster crystals of different size; numerous lignified fibres, thick-walled and with narrow lumen, some of them solitary and most in groups with forked ends; fragments of pigmented polygonal cells of reddish-brown colour; fragments of cork. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*, the powder shows some isolated small starch grains that stain bluish-black against *iodine solution R1*.
- C. Thin-layer chromatography (2.2.27).

Test solution. Extract 15.0 g of powdered drug (250) with *methylene chloride R* for 30 min in a continuous extraction apparatus (Soxhlet type). Filter. Evaporate the solvent to dryness under reduced pressure. Dissolve the residue in 1 ml of *methylene chloride R*.

Reference solution. Dissolve 20 mg of β -sitosterol *R* and 20 mg of ursolic acid *R* in 10 ml of a mixture of equal volumes of *methanol R* and *methylene chloride R*.

Plate: TLC silica gel plate *R*.

Mobile phase: *methanol R*, *methylene chloride R* (10:90 *V/V*).

Application: 10 μ l, as 1 cm bands.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with *vanillin reagent R*. Heat the plate at 100-105 °C for 10 min and allow to cool; examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A violet zone Several weak violet, blue or grey zones
β -Sitosterol: a violet zone Ursolic acid: a blue zone	A violet zone (β -sitosterol) A blue zone (ursolic acid) Several weak violet, blue or grey zones
	A violet zone (β -sitosterol glucoside)
Reference solution	Test solution

TESTS

Foreign matter (2.8.2): maximum 3.0 per cent.

Loss on drying (2.2.32): maximum 12.0 per cent, determined on 1.000 g of powdered drug (355) by drying in an oven at 100-105 °C for 2 h.

Total ash (2.4.16): maximum 10.0 per cent.

Extractable matter: minimum 0.5 per cent.

Extract 20.0 g of the powdered drug (250) with *methylene chloride R* for 4 h in a continuous extraction apparatus (Soxhlet type). Evaporate the solution to dryness on a water-bath *in vacuo* and then dry the residue at 80 °C for 2 h. The residue weighs a minimum of 0.10 g.

01/2005:1680

PYRANTEL EMBONATE

Pyranteli embonas

C₃₄H₃₀N₂O₆SM_r 594.7

DEFINITION

1-Methyl-2-[(*E*)-2-(thiophen-2-yl)ethenyl]-1,4,5,6-tetrahydropyrimidine hydrogen 4,4'-methylenebis(3-hydroxynaphthalene-2-carboxylate).

Content: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: pale yellow or yellow powder.

Solubility: practically insoluble in water, soluble in dimethyl sulphoxide, practically insoluble in methanol.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: *pyrantel embonate CRS*.

TESTS

Related substances. Liquid chromatography (2.2.29).

Prepare the solutions immediately before use and strictly protect from light at all stages.

Solvent mixture. Mix 5 volumes of *glacial acetic R* with 5 volumes of *water R* and add 2 volumes of *diethylamine R* with cooling.

Test solution. Dissolve 80 mg in 7 ml of the solvent mixture and dilute to 100.0 ml with *acetonitrile R*.

Reference solution (a). Dissolve 10.0 mg of *pyrantel impurity A CRS* in the solvent mixture, add 2.5 ml of the test solution and dilute to 50.0 ml with the solvent mixture. Dilute 2.0 ml of this solution to 100.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** *silica gel for chromatography R* (5 μ m).

Mobile phase: solvent mixture, *acetonitrile for chromatography R* (72:928 V/V).

Flow rate: 1 ml/min.

Detection: spectrophotometer at 288 nm.

Injection: 20 μ l.

Run time: 4 times the retention time of pyrantel.

Relative retention with reference to pyrantel (retention time = about 11 min): embonic acid = about 0.5; impurity A = about 1.3; impurity B = about 1.8 (impurity A also gives rise to an embonate peak).

System suitability: reference solution (a):

- **resolution:** minimum 4.0 between the peaks due to pyrantel and impurity A.

Limits:

- **correction factor:** for the calculation of content, multiply the peak area of impurity B by 0.4,
- **impurity A:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- **impurity B:** not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),
- **any other impurity:** for each impurity, not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- **sum of impurities other than A and B:** not more than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent),
- **disregard limit:** 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Chlorides (2.4.4): maximum 360 ppm.

To 0.46 g add 10 ml of *dilute nitric acid R* and 30 ml of *water R*. Heat on a water-bath for 5 min. Cool, dilute to 50 ml with *water R*, mix well and filter. 15 ml complies with the limit test for chlorides.

Sulphates (2.4.13): maximum 0.1 per cent.

To 0.50 g add 2.5 ml of *dilute nitric acid R* and dilute to 50 ml with *distilled water R*. Heat on a water-bath for 5 min, shake for 2 min, cool and filter. 15 ml complies with the limit test for sulphates.

Iron (2.4.9): maximum 75 ppm.

Ignite 0.66 g at 800 °C for 2 h. Dissolve the residue in 2.5 ml of *dilute hydrochloric acid R* with gentle heating for 10 min. Cool and dilute to 50 ml with *water R*. 10 ml complies with the limit test for iron.

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test D. Prepare the reference solution using 2.0 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32): maximum 1.0 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C for 3 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

To 0.450 g add 10 ml of *acetic anhydride R* and 50 ml *glacial acetic acid R*, heat at 50 °C and stir for 10 min. Allow to cool (a clear solution is not obtained). Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20). Carry out a blank titration. 1 ml of 0.1 M *perchloric acid* is equivalent to 59.47 mg of $C_{34}H_{30}N_2O_6S$.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B.

A. 1-methyl-2-[(Z)-2-(thiophen-2-yl)ethenyl]-1,4,5,6-tetrahydropyrimidine,

B. (E)-N-[3-(methylamino)propyl]-3-(thiophen-2-yl)prop-2-enamide.

01/2005:0859

PYRAZINAMIDE

Pyrazinamidum

$C_5H_5N_3O$

M_r 123.1

DEFINITION

Pyrazinamide contains not less than 99.0 per cent and not more than the equivalent of 100.5 per cent of pyrazine-2-carboxamide, calculated with reference to the anhydrous substance.

CHARACTERS

A white, crystalline powder, sparingly soluble in water, slightly soluble in alcohol and in methylene chloride.

IDENTIFICATION

First identification: C.

Second identification: A, B, D.

A. Melting point (2.2.14): 188 °C to 191 °C.

- B. Dissolve 50.0 mg in *water R* and dilute to 100.0 ml with the same solvent (solution (a)). Dilute 1.0 ml of solution (a) to 10.0 ml with *water R*. Examined between 290 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 310 nm. Dilute 2.0 ml of solution (a) to 100.0 ml with *water R*. Examined between 230 nm and 290 nm, the solution shows an absorption maximum at 268 nm. The specific absorbance at the maximum is 640 to 680.
- C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *pyrazinamide CRS*. Examine the substances prepared as discs. If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in *alcohol R*, evaporate to dryness and record new spectra using the residues.
- D. Dissolve 0.1 g in 5 ml of *water R*. Add 1 ml of *ferrous sulphate solution R2*. The solution becomes orange. Add 1 ml of *dilute sodium hydroxide solution R*. The solution becomes dark blue.

TESTS

Solution S. Dissolve 0.5 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 25 ml of solution S add 0.05 ml of *phenolphthalein solution R1* and 0.2 ml of *0.01 M sodium hydroxide*. The solution is red. Add 1.0 ml of *0.01 M hydrochloric acid*. The solution is colourless. Add 0.15 ml of *methyl red solution R*. The solution is red.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 0.1 g of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dilute 1 ml of the test solution to 50 ml with a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R*. Dilute 1 ml of the solution to 10 ml with a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R*.

Reference solution (b). Dissolve 10 mg of *nicotinic acid CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R*, add 1 ml of the test solution and dilute to 10 ml with the same mixture of solvents.

Apply separately to the plate 20 µl of each solution. Develop over a path of 10 cm using a mixture of 20 volumes of *glacial acetic acid R*, 20 volumes of *water R* and 60 volumes of *butanol R*. Allow the plate to dry in air and examine immediately in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.2 per cent). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated principal spots.

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 1 ml of *lead standard solution (10 ppm Pb) R*.

Water (2.5.12). Not more than 0.5 per cent, determined on 2.00 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in 50 ml of *acetic anhydride R*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of *0.1 M perchloric acid* is equivalent to 12.31 mg of $C_9H_{13}BrN_2O_2$.

IMPURITIES

A. pyrazine-2-carboxylic acid.

01/2005:1255

PYRIDOSTIGMINE BROMIDE

Pyridostigmini bromidum

 $C_9H_{13}BrN_2O_2$ M_r 261.1

DEFINITION

Pyridostigmine bromide contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 3-(dimethylcarbamoyloxy)-1-methylpyridinium bromide, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline, deliquescent powder, very soluble in water and in alcohol.

IDENTIFICATION

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *pyridostigmine bromide CRS*.
- B. It gives reaction (a) of bromides (2.3.1).

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 40 ml of solution S add a few drops of *methyl red solution R*. To 20 ml of this solution add 0.2 ml of *0.02 M sodium hydroxide*. The solution is yellow. To the other 20 ml add 0.2 ml of *0.02 M hydrochloric acid*. The solution is red.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 50 mg of the substance to be examined in the mobile phase at about 40 °C. Allow to cool and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dissolve 4 mg of *pyridostigmine impurity A CRS* and 4 mg of *pyridostigmine bromide CRS* in the mobile phase and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 10.0 ml to 50.0 ml with the mobile phase.

Reference solution (c). Dilute 5.0 ml of reference solution (b) to 20.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.0 mm in internal diameter packed with *base-deactivated octadecylsilyl silica gel for chromatography R* (5 µm to 10 µm),
- as mobile phase at a flow rate of 1.1 ml/min a mixture of 30 volumes of *acetonitrile R* and 70 volumes of a 4.33 g/l solution of *sodium dodecyl sulphate R*, previously adjusted to pH 2.0 with *phosphoric acid R*,
- as detector a spectrophotometer set at 220 nm.

Inject 20 µl of reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained is at least 50 per cent of the full scale of the recorder. Inject 20 µl of reference solution (a). The test is not valid unless in the chromatogram obtained, the resolution between the peaks due to pyridostigmine and pyridostigmine impurity A is at least 1.5. Inject separately 20 µl of the test solution, 20 µl of reference solution (b) and 20 µl of reference solution (c). Continue the chromatography for twice the retention time of pyridostigmine. In the chromatogram obtained with the test solution: the area of any peak apart from the principal peak is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent), at most one such peak has an area greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and at most one further peak has an area greater than half of the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent); the sum of the area of all of the peaks apart from the principal peak is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Disregard any peak due to the solvent and any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (c).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.230 g in 10 ml of *anhydrous acetic acid R*. Add 40 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20). 1 ml of 0.1 M *perchloric acid* is equivalent to 26.11 mg of C₉H₁₃BrN₂O₂.

STORAGE

Store in an airtight container, protected from light. If the substance is sterile, store in a sterile, airtight, tamper-proof container, protected from light.

IMPURITIES

A. pyridin-3-yl dimethylcarbamate,

B. 3-hydroxy-1-methylpyridinium.

01/2005:0245

PYRIDOXINE HYDROCHLORIDE

Pyridoxini hydrochloridum

C₈H₁₂ClNO₃

M_r 205.6

DEFINITION

Pyridoxine hydrochloride contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (5-hydroxy-6-methylpyridine-3,4-diyl)dimethanol hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, freely soluble in water, slightly soluble in alcohol.

It melts at about 205 °C, with decomposition.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

- Dilute 1.0 ml of solution S (see Tests) to 50.0 ml with 0.1 M *hydrochloric acid* (solution A). Dilute 1.0 ml of solution A to 100.0 ml with 0.1 M *hydrochloric acid*. Examined between 250 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 288 nm to 296 nm. The specific absorbance at the maximum is 425 to 445. Dilute 1.0 ml of solution A to 100.0 ml with a mixture of equal volumes of 0.025 M *potassium dihydrogen phosphate solution* and 0.025 M *disodium hydrogen phosphate solution* (2.2.3). Examined between 220 nm and 350 nm, the solution shows 2 absorption maxima, at 248 nm to 256 nm and at 320 nm to 327 nm. The specific absorbances at the maxima are 175 to 195 and 345 to 365, respectively.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *pyridoxine hydrochloride CRS*.
- Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- Solution S gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 2.50 g in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₇ (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 2.4 to 3.0.

Related substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel G plate R*.

Test solution (a). Dissolve 1.0 g of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *water R*.

Reference solution (a). Dissolve 0.10 g of *pyridoxine hydrochloride CRS* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 2.5 ml of test solution (a) to 100 ml with *water R*. Dilute 1 ml of this solution to 10 ml with *water R*.

Apply to the plate 2 µl of each solution. Develop in an unsaturated tank over a path of 15 cm using a mixture of 9 volumes of *concentrated ammonia R*, 13 volumes of *methylene chloride R*, 13 volumes of *tetrahydrofuran R* and 65 volumes of *acetone R*. Allow the plate to dry in air and spray with a 50 g/l solution of *sodium carbonate R* in a mixture of 30 volumes of *alcohol R* and 70 volumes of *water R*. Dry the plate in a current of air, spray with a 1 g/l solution of *dichloroquinonechlorimide R* in *alcohol R* and examine the chromatograms immediately. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.25 per cent). Disregard any spots remaining on the starting line.

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A (20 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

In order to avoid overheating in the reaction medium, mix thoroughly throughout and stop the titration immediately after the end-point has been reached.

Dissolve 0.150 g in 5 ml of *anhydrous formic acid R*. Add 50 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20). Carry out a blank titration.

1 ml of 0.1 M *perchloric acid* is equivalent to 20.56 mg of C₈H₁₂ClNO₃.

STORAGE

Store protected from light.

IMPURITIES

A. 6-methyl-1,3-dihydrofuro[3,4-c]pyridin-7-ol,

B. 5-(hydroxymethyl)-2,4-dimethylpyridin-3-ol.

PYRIMETHAMINE

Pyrimethaminum

C₁₂H₁₃ClN₄

M_r 248.7

DEFINITION

Pyrimethamine contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 5-(4-chlorophenyl)-6-ethylpyrimidine-2,4-diamine, calculated with reference to the dried substance.

CHARACTERS

An almost white, crystalline powder or colourless crystals, practically insoluble in water, slightly soluble in alcohol.

IDENTIFICATION

First identification: C.

Second identification: A, B, D.

A. Melting point (2.2.14): 239 °C to 243 °C.

B. Dissolve 0.14 g in *ethanol R* and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml of this solution to 100.0 ml with 0.1 M *hydrochloric acid*. Dilute 10.0 ml of this solution to 100.0 ml with 0.1 M *hydrochloric acid*. Examined between 250 nm and 300 nm (2.2.25), the solution shows an absorption maximum at 272 nm and an absorption minimum at 261 nm. The specific absorbance at the maximum is 310 to 330.

C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *pyrimethamine CRS*.

D. Examine the chromatograms obtained in the test for related substances in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

Solution S. Shake 1.0 g with 50 ml of *distilled water R* for 2 min and filter.

Appearance of solution. Prepare the solution immediately before use.

Dissolve 0.25 g in a mixture of 1 volume of *methanol R* and 3 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents. The solution is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, Method II).

Acidity or alkalinity. To 10 ml of solution S add 0.05 ml of *phenolphthalein solution R1*. The solution is colourless. Not more than 0.2 ml of 0.01 M *sodium hydroxide* is required to change the colour of the indicator to pink. Add 0.4 ml of 0.01 M *hydrochloric acid* and 0.05 ml of *methyl red solution R*. The solution is red or orange.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance. Prepare the solutions immediately before use.

Test solution (a). Dissolve 0.25 g of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *chloroform R* and dilute to 25 ml with the same mixture of solvents.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with a mixture of 1 volume of *methanol R* and 9 volumes of *chloroform R*.

Reference solution (a). Dissolve 0.1 g of *pyrimethamine CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *chloroform R* and dilute to 100 ml with the same mixture of solvents.

Reference solution (b). Dilute 2.5 ml of test solution (a) to 100 ml with a mixture of 1 volume of *methanol R* and 9 volumes of *chloroform R*. Dilute 1 ml of the solution to 10 ml with a mixture of 1 volume of *methanol R* and 9 volumes of *chloroform R*.

Apply to the plate 20 µl of each solution. Develop over a path of 10 cm using a mixture of 4 volumes of *chloroform R*, 8 volumes of *propanol R*, 12 volumes of *glacial acetic acid R* and 76 volumes of *toluene R*. Allow the plate to dry in air. Examine in ultraviolet light at 254 nm. Any spot in the

chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.25 per cent).

Sulphates (2.4.13). 15 ml of solution S complies with the limit test for sulphates (80 ppm). Prepare the standard using a mixture of 2.5 ml of *sulphate standard solution (10 ppm SO₄) R* and 12.5 ml of *distilled water R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 0.50 g by drying in an oven at 100 °C to 105 °C for 4 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 25 ml of *anhydrous acetic acid R*, heating gently. Cool. Titrate with 0.1 M *perchloric acid* determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 24.87 mg of C₁₂H₁₃ClN₄.

STORAGE

Store protected from light.

01/2005:0017 **Appearance of solution.** Solution S is clear (2.2.1) and not more intensely coloured than reference solution GY₆ (2.2.2, Method II).

QUINIDINE SULPHATE

Chinidini sulfas

$C_{40}H_{50}N_4O_8S \cdot 2H_2O$

M_r 783

DEFINITION

Quinidine sulphate contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of alkaloid monosulphates, calculated as bis[(S)-[(2R,4S,5R)-5-ethenyl-1-azabicyclo[2.2.2]oct-2-yl](6-methoxyquinolin-4-yl)methanol] sulphate, with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder or silky, colourless needles, slightly soluble in water, soluble in boiling water and in alcohol, practically insoluble in acetone.

IDENTIFICATION

- A. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel G plate R*.

Test solution. Dissolve 0.10 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 0.10 g of *quinidine sulphate CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *diethylamine R*, 24 volumes of *ether R* and 40 volumes of *toluene R*. Dry the plate in a current of air for 15 min and repeat the development. Dry the plate at 105 °C for 30 min, allow to cool and spray with *iodoplatinate reagent R*. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

- B. Dissolve about 5 mg in 5 ml of *water R*. Add 0.2 ml of *bromine water R* and 1 ml of *dilute ammonia R2*. A green colour develops.
- C. Dissolve 0.1 g in 3 ml of *dilute sulphuric acid R* and dilute to 100 ml with *water R*. When examined in ultraviolet light at 366 nm, an intense blue fluorescence appears which disappears almost completely on addition of 1 ml of *hydrochloric acid R*.
- D. Dissolve about 50 mg in 5 ml of hot *water R*, cool, add 1 ml of *silver nitrate solution R1* and stir with a glass rod. After a few minutes, a white precipitate is formed that dissolves on the addition of *dilute nitric acid R*.
- E. It gives reaction (a) of sulphates (2.3.1).
- F. It complies with the test for pH (see Tests).

TESTS

Solution S. Dissolve 0.500 g in 0.1 M *hydrochloric acid* and dilute to 25.0 ml with the same acid.

pH (2.2.3). Dissolve 0.10 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent. The pH of the solution is 6.0 to 6.8.

Specific optical rotation (2.2.7): + 275 to + 290, determined on solution S and calculated with reference to the dried substance.

Other cinchona alkaloids. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 20 mg of the substance to be examined, with gentle heating if necessary, in 5 ml of the mobile phase and dilute to 10 ml with the mobile phase.

Reference solution (a). Dissolve 20 mg of *quinine sulphate CRS*, with gentle heating if necessary, in 5 ml of the mobile phase and dilute to 10 ml with the mobile phase.

Reference solution (b). Dissolve 20 mg of *quinidine sulphate CRS*, with gentle heating if necessary, in 5 ml of the mobile phase and dilute to 10 ml with the mobile phase.

Reference solution (c). To 1 ml of reference solution (a) add 1 ml of reference solution (b).

Reference solution (d). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 50.0 ml with the mobile phase.

Reference solution (e). Dissolve 10 mg of *thiourea R* in the mobile phase and dilute to 10 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m to 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm or 10 µm),
- as mobile phase at a flow rate of 1.5 ml/min a mixture prepared as follows: dissolve 6.8 g of *potassium dihydrogen phosphate R* and 3.0 g of *hexylamine R* in 700 ml of *water R*, adjust to pH 2.8 with *dilute phosphoric acid R*, add 60 ml of *acetonitrile R* and dilute to 1000 ml with *water R*,
- as detector a spectrophotometer set at 250 nm for recording the chromatogram obtained with reference solution (e) and at 316 nm for the other solutions.

Inject 10 µl of reference solution (b) and 10 µl of reference solution (e). If necessary, adjust the concentration of acetonitrile in the mobile phase so that, in the chromatogram obtained with reference solution (b), the mass distribution factor of the peak corresponding to quinidine is 3.5 to 4.5, t_R being calculated from the peak corresponding to thiourea in the chromatogram obtained with reference solution (e).

Inject 10 µl each of reference solutions (a), (b), (c) and (d). The chromatogram obtained with reference solution (a) shows a principal peak corresponding to quinine and a peak corresponding to dihydroquinine, with a retention time relative to quinine of about 1.4. The chromatogram obtained with reference solution (b) shows a principal peak corresponding to quinidine and a peak corresponding to dihydroquinidine, with a retention time relative to quinidine of about 1.5. The chromatogram obtained with reference solution (c) shows 4 peaks corresponding to quinidine, quinine, dihydroquinidine and dihydroquinine which are identified by comparison of their retention times with those of the corresponding peaks in the chromatograms obtained with reference solutions (a) and (b).

The test is not valid unless: in the chromatogram obtained with reference solution (c), the resolution between the peaks corresponding to quinine and quinidine is at least 3.0 and the resolution between the peaks corresponding

01/2005:0018

to dihydroquinidine and quinine is at least 2.0; and the chromatogram obtained with reference solution (d) shows a principal peak with a signal-to-noise ratio of at least 4.

Inject 10 µl of the test solution and record the chromatogram for 2.5 times the retention time of the principal peak. Calculate the percentage content of related substances from the areas of the peaks in the chromatogram obtained with the test solution by the normalisation procedure, disregarding any peaks with an area less than that of the peak in the chromatogram obtained with reference solution (d). The content of dihydroquinidine is not greater than 15 per cent, the content of any related substance eluted before quinidine is not greater than 5 per cent and the content of any other related substance is not greater than 2.5 per cent.

Boron. Avoid where possible the use of glassware.

Test solution. Dissolve 1.00 g in a mixture of 0.5 ml of *hydrochloric acid R* and 4.0 ml of *water R*.

Reference solution. Dissolve 0.572 g of *boric acid R* in *water R* and dilute to 1000.0 ml with the same solvent. Dilute 5.0 ml to 100.0 ml with *water R*. To 1.0 ml of this solution add 3.0 ml of *water R* and 0.5 ml of *hydrochloric acid R*.

Blank solution. Add 0.5 ml of *hydrochloric acid R* to 4.0 ml of *water R*.

Add 3.0 ml of a 100 g/l solution of *2-ethylhexane-1,3-diol R* in *methylene chloride R* to the test solution, to the reference solution and to the blank solution and shake for 1 min. Allow to stand for 6 min. To 1.0 ml of the lower layer, add 2.0 ml of a 3.75 g/l solution of *curcumin R* in *anhydrous acetic acid R* and 0.3 ml of *sulphuric acid R*. Mix and after 20 min add 25.0 ml of *alcohol R*. Mix. The colour of the blank solution is yellow. Any red colour in the test solution is not more intense than that in the reference solution (5 ppm of B).

Loss on drying (2.2.32). 3.0 per cent to 5.0 per cent, determined on 1.000 g by drying in an oven at 130 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 20 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*, using 0.15 ml of *naphtholbenzein solution R* as indicator.

1 ml of 0.1 M *perchloric acid* is equivalent to 24.90 mg of C₂₀H₂₅ClN₂O₂·2H₂O.

STORAGE

Store protected from light.

IMPURITIES

A. quinine,

B. R = CH=CH₂, R' = H: (S)-[(2R,4S,5R)-5-ethenyl-1-azabicyclo[2.2.2]oct-2-yl](quinolin-4-yl)methanol (cinchonine),

C. R = C₂H₅, R' = OCH₃: (S)-[(2R,4S,5R)-5-ethyl-1-azabicyclo[2.2.2]oct-2-yl](6-methoxyquinolin-4-yl)methanol (dihydroquinidine).

QUININE HYDROCHLORIDE

Chinini hydrochloridum

C₂₀H₂₅ClN₂O₂·2H₂O

M_r 396.9

DEFINITION

Quinine hydrochloride contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of alkaloid monohydrochlorides, calculated as (R)-[(2S,4S,5R)-5-ethenyl-1-azabicyclo[2.2.2]oct-2-yl](6-methoxyquinolin-4-yl)methanol hydrochloride, with reference to the dried substance.

CHARACTERS

Fine, silky needles, often in clusters, colourless, soluble in water, freely soluble in alcohol.

IDENTIFICATION

A. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel G plate R*.

Test solution. Dissolve 0.10 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 0.10 g of *quinine sulphate CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *diethylamine R*, 24 volumes of *ether R* and 40 volumes of *toluene R*. Dry the plate in a current of air for 15 min and repeat the development. Dry the plate at 105 °C for 30 min, allow to cool and spray with *iodoplatinate reagent R*. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

B. Dissolve about 10 mg in *water R* and dilute to 10 ml with the same solvent. To 5 ml of the solution add 0.2 ml of *bromine water R* and 1 ml of *dilute ammonia R2*. A green colour develops.

C. Dissolve 0.1 g in 3 ml of *dilute sulphuric acid R* and dilute to 100 ml with *water R*. When examined in ultraviolet light at 366 nm, an intense blue fluorescence appears which disappears almost completely on the addition of 1 ml of *hydrochloric acid R*.

D. It gives the reactions of chlorides (2.3.1).

E. It complies with the test for pH (see Tests).

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, Method II).

pH (2.2.3). Dilute 10 ml of solution S to 20 ml with *carbon dioxide-free water R*. The pH of the solution is 6.0 to 6.8.

Specific optical rotation (2.2.7). Dissolve 0.500 g in 0.1 M *hydrochloric acid* and dilute to 25.0 ml with the same acid. The specific optical rotation is -245 to -258 , calculated with reference to the dried substance.

Other cinchona alkaloids. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 20 mg of the substance to be examined, with gentle heating if necessary, in 5 ml of the mobile phase and dilute to 10 ml with the mobile phase.

Reference solution (a). Dissolve 20 mg of *quinine sulphate CRS*, with gentle heating if necessary, in 5 ml of the mobile phase and dilute to 10 ml with the mobile phase.

Reference solution (b). Dissolve 20 mg of *quinidine sulphate CRS*, with gentle heating if necessary, in 5 ml of the mobile phase and dilute to 10 ml with the mobile phase.

Reference solution (c). To 1 ml of reference solution (a) add 1 ml of reference solution (b).

Reference solution (d). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 50.0 ml with the mobile phase.

Reference solution (e). Dissolve 10 mg of *thiourea R* in the mobile phase and dilute to 10 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m to 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 μ m or 10 μ m),
- as mobile phase at a flow rate of 1.5 ml/min a mixture prepared as follows: dissolve 6.8 g of *potassium dihydrogen phosphate R* and 3.0 g of *hexylamine R* in 700 ml of *water R*, adjust to pH 2.8 with *dilute phosphoric acid R*, add 60 ml of *acetonitrile R* and dilute to 1000 ml with *water R*,
- as detector a spectrophotometer set at 250 nm for recording the chromatogram obtained with reference solution (e) and at 316 nm for the other solutions.

Inject 10 μ l of reference solution (b) and 10 μ l of reference solution (e). If necessary, adjust the concentration of acetonitrile in the mobile phase so that, in the chromatogram obtained with reference solution (b), the mass distribution factor of the peak corresponding to quinidine is 3.5 to 4.5, t_R being calculated from the peak corresponding to thiourea in the chromatogram obtained with reference solution (e).

Inject 10 μ l each of reference solutions (a), (b), (c) and (d). The chromatogram obtained with reference solution (a) shows a principal peak corresponding to quinine and a peak corresponding to dihydroquinine, with a retention time relative to quinine of about 1.4. The chromatogram obtained with reference solution (b) shows a principal peak corresponding to quinidine and a peak corresponding to dihydroquinidine with a retention time relative to quinidine of about 1.5. The chromatogram obtained with reference solution (c) shows 4 peaks corresponding to quinidine, quinine, dihydroquinidine and dihydroquinine, which are identified by comparison of their retention times with those of the corresponding peaks in the chromatograms obtained with reference solutions (a) and (b).

The chromatographic system is not satisfactory unless in the chromatogram obtained with reference solution (c), the resolution between the peaks corresponding to quinine and quinidine is at least 3.0 and the resolution between the peaks corresponding to dihydroquinidine and quinine is at least 2.0 and the chromatogram obtained with reference solution (d) shows a principal peak with a signal-to-noise ratio of at least 4.

Inject 10 μ l of the test solution. Record the chromatograms for 2.5 times the retention time of the principal peak. Calculate the percentage content of related substances from the areas of the peaks in the chromatogram obtained with the test solution by the normalisation procedure, ignoring any peaks with an area less than that of the peak in the chromatogram obtained with reference solution (d). The content of dihydroquinine is not greater than 10 per cent, the content of any related substance eluted before quinine is not greater than 5 per cent and the content of any other related substance is not greater than 2.5 per cent.

Sulphates (2.4.13). 15 ml of solution S complies with the limit test for sulphate (500 ppm).

Barium. To 15 ml of solution S add 1 ml of *dilute sulphuric acid R*. After at least 15 min, any opalescence in the solution is not more intense than that in a mixture of 15 ml of solution S and 1 ml of *distilled water R*.

Loss on drying (2.2.32). 6.0 per cent to 10.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 50 ml of *alcohol R* and add 5.0 ml of 0.01 M *hydrochloric acid*. Titrate with 0.1 M *sodium hydroxide*, determining the end-point potentiometrically (2.2.20). Read the volume added between the 2 inflexion points.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 36.09 mg of $C_{20}H_{25}ClN_2O_2$

STORAGE

Store protected from light.

IMPURITIES

A. quinidine,

B. $R = CH=CH_2$, $R' = H$: (*R*)-[(2*S*,4*S*,5*R*)-5-ethenyl-1-azabicyclo[2.2.2]oct-2-yl](quinolin-4-yl)methanol (cinchonidine),

C. $R = C_2H_5$, $R' = OCH_3$: (*R*)-[(2*S*,4*S*,5*R*)-5-ethyl-1-azabicyclo[2.2.2]oct-2-yl](6-methoxyquinolin-4-yl)methanol (dihydroquinine).

01/2005:0019 pH (2.2.3). The pH of a 10 g/l suspension in *water R* is 5.7 to 6.6.

QUININE SULPHATE

Chinini sulfas

$C_{40}H_{50}N_4O_8S \cdot 2H_2O$

M_r 783

DEFINITION

Quinine sulphate contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of alkaloid monosulphates, calculated as bis[(*R*)-[(2*S*,4*S*,5*R*)-5-ethenyl-1-azabicyclo[2.2.2]oct-2-yl](6-methoxyquinolin-4-yl)methanol] sulphate, with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder or fine, colourless needles, slightly soluble in water, sparingly soluble in boiling water and in alcohol.

IDENTIFICATION

- A. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel G plate R*.

Test solution. Dissolve 0.10 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 0.10 g of *quinine sulphate CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *diethylamine R*, 24 volumes of *ether R* and 40 volumes of *toluene R*. Dry the plate in a current of air for 15 min and repeat the development. Dry the plate at 105 °C for 30 min, allow to cool and spray with *iodoplatinate reagent R*. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

- B. Dissolve about 5 mg in 5 ml of *water R*. Add 0.2 ml of *bromine water R* and 1 ml of *dilute ammonia R2*. A green colour develops.
- C. Dissolve 0.1 g in 3 ml of *dilute sulphuric acid R* and dilute to 100 ml with *water R*. When examined in ultraviolet light at 366 nm, an intense blue fluorescence appears which disappears almost completely on the addition of 1 ml of *hydrochloric acid R*.
- D. Dissolve about 45 mg in 5 ml of *dilute hydrochloric acid R*. The solution gives reaction (a) of sulphates (2.3.1).
- E. It complies with the test for pH (see Tests).

TESTS

Solution S. Dissolve 0.500 g in 0.1 *M* *hydrochloric acid* and dilute to 25.0 ml with the same acid.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution GY₆ (2.2.2, *Method II*).

Specific optical rotation (2.2.7). –237 to –245, determined on solution S and calculated with reference to the dried substance.

Other cinchona alkaloids. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 20 mg of the substance to be examined, with gentle heating if necessary, in 5 ml of the mobile phase and dilute to 10 ml with the mobile phase.

Reference solution (a). Dissolve 20 mg of *quinine sulphate CRS*, with gentle heating if necessary, in 5 ml of the mobile phase and dilute to 10 ml with the mobile phase.

Reference solution (b). Dissolve 20 mg of *quinidine sulphate CRS*, with gentle heating if necessary, in 5 ml of the mobile phase and dilute to 10 ml with the mobile phase.

Reference solution (c). To 1 ml of reference solution (a) add 1 ml of reference solution (b).

Reference solution (d). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 50.0 ml with the mobile phase.

Reference solution (e). Dissolve 10 mg of *thiourea R* in the mobile phase and dilute to 10 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m to 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm or 10 µm),
- as mobile phase at a flow rate of 1.5 ml/min a mixture prepared as follows: dissolve 6.8 g of *potassium dihydrogen phosphate R* and 3.0 g of *hexylamine R* in 700 ml of *water R*, adjust to pH 2.8 with *dilute phosphoric acid R*, add 60 ml of *acetonitrile R* and dilute to 1000 ml with *water R*,
- as detector a spectrophotometer set at 250 nm for recording the chromatogram obtained with reference solution (e) and at 316 nm for the other solutions.

Inject 10 µl of reference solution (b) and 10 µl of reference solution (e). If necessary, adjust the concentration of acetonitrile in the mobile phase so that, in the chromatogram obtained with reference solution (b), the mass distribution factor of the peak corresponding to quinidine is 3.5 to 4.5, t_R being calculated from the peak corresponding to thiourea in the chromatogram obtained with reference solution (e).

Inject 10 µl each of reference solutions (a), (b), (c) and (d). The chromatogram obtained with reference solution (a) shows a principal peak corresponding to quinine and a peak, corresponding to dihydroquinine, with a retention time relative to quinine of about 1.4. The chromatogram obtained with reference solution (b) shows a principal peak corresponding to quinidine and a peak, corresponding to dihydroquinidine, with a retention time relative to quinidine of about 1.5. The chromatogram obtained with reference solution (c) shows 4 peaks corresponding to quinidine, quinine, dihydroquinidine and dihydroquinine which are identified by comparison of their retention times with those of the corresponding peaks in the chromatograms obtained with reference solutions (a) and (b).

The test is not valid unless: in the chromatogram obtained with reference solution (c), the resolution between the peaks corresponding to quinine and quinidine is at least 3.0 and the resolution between the peaks corresponding to dihydroquinidine and quinine is at least 2.0; and the chromatogram obtained with reference solution (d) shows a principal peak with a signal-to-noise ratio of at least 4.

Inject 10 µl of the test solution. Record the chromatograms for 2.5 times the retention time of the principal peak. Calculate the percentage content of related substances from the areas of the peaks in the chromatogram obtained with the test solution by the normalisation procedure, disregarding any peaks with an area less than that of the peak in the chromatogram obtained with reference solution (d). The content of dihydroquinine is not greater than 10 per cent, the content of any related substance eluted before quinine is not greater than 5 per cent and the content of any other related substance is not greater than 2.5 per cent.

Loss on drying (2.2.32): 3.0 per cent to 5.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in a mixture of 10 ml of *chloroform R* and 20 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20). 1 ml of 0.1 M *perchloric acid* is equivalent to 24.90 mg of C₄₀H₅₀N₄O₈S.

STORAGE

Store protected from light.

IMPURITIES

A. quinidine,

B. R = CH=CH₂, R' = H: (*R*)-[(2*S*,4*S*,5*R*)-5-ethenyl-1-azabicyclo[2.2.2]oct-2-yl](quinolin-4-yl)methanol (cinchonidine),

C. R = C₂H₅, R' = OCH₃: (*R*)-[(2*S*,4*S*,5*R*)-5-ethyl-1-azabicyclo[2.2.2]oct-2-yl](6-methoxyquinolin-4-yl)methanol (dihydroquinine).

01/2005:1368

RAMIPRIL

Ramiprilum

 $C_{23}H_{32}N_2O_5$ M_r 416.5

DEFINITION

Ramipril contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of (2S,3aS,6aS)-1-[(S)-2-[(S)-1-(ethoxycarbonyl)-3-phenylpropyl]amino]propanoyl]octahydrocyclopenta[b]pyrrole-2-carboxylic acid, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, sparingly soluble in water, freely soluble in methanol.

IDENTIFICATION

- It complies with the test for specific optical rotation (see Tests).
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *ramipril CRS*.

TESTS

Appearance of solution. Dissolve 0.1 g in *methanol R* and dilute to 10 ml with the same solvent. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Specific optical rotation (2.2.7). Dissolve 0.250 g in a mixture of 14 volumes of *hydrochloric acid R1* and 86 volumes of *methanol R* and dilute to 25.0 ml with the same mixture of solvents. The specific optical rotation is + 32.0 to + 38.0, calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 20.0 mg of the substance to be examined in mobile phase A and dilute to 20.0 ml with the same mobile phase.

Reference solution (a). Dissolve 5 mg each of *ramipril impurity A CRS*, *ramipril impurity B CRS*, *ramipril impurity C CRS* and *ramipril impurity D CRS* in 5 ml of the test solution and dilute to 10 ml with mobile phase B.

Reference solution (b). Dilute 5.0 ml of the test solution to 100.0 ml with mobile phase B. Dilute 5.0 ml of the solution to 50.0 ml with mobile phase B.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 10.0 ml with mobile phase B.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.0 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (3 µm),
- as mobile phase at a flow rate of 1.0 ml/min:

Mobile phase A. Dissolve 2.0 g of *sodium perchlorate R* in a mixture of 0.5 ml of *triethylamine R* and 800 ml of *water R*; adjust to pH 3.6 with *phosphoric acid R* and add 200 ml of *acetonitrile R*,

Mobile phase B. Dissolve 2.0 g of *sodium perchlorate R* in a mixture of 0.5 ml of *triethylamine R* and 300 ml of *water R*; adjust to pH 2.6 with *phosphoric acid R* and add 700 ml of *acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 6	90	10	isocratic
6 - 7	90 → 75	10 → 25	linear gradient
7 - 20	75 → 65	25 → 35	linear gradient
20 - 30	65 → 25	35 → 75	linear gradient
30 - 40	25	75	isocratic
40 - 45	25 → 90	75 → 10	linear gradient
45 - 55	90	10	re-equilibration

– as detector a spectrophotometer set at 210 nm,

maintaining the temperature of the column at 65 °C.

Equilibrate the column with a mixture of 90 per cent mobile phase A and 10 per cent mobile phase B for at least 35 min. If a suitable baseline cannot be obtained, use another grade of triethylamine.

Inject 10 µl of reference solution (c). Adjust the sensitivity of the system so that the chromatogram obtained shows a visible peak. Inject 10 µl of reference solution (a), 10 µl of reference solution (b) and 10 µl of the test solution. The test is not valid unless: in the chromatogram obtained with reference solution (a) the resolution between the peaks corresponding to ramipril impurity A and ramipril is at least 3.0; in the chromatogram obtained with reference solution (c) the principal peak has a signal-to-noise ratio of at least three; and in the chromatogram obtained with the test solution, the symmetry factor of the principal peak is 0.8 to 2.0.

When the chromatograms are recorded in the prescribed conditions, the retention times are: ramipril impurity A about 14 min, ramipril about 18 min, ramipril impurity B about 22 min, toluene about 24 min, ramipril impurity C about 26 min and ramipril impurity D about 28 min.

In the chromatogram obtained with the test solution, multiply the area of any peak corresponding to ramipril impurity C by a correction factor of 2.4.

In the chromatogram obtained with the test solution: the area of each peak corresponding to ramipril impurity A, ramipril impurity B, ramipril impurity C and ramipril impurity D is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the area of any peak, apart from the principal peak and any peak corresponding to the impurities A, B, C and D, is not greater than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent); the sum of the areas of all peaks, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent). Disregard any peak with an area less than that of the principal peak in the chromatogram obtained with reference solution (c).

Palladium. Not more than 20 ppm of Pd, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dissolve 0.200 g of the substance to be examined in a mixture of 0.3 volumes of *nitric acid R* and 99.7 volumes of *water R* and dilute to 100.0 ml with the same mixture of solvents.

Reference solutions. Use solutions containing 0.02 µg, 0.03 µg and 0.05 µg of palladium per millilitre, freshly prepared by dilution of *palladium standard solution* (0.5 ppm Pd) *R* with a mixture of 0.3 volumes of *nitric acid R* and 99.7 volumes of *water R*.

Modifier solution. Dissolve 0.150 g of *magnesium nitrate R* in a mixture of 0.3 volumes of *nitric acid R* and 99.7 volumes of *water R* and dilute to 100.0 ml with the same mixture of solvents.

Inject separately 20 µl of the test solution and 20 µl of the reference solution, and 10 µl of the modifier solution. Measure the absorbance at 247.6 nm using a palladium hollow-cathode lamp as a source of radiation, a transmission band of preferably 1 nm and a graphite tube.

Loss on drying (2.2.32). Not more than 0.2 per cent, determined on 1.000 g by drying in an oven under high vacuum at 60 °C for 4 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 25 ml of *methanol R* and add 25 ml of *water R*. Titrate with 0.1 M *sodium hydroxide*, determining the end-point potentiometrically (2.2.20). Carry out a blank titration.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 41.65 mg of C₂₃H₃₂N₂O₅.

STORAGE

Store protected from light.

IMPURITIES

Specified impurities: A, B, C, D.

Other detectable impurities: E, F, G, H, I, J, K, L, M, N.

A. R = CH₃: (2*S*,3*aS*,6*aS*)-1-[(*S*)-2-[(*S*)-1-(methoxycarbonyl)-3-phenylpropyl]amino]propanoyl]octahydrocyclopenta[*b*]pyrrole-2-carboxylic acid (ramipril methyl ester),

B. R = CH(CH₃)₂: (2*S*,3*aS*,6*aS*)-1-[(*S*)-2-[(*S*)-1-[(1-methylethoxy)carbonyl]-3-phenylpropyl]amino]propanoyl]octahydrocyclopenta[*b*]pyrrole-2-carboxylic acid (ramipril isopropyl ester),

C. (2*S*,3*aS*,6*aS*)-1-[(*S*)-2-[(*S*)-3-cyclohexyl-1-(ethoxycarbonyl)propyl]amino]propanoyl]octahydrocyclopenta[*b*]pyrrole-2-carboxylic acid (hexahydroramipril),

D. ethyl (2*S*)-2-[(3*S*,5*aS*,8*aS*,9*aS*)-3-methyl-1,4-dioxodecahydro-2*H*-cyclopenta[4,5]pyrrolo[1,2-*a*]pyrazin-2-yl]-4-phenylbutanoate (ramipril diketopiperazine),

E. (2*S*,3*aS*,6*aS*)-1-[(*S*)-2-[(*S*)-1-carboxy-3-phenylpropyl]amino]propanoyl]octahydrocyclopenta[*b*]pyrrole-2-carboxylic acid (ramipril diacid),

F. (*S*)-2-[(*S*)-1-(ethoxycarbonyl)-3-phenylpropyl]amino]propanoic acid,

G. toluene,

H. (2*S*,3*aS*,6*aS*)-1-[(*R*)-2-[(*S*)-1-(ethoxycarbonyl)-3-phenylpropyl]amino]propanoyl]octahydrocyclopenta[*b*]pyrrole-2-carboxylic acid ((*R,S,S,S*) isomer of ramipril),

I. (2*S*,3*aS*,6*aS*)-1-[(*S*)-2-[(*R*)-1-(ethoxycarbonyl)-3-phenylpropyl]amino]propanoyl]octahydrocyclopenta[*b*]pyrrole-2-carboxylic acid ((*S,R,S,S*) isomer of ramipril),

01/2005:0946

- J. (2*R*,3*aR*,6*aR*)-1-[(*R*)-2-[(*R*)-1-(ethoxycarbonyl)-3-phenylpropyl]amino]propanoyl]octahydrocyclopenta[*b*]pyrrole-2-carboxylic acid ((*R*,*R*,*R*,*R*) isomer of ramipril),

- K. (2*S*)-2-[(3*S*,5*aS*,8*aS*,9*aS*)-3-methyl-1,4-dioxodecahydro-2*H*-cyclopenta[4,5]pyrrolo[1,2-*a*]pyrazin-2-yl]-4-phenylbutanoic acid (ramipril diketopiperazine acid),

- L. ethyl (2*S*)-2-[(3*S*,5*aS*,8*aS*,9*aS*)-9*a*-hydroxy-3-methyl-1,4-dioxodecahydro-2*H*-cyclopenta[4,5]pyrrolo[1,2-*a*]pyrazin-2-yl]-4-phenylbutanoate (ramipril hydroxydiketopiperazine),

- M. (2*R*,3*R*)-2,3-di(benzoyloxy)butanedioic acid (dibenzoyltartric acid),

- N. (2*R*,3*aR*,6*aR*)-1-[(*S*)-2-[(*S*)-1-(ethoxycarbonyl)-3-phenylpropyl]amino]propanoyl]octahydrocyclopenta[*b*]pyrrole-2-carboxylic acid ((*S*,*S*-*R*,*R*,*R*) isomer of ramipril).

RANITIDINE HYDROCHLORIDE

Ranitidini hydrochloridum

C₁₃H₂₃ClN₄O₃S*M*_r 350.9

DEFINITION

Ranitidine hydrochloride contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of *N*-[2-[[[5-[(dimethylamino)methyl]furan-2-yl]methyl]sulphonyl]ethyl]-*N'*-methyl-2-nitroethene-1,1-diamine hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or pale yellow, crystalline powder, freely soluble in water and in methanol, sparingly soluble in ethanol, very slightly soluble in methylene chloride.

It shows polymorphism.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

- Dissolve 10 mg in *water R* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of the solution to 50.0 ml with *water R*. Examined between 220 nm and 360 nm (2.2.25), the solution shows two absorption maxima, at 229 nm and 315 nm. The ratio of the absorbance measured at the maximum at 229 nm to that measured at the maximum at 315 nm is 1.01 to 1.07.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *ranitidine hydrochloride CRS*. Examine the substances as mulls in *liquid paraffin R*. If the spectra show differences, dissolve 20 mg of the substance to be examined and 20 mg of the reference substance separately in 5 ml of *methanol R*. Evaporate to dryness in a water-bath at 40 °C under reduced pressure and with constant stirring. Dry the residues under high vacuum at 60 °C for 1 h and record new spectra using the residues.
- Examine the chromatograms obtained in the test for related substances (see Tests). The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 100.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₅ (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 4.5 to 6.0.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution (a). Dissolve 0.50 g of the substance to be examined in *methanol R* and dilute to 25 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methanol R*.

Reference solution (a). Dissolve 20 mg of *ranitidine hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 3.0 ml of test solution (b) to 100 ml with *methanol R*.

Reference solution (c). Dilute 2.0 ml of test solution (b) to 100 ml with *methanol R*.

Reference solution (d). Dilute 1.0 ml of test solution (b) to 100 ml with *methanol R*.

Reference solution (e). Dilute 0.5 ml of test solution (b) to 100 ml with *methanol R*.

Reference solution (f). Dissolve 10 mg of *ranitidine impurity A CRS* in *methanol R* and dilute to 100 ml with the same solvent.

Reference solution (g). Dissolve 10 mg of *ranitidine impurity B CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (h). Dissolve 10 mg of *ranitidine impurity B CRS* in test solution (a) and dilute to 10 ml with the same solution.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 2 volumes of *water R*, 4 volumes of *concentrated ammonia R1*, 15 volumes of *2-propanol R* and 25 volumes of *ethyl acetate R*. Allow the plate to dry in air and expose to iodine vapour until the spots are clearly visible. Examine in daylight. In the chromatogram obtained with test solution (a): any spot corresponding to ranitidine impurity A is not more intense than the spot in the chromatogram obtained with reference solution (f) (0.5 per cent); any spot apart from the principal spot and any spot corresponding to ranitidine impurity A is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.3 per cent); at most three such spots are more intense than the spot in the chromatogram obtained with reference solution (d) (0.1 per cent) and at most one of these is more intense than the spot in the chromatogram obtained with reference solution (c) (0.2 per cent). The test is not valid unless the chromatogram obtained with reference solution (h) shows two clearly separated spots, corresponding to ranitidine impurity B (whose R_f value is obtained from the chromatogram obtained with reference solution (g)) and ranitidine, and the chromatogram obtained with reference solution (e) shows a clearly visible spot.

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.75 per cent, determined on 1.000 g by drying under high vacuum at 60 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.280 g in 35 ml of *water R*. Titrate with 0.1 M *sodium hydroxide*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *sodium hydroxide* is equivalent to 35.09 mg of $C_{13}H_{23}ClN_4O_3S$.

STORAGE

Store in an airtight container, protected from light.

IMPURITIES

A. *N,N'*-bis[2-[[[5-[(dimethylamino)methyl]furan-2-yl]methyl]sulphonyl]ethyl]-2-nitroethene-1,1-diamine,

B. $R = S-CH_2-CH_2-NH_2$: 2-[[[5-[(dimethylamino)methyl]furan-2-yl]methyl]sulphonyl]ethanamine,

D. $R = S-CH_2-CH_2-NH-CO-CH_2-NO_2$: *N*-[2-[[[5-[(dimethylamino)methyl]furan-2-yl]methyl]sulphonyl]ethyl]-2-nitroacetamide,

F. $R = OH$: [5-[(dimethylamino)methyl]furan-2-yl]methanol,

C. *N*-[2-[[[5-[(dimethylamino)methyl]furan-2-yl]methyl]sulphanyl]ethyl]-*N'*-methyl-2-nitroethene-1,1-diamine,

E. *N,N*-dimethyl[5-[[[2-[1-(methylamino)-2-nitroethenyl]amino]ethyl]sulphonyl]methyl]furan-2-yl]methanamine *N*-oxide,

G. 3-(methylamino)-5,6-dihydro-2H-1,4-thiazin-2-one oxime,

H. *N*-methyl-2-nitroacetamide.

01/2005:1369 IDENTIFICATION

RAPESEED OIL, REFINED

Rapae oleum raffinatum

DEFINITION

Refined rapeseed oil is the fatty oil obtained from the seeds of *Brassica napus* L. and *Brassica campestris* L. by mechanical expression or by extraction. It is then refined. A suitable antioxidant may be added.

CHARACTERS

A clear, light yellow liquid, practically insoluble in water and in alcohol, miscible with light petroleum (bp: 40 °C to 60 °C).
It has a relative density of about 0.917 and a refractive index of about 1.473.

IDENTIFICATION

Carry out the identification of fatty oils by thin-layer chromatography (2.3.2). The chromatogram obtained is similar to the typical chromatogram for rapeseed oil.

TESTS

- Acid value** (2.5.1). Not more than 0.5, determined on 10.0 g.
- Peroxide value** (2.5.5). Not more than 10.0.
- Unsaponifiable matter** (2.5.7). Not more than 1.5 per cent, determined on 5.0 g.
- Alkaline impurities** (2.4.19). It complies with the test for alkaline impurities in fatty oils.
- Composition of fatty acids** (2.4.22, Method A). The fatty acid fraction of the oil has the following composition:
- *palmitic acid*: 2.5 per cent to 6.0 per cent,
 - *stearic acid*: not more than 3.0 per cent,
 - *oleic acid*: 50.0 per cent to 67.0 per cent,
 - *linoleic acid*: 16.0 per cent to 30.0 per cent,
 - *linolenic acid*: 6.0 per cent to 14.0 per cent,
 - *eicosenoic acid*: not more than 5.0 per cent,
 - *erucic acid*: not more than 2.0 per cent.

STORAGE

Store in an airtight, well-filled container, protected from light.

LABELLING

- The label states:
- the name and concentration of any added antioxidant,
 - whether the oil is obtained by mechanical expression or by extraction.

- A. The petal is dark red to dark violet-brown, very thin, floppy, wrinkled, often crumpled into a ball and velvety to the touch. It is broadly ovate with an entire margin, about 6 cm long and 4 cm to 6 cm wide, narrowing at the base where there is a black spot. The vascular bundles radiate from the base and they anastomose in a continuous arc, all at the same short distance from the margin.
- B. Reduce to a powder (355). Examine under a microscope using *chloral hydrate solution R*. The powder is an intense reddish-pink and shows fragments of epidermis composed of elongated, sinuous-walled cells with small, rounded, anomocytic stomata (2.8.3), numerous vascular bundles with spiral vessels embedded in the parenchyma; occasional fragments of the fibrous layer of the anthers; rounded pollen grains, about 30 µm in diameter, with 3 pores and a finely verrucose exine.
- C. Thin-layer chromatography (2.2.27).
Test solution. To 1.0 g of the powdered drug (355) add 10 ml of *alcohol (60 per cent V/V) R*. Stir for 15 min. Filter through a filter paper.
Reference solution. Dissolve 1 mg of *quinaldine red R* and 1 mg of *sulphan blue R* in 2 ml of *methanol R*.
Plate: TLC silica gel plate R.
Mobile phase: *anhydrous formic acid R, water R, butanol R* (10:12:40 V/V/V).
Application: 10 µl, as bands.
Development: over a path of 10 cm.
Drying: in air.
Detection: examine in daylight.
Results: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other bands may be present in the chromatogram obtained with the test solution.

Top of the plate	
Quinaldine red: an orange-red zone	2 yellow zones
Sulphan blue: a blue zone	A violet principal zone A violet zone A yellow zone
	A compact group of violet zones
Reference solution	Test solution

TESTS

- Foreign matter** (2.8.2): maximum 2.0 per cent of capsules and maximum 1.0 per cent of other foreign matter.
- Loss on drying** (2.2.32): maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100-105 °C for 2 h.
- Total ash** (2.4.16): maximum 11.0 per cent.
- Colouring capacity.** Place 1.0 g of the powdered drug (355) in a 250 ml flask and add 100 ml of *ethanol (30 per cent V/V) R*. Allow to macerate for 4 h with frequent stirring. Filter and discard the first 10 ml. Transfer 10.0 ml of the filtrate to a 100 ml volumetric flask and add 2 ml of *hydrochloric acid R*. Dilute to 100.0 ml with *ethanol (30 per*

01/2005:1881

RED POPPY PETALS

Papaveris rhoeados flos

DEFINITION

Dried, whole or fragmented petals of *Papaver rhoeas* L.

CHARACTERS

Macroscopic and microscopic characters described under identification tests A and B.

cent V/V) *R*. Allow to stand for 10 min. The absorbance (2.2.25) measured at 523 nm using *ethanol* (30 per cent V/V) *R* as compensation liquid is not less than 0.6.

01/2005:0528

RESERPINE

Reserpinum

C₃₃H₄₀N₂O₉M_r 609

DEFINITION

Reserpine contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of total alkaloids and not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of methyl 11,17-α-dimethoxy-18β-[(3,4,5-trimethoxybenzoyl)oxy]-3β,20α-yohimban-16β-carboxylate, both calculated with reference to the dried substance.

CHARACTERS

A crystalline powder or small, white to slightly yellow crystals, darkening slowly on exposure to light, practically insoluble in water, very slightly soluble in alcohol.

IDENTIFICATION

First identification: B.

Second identification: A, C, D, E.

- Dissolve 20.0 mg in *chloroform R* and dilute to 10.0 ml with the same solvent. Dilute 1.0 ml of this solution to 100.0 ml with *alcohol R*. Examined immediately between 230 nm and 350 nm (2.2.25), the solution shows a maximum at 268 nm. The specific absorbance at the maximum is 265 to 285. Over the range 288 nm to 295 nm, the curve shows a slight absorption minimum followed by a shoulder or a slight absorption maximum; over this range, the specific absorbance is about 170.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *reserpine CRS*. Examine the substances prepared as discs.
- To about 1 mg add 0.1 ml of a 1 g/l solution of *sodium molybdate R* in *sulphuric acid R*. A yellow colour is produced which becomes blue within 2 min.
- To about 1 mg add 0.2 ml of a freshly prepared 10 g/l solution of *vanillin R* in *hydrochloric acid R*. A pink colour develops within 2 min.
- Mix about 0.5 mg with 5 mg of *dimethylaminobenzaldehyde R* and 0.2 ml of *glacial acetic acid R* and add 0.2 ml of *sulphuric acid R*. A green colour is produced. Add 1 ml of *glacial acetic acid R*. The colour becomes red.

TESTS

Specific optical rotation (2.2.7). Carry out the determination immediately after preparing the solution. Dissolve 0.250 g in *chloroform R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is –116 to –128, calculated with reference to the dried substance.

Oxidation products. Dissolve 20 mg in *glacial acetic acid R* and dilute to 100.0 ml with the same acid. The absorbance (2.2.25) measured immediately at 388 nm is not greater than 0.10.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 0.500 g by drying at 60 °C over *diphosphorus pentoxide R* at a pressure not exceeding 667 Pa for 3 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 0.5 g.

ASSAY

Total alkaloids. Dissolve 0.500 g in a mixture of 6 ml of *acetic anhydride R* and 40 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 60.9 mg of total alkaloids.

Reserpine. Protect the solutions from light. Moisten 25.0 mg with 2 ml of *alcohol R*, add 2 ml of 0.25 M *sulphuric acid* and 10 ml of *alcohol R*, and warm gently to effect solution. Cool and dilute to 100.0 ml with *alcohol R*. Dilute 5.0 ml of this solution to 50.0 ml with *alcohol R*. Prepare a reference solution in the same manner using 25.0 mg of *reserpine CRS*. Place 10.0 ml of each solution separately in two boiling-tubes, add 2.0 ml of 0.25 M *sulphuric acid* and 2.0 ml of a freshly prepared 3 g/l solution of *sodium nitrite R*. Mix and heat in a water-bath at 55 °C for 35 min. Cool, add 1.0 ml of a freshly prepared 50 g/l solution of *sulphamic acid R* and dilute to 25.0 ml with *alcohol R*. Measure the absorbance (2.2.25) of each solution at the maximum at 388 nm, using as the compensation liquid 10.0 ml of the same solution treated at the same time in the same manner, but omitting the sodium nitrite.

Calculate the content of C₃₃H₄₀N₂O₉ from the absorbances measured and the concentrations of the solutions.

STORAGE

Store protected from light.

01/2005:0290

RESORCINOL

Resorcinolum

C₆H₆O₂M_r 110.1

DEFINITION

Resorcinol contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of benzene-1,3-diol, calculated with reference to the dried substance.

CHARACTERS

A colourless or slightly pinkish-grey, crystalline powder or crystals, turning red on exposure to light and air, very soluble in water and in alcohol.

IDENTIFICATION

01/2005:1879

- A. Melting point (2.2.14): 109 °C to 112 °C.
- B. Dissolve 0.1 g in 1 ml of *water R*, add 1 ml of *strong sodium hydroxide solution R* and 0.1 ml of *chloroform R*, heat and allow to cool. An intense, deep-red colour develops which becomes pale yellow on the addition of a slight excess of *hydrochloric acid R*.
- C. Thoroughly mix about 10 mg with about 10 mg of *potassium hydrogen phthalate R*, both finely powdered. Heat over a naked flame until an orange-yellow colour is obtained. Cool and add 1 ml of *dilute sodium hydroxide solution R* and 10 ml of *water R* and shake to dissolve. The solution shows an intense green fluorescence.

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution B₅ or R₅ (2.2.2, *Method II*) and remains so when heated in a water-bath for 5 min.

Acidity or alkalinity. To 10 ml of solution S add 0.05 ml of *bromophenol blue solution R2*. Not more than 0.05 ml of 0.1 M *hydrochloric acid* or 0.1 M *sodium hydroxide* is required to change the colour of the indicator.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. Dissolve 0.5 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution. Dilute 0.1 ml of the test solution to 20 ml with *methanol R*.

Apply separately to the plate 2 µl of each solution. Develop over a path of 15 cm using a mixture of 40 volumes of *ethyl acetate R* and 60 volumes of *hexane R*. Allow the plate to dry in air for 15 min and expose it to iodine vapour. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Pyrocatechol. To 2 ml of solution S add 1 ml of *ammonium molybdate solution R2* and mix. Any yellow colour in the solution is not more intense than that in a standard prepared at the same time in the same manner using 2 ml of a 0.1 g/l solution of *pyrocatechol R*.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.00 g of powdered substance by drying in a desiccator for 4 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.500 g in *water R* and dilute to 250.0 ml with the same solvent. To 25.0 ml of the solution in a ground-glass-stoppered flask add 1.0 g of *potassium bromide R*, 50.0 ml of 0.0167 M *potassium bromate*, 15 ml of *chloroform R* and 15.0 ml of *hydrochloric acid R1*. Stopper the flask, shake and allow to stand in the dark for 15 min, shaking occasionally. Add 10 ml of a 100 g/l solution of *potassium iodide R*, shake thoroughly, allow to stand for 5 min and titrate with 0.1 M *sodium thiosulphate*, using 1 ml of *starch solution R* as indicator.

1 ml of 0.0167 M *potassium bromate* is equivalent to 1.835 mg of C₆H₆O₂.

STORAGE

Store protected from light.

RESTHARROW ROOT

Ononidis radix

DEFINITION

Whole or cut, dried root of *Ononis spinosa* L.

CHARACTERS

Macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

A. The root is more or less flattened, twisted and branched, deeply wrinkled, brown in colour and grooved longitudinally. The transversely cut surface shows a thin bark and a xylem cylinder with a conspicuously radiate structure. The fracture of the root is short and fibrous.

B. Reduce to a powder (355). The powder is light brown or brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows brown fragments of cork composed of thin-walled polygonal cells; groups of thick-walled narrow fibres, often accompanied by a parenchymatous crystal sheath containing prisms of calcium oxalate; fragments of vessels with numerous small bordered pits; parenchymatous cells with single prisms of calcium oxalate. Examine under a microscope using a mixture of equal volumes of *glycerol R* and *water R*. The powder shows numerous simple, round starch granules, 5 µm to 10 µm in diameter.

C. Thin-layer chromatography (2.2.27).

Test solution. To 1.0 g of the powdered drug (180) add 15.0 ml of *methanol R* and boil under a reflux condenser for 30 min. Cool and filter.

Reference solution. Dissolve 10 mg of *resorcinol R* and 50 mg of *vanillin R* in 10 ml of *methanol R*.

Plate: TLC silica gel F₂₅₄ plate R.

Mobile phase: *alcohol R*, *methylene chloride R*, *toluene R* (10:45:45 V/V/V).

Application: 20 µl, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection A: examine in ultraviolet light at 254 nm and 365 nm.

Results A: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fluorescent zones are present in the middle third of the chromatogram obtained with the test solution.

Top of the plate	
Vanillin: a zone visible at 254 nm	
Resorcinol: a zone visible at 254 nm	An intense blue fluorescent zone visible at 365 nm
Reference solution	Test solution

Detection B: spray with *anisaldehyde solution R*. Heat at 100-105 °C for 5-10 min. Examine in daylight.

Results B: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
Vanillin: a greyish-violet zone	A violet zone (onocol)
Resorcinol: a red zone	
Reference solution	Test solution

TESTS

Extractable matter: minimum 15.0 per cent.

To 2.00 g of the powdered drug (250) add a mixture of 8 g of *water R* and 12 g of *alcohol R* and allow to macerate for 2 h, shaking frequently. Filter, evaporate 5 g of the filtrate to dryness on a water-bath and dry at 100-105 °C for 2 h. The residue weighs a minimum of 75 mg.

Foreign matter (2.8.2). It complies with the test for foreign matter.

Loss on drying (2.2.32): maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100-105 °C for 2 h.

Total ash (2.4.16): maximum 8.0 per cent.

01/2005:0289

RHATANY ROOT

Ratanhiae radix

DEFINITION

Rhatany root, known as Peruvian rhatany, consists of the dried, usually fragmented, underground organs of *Krameria triandra* Ruiz and Pavon. It contains not less than 5.0 per cent of tannins, expressed as pyrogallol ($C_6H_6O_3$; M_r 126.1), calculated with reference to the dried drug.

CHARACTERS

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

A. The taproot is dark red-brown and has a thick, knotty crown. The secondary roots are the same colour and nearly straight or somewhat tortuous. The bark is rugged to scaly in the older pieces and smooth with sharp, transverse fissures in the younger pieces; it separates readily from the wood. The fracture is fibrous in the bark and splintery in the wood. The smooth, transversely cut surface shows a dark brown-red bark about one third of the radius in thickness; a dense, pale red-brown and finely porous wood is present with numerous fine medullary rays; the central heartwood is often darker.

B. Reduce to a powder (355). The powder is brown-red. Examine under a microscope using *chloral hydrate solution R*. The powder shows cork cells containing dark brown phlobaphenes; fragments of unlignified phloem fibres, usually 12 µm to 30 µm in diameter with moderately thick walls; phloem parenchyma cells in files containing prisms and microcrystals of calcium oxalate; fragments of vessels usually 20 µm to 60 µm in diameter with bordered pits; fragments of tracheids up to 20 µm wide with slit-shaped pits. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows rounded starch granules, simple or two-

four-compound, an individual granule measuring up to 30 µm in diameter and some granules being found in the cells of the medullary rays and in the parenchyma.

C. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution. To 1.0 g of the powdered drug (355) add 10 ml of a mixture of 3 volumes of *water R* and 7 volumes of *alcohol R*, shake for 10 min and filter. To the filtrate add 10 ml of *light petroleum R* and shake. Separate the light petroleum layer, add 2 g of *anhydrous sodium sulphate R*, shake and filter. Evaporate the filtrate to dryness. Dissolve the residue in 0.5 ml of *methanol R*.

Reference solution. Dissolve 5.0 mg of *Sudan red G R* in 10 ml of *methanol R*.

Apply to the plate as bands 10 µl of each solution. Develop over a path of 15 cm using a mixture of 2 volumes of *ethyl acetate R* and 98 volumes of *toluene R*. Allow the plate to dry in air and spray the plate with a 5 g/l solution of *fast blue B salt R*. Allow the plate to dry in air and spray the plate with 0.1 *M* *ethanolic sodium hydroxide*. Examine in daylight. The chromatogram obtained with the reference solution shows in the lower third a red zone due to Sudan red G. The chromatogram obtained with the test solution shows a violet zone due to rhatany phenol I similar in position to the zone of Sudan red G in the chromatogram obtained with the reference solution, below it the brownish zone due to rhatany phenol II and below it the bluish-grey zone due to rhatany phenol III. Further zones may be present.

TESTS

Foreign matter (2.8.2). Not more than 2 per cent of foreign matter and not more than 5 per cent of fragments of crown or root exceeding 25 mm in diameter. Root without bark may be present in very small quantities.

Loss on drying (2.2.32). Not more than 12.0 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100 °C to 105 °C.

Total ash (2.4.16). Not more than 5.5 per cent.

ASSAY

Carry out the determination of tannins in herbal drugs (2.8.14). Use 0.750 g of powdered drug (180).

STORAGE

Store protected from light.

01/2005:1888

RHATANY TINCTURE

Ratanhiae tinctura

DEFINITION

Tincture produced from *Rhatany root* (0289).

Content: minimum 1.0 per cent *m/m* of tannins, expressed as pyrogallol ($C_6H_6O_3$; M_r 126.1).

PRODUCTION

The tincture is produced from 1 part of the drug and 5 parts of ethanol (70 per cent *V/V*) by a suitable procedure.

CHARACTERS

Appearance: reddish-brown liquid.

IDENTIFICATION

Thin-layer chromatography (2.2.27).

Test solution. To 5 ml of the tincture to be examined, add 10 ml of *light petroleum R* and shake. Separate the light petroleum layer, add 2 g of *anhydrous sodium sulphate R*, shake and filter. Evaporate the filtrate to dryness. Dissolve the residue in 0.5 ml of *methylene chloride R*.

Reference solution. Dissolve 5 mg of *thymol R* and 10 mg of *dichlorophenolindophenol, sodium salt R* in 10 ml of *alcohol (60 per cent V/V) R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *methylene chloride R*.

Application: 10 µl, as bands.

Development: over a path of 10 cm.

Drying: in air.

Detection: spray with a 5 g/l solution of *fast blue B salt R*; allow the plate to dry in air and spray with 0.1 M *ethanolic sodium hydroxide*; examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Thymol: an orange brownish-yellow zone	A violet zone
	A greenish-grey zone
	A bluish-grey zone
	A yellowish-brown zone
Dichlorophenolindophenol: a greyish-blue zone	A violet zone
Reference solution	Test solution

TESTS

Ethanol (2.9.10): 63 per cent V/V to 67 per cent V/V.

Methanol and 2-propanol (2.9.11): maximum 0.05 per cent V/V of methanol and maximum 0.05 per cent V/V of 2-propanol.

ASSAY

Carry out the determination of tannins in herbal drugs (2.8.14) using 2.500 g of the tincture to be examined.

01/2005:0291

RHUBARB

Rhei radix

DEFINITION

Rhubarb consists of the whole or cut, dried underground parts of *Rheum palmatum* L. or of *Rheum officinale* Baillon or of hybrids of these two species or of a mixture. The underground parts are often divided; the stem and most of the bark with the rootlets are removed. It contains not less than 2.2 per cent of hydroxyanthracene derivatives, expressed as rhein (C₁₅H₈O₆, M_r 284.2), calculated with reference to the dried drug.

CHARACTERS

Rhubarb has a characteristic, aromatic odour.

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

A. The appearance is variable: disc-shaped pieces up to 10 cm in diameter and 1 cm to 5 cm in thickness; cylindrical pieces; oval or planoconvex pieces. The surface has a pinkish tinge and is usually covered with a layer of brownish-yellow powder. It shows, especially after moistening, a reticulum of darker lines. This structure causes the marbled appearance of the drug. The fracture is granular. The transverse section of the rhizome shows a narrow outer zone of radiating brownish-red lines. These medullary rays are crossed perpendicularly by a dark cambial ring. Inside this zone is a ring of small star-spot formations of anomalous vascular bundles. The root shows a more radiate structure.

B. Reduce to a powder (355). The powder is orange to brownish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: large calcium oxalate cluster crystals, which may measure more than 100 µm, and their fragments; reticulately thickened non-lignified vessels measuring up to 175 µm. Numerous groups of rounded or polygonal, thin-walled parenchyma cells. Sclereids and fibres are absent. Examine under a microscope using a 50 per cent V/V solution of *glycerol R*. The powder shows simple, rounded or compound (2 to 4) starch granules with a star-shaped hilum.

C. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution. Heat 50 mg of the powdered drug (180) in a water-bath for 15 min with a mixture of 1 ml of *hydrochloric acid R* and 30 ml of *water R*. Allow to cool and shake the liquid with 25 ml of *ether R*. Dry the ether layer over *anhydrous sodium sulphate R* and filter. Evaporate the ether layer to dryness and dissolve the residue in 0.5 ml of *ether R*.

Reference solution. Dissolve 5 mg of *emodin R* in 5 ml of *ether R*.

Apply separately to the plate as bands 20 µl of each solution. Develop over a path of 10 cm using a mixture of 1 volume of *anhydrous formic acid R*, 25 volumes of *ethyl acetate R* and 75 volumes of *light petroleum R*. Allow the plate to dry in air and examine in ultraviolet light at 365 nm. The chromatogram obtained with the reference solution shows in its central part a zone of orange fluorescence (emodin). The chromatogram obtained with the test solution shows: a zone due to emodin; above the emodin zone, two zones of similar fluorescence (physcione and chrysophanol, in order of increasing R_f value); below the emodin zone, also two zones of similar fluorescence (rhein and aloe-emodin, in order of decreasing R_f value). Spray with a 100 g/l solution of *potassium hydroxide R* in *methanol R*. All the zones become red to violet.

D. To about 50 mg of the powdered drug (180) add 25 ml of *dilute hydrochloric acid R* and heat the mixture on a water-bath for 15 min. Allow to cool, shake with 20 ml of *ether R* and discard the aqueous layer. Shake the ether layer with 10 ml of *dilute ammonia R1*. The aqueous layer becomes red to violet.

TESTS

Rheum rhaponticum. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. To 0.2 g of the powdered drug (180) add 2 ml of *methanol R* and boil for 5 min under a reflux condenser. Allow to cool and filter. Use the filtrate as the test solution.

Reference solution. Dissolve 10 mg of *rhaponticin R* in 10 ml of *methanol R*.

01/2005:2109

Apply separately to the plate, as bands not more than 20 mm by 3 mm, 20 µl of each solution. Develop over a path of 12 cm using a mixture of 20 volumes of *methanol R* and 80 volumes of *methylene chloride R*. Allow the plate to dry in air and spray with *phosphomolybdic acid solution R*. The chromatogram obtained with the test solution does not show a blue zone near the starting-line (rhaponticin) corresponding to the zone in the chromatogram obtained with the reference solution.

Foreign matter (2.8.2). It complies with the test for foreign matter.

Loss on drying (2.2.32). Not more than 12.0 per cent, determined on 1.000 g of the powdered drug (180) by drying in an oven at 100 °C to 105 °C.

Total ash (2.4.16). Not more than 12.0 per cent.

Ash insoluble in hydrochloric acid (2.8.1). Not more than 2.0 per cent.

ASSAY

Carry out the assay protected from bright light.

Introduce 0.100 g of the powdered drug (180) into a 100 ml flask. Add 30.0 ml of *water R*, mix and weigh. Heat in a water-bath under a reflux condenser for 15 min. Allow to cool, add 50 mg of *sodium hydrogen carbonate R*, weigh and adjust to the original mass with *water R*. Centrifuge and transfer 10.0 ml of the liquid to a 100 ml round-bottomed flask with a ground-glass neck. Add 20 ml of *ferric chloride solution RI* and mix. Heat under a reflux condenser on a water-bath for 20 min, add 1 ml of *hydrochloric acid R* and heat for a further 20 min, shaking frequently. Cool, transfer to a separating funnel and shake with three quantities, each of 25 ml, of *ether R* previously used to rinse the flask. Combine the ether extracts and wash with two quantities, each of 15 ml, of *water R*. Filter the ether extracts through a plug of absorbent cotton into a volumetric flask and dilute to 100.0 ml with *ether R*. Evaporate 10.0 ml carefully to dryness on a water-bath and dissolve the residue in 10.0 ml of a 5 g/l solution of *magnesium acetate R* in *methanol R*. Measure the absorbance (2.2.25) at 515 nm, using *methanol R* as the compensation liquid.

Calculate the percentage content of rhein from the expression:

$$\frac{A \times 0.64}{m}$$

i.e. taking the specific absorbance of rhein to be 468, calculated on the basis of the specific absorbance of barbaloin.

A = absorbance at 515 nm,

m = mass of the drug used, in grams.

STORAGE

Store protected from light.

RIBAVIRIN

Ribavirinum

 $C_8H_{12}N_4O_5$
 M_r 244.2

DEFINITION

1-β-D-Ribofuranosyl-1H-1,2,4-triazole-3-carboxamide.

Content: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water, slightly soluble in ethanol (96 per cent), slightly soluble or very slightly soluble in methylene chloride.

It shows polymorphism.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: *ribavirin CRS*.

If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *methylene chloride R*, evaporate to dryness and record new spectra using the residues.

TESTS

pH (2.2.3): 4.0 to 6.5.

Dissolve 0.200 g in *carbon dioxide-free water R* and dilute to 10.0 ml with the same solvent.

Specific optical rotation (2.2.7): –33 to –37 (dried substance).

Dissolve 0.250 g in *water R* and dilute to 25.0 ml with the same solvent. Determine the specific optical rotation within 10 min of preparing the solution.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve the contents of a vial of *ribavirin for system suitability CRS* in 2.0 ml of the mobile phase.

Reference solution (c). Dissolve 25.0 mg of *ribavirin CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 10.0 ml of the solution to 100.0 ml with the mobile phase.

Column:

- **size:** $l = 0.10$ m, $\varnothing = 7.8$ mm,
- **stationary phase:** *strong cation-exchange resin R* (9 µm),
- **temperature:** 40 °C.

Mobile phase: water R adjusted to pH 2.5 with sulphuric acid R.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 207 nm.

Injection: 10 µl of the test solution and reference solutions (a) and (b).

Run time: 11 times the retention time of ribavirin.

Relative retention with reference to ribavirin (retention time = about 4 min): impurity F = about 1.2.

System suitability: reference solution (b):

- **peak-to-valley ratio:** minimum 1.2, where H_p = height above the baseline of the peak due to impurity F and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to ribavirin.

Limits:

- **impurity F:** not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- **any other impurity:** for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- **total:** not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),
- **disregard limit:** 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.4.8): maximum 10 ppm.

Dissolve 4.0 g in 20 ml of water R. 12 ml of the solution complies with limit test A. Prepare the reference solution using 10 ml of lead standard solution (2 ppm Pb) R.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C for 5 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modification.

Injection: test solution and reference solution (c).

Calculate the percentage content of $C_8H_{12}N_4O_5$ using the declared content of $C_8H_{12}N_4O_5$ in ribavirin CRS.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: F.

Other detectable impurities: A, B, C, D, E, G.

- A. R1 = H, R2 = OH: 1-β-D-ribofuranosyl-1H-1,2,4-triazole-3-carboxylic acid,
- E. R1 = CO-C₆H₅, R2 = NH₂: 1-(5-O-benzoyl-β-D-ribofuranosyl)-1H-1,2,4-triazole-3-carboxamide (5'-O-benzoylribavirin),

- F. R1 = CO-CH₃, R2 = NH₂: 1-(5-O-acetyl-β-D-ribofuranosyl)-1H-1,2,4-triazole-3-carboxamide (5'-O-acetylribavirin),

- B. 1-α-D-ribofuranosyl-1H-1,2,4-triazole-3-carboxamide (anomer),

- C. R = OH: 1H-1,2,4-triazole-3-carboxylic acid,

- D. R = NH₂: 1H-1,2,4-triazole-3-carboxamide,

- G. 1-β-D-ribofuranosyl-1H-1,2,4-triazole-5-carboxamide (N-isomer).

01/2005:0292

RIBOFLAVIN

Riboflavinum

$C_{17}H_{20}N_4O_6$

M_r 376.4

DEFINITION

7,8-Dimethyl-10-[(2S,3S,4R)-2,3,4,5-tetrahydroxypentyl]benzo[g]pteridine-2,4(3H,10H)-dione.

Contents: 97.0 per cent to 103.0 per cent (dried substance).

CHARACTERS

Appearance: yellow or orange-yellow, crystalline powder.

Solubility: very slightly soluble in water, practically insoluble in alcohol.

Solutions deteriorate on exposure to light, especially in the presence of alkali.

It shows polymorphism.

IDENTIFICATION

- A. It complies with the test for specific optical rotation (see Tests).

- B. Examine the chromatogram obtained in the test for lumiflavin.

Results: the principal spot in the chromatogram obtained with test solution (a) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

- C. Dissolve about 1 mg in 100 ml of *water R*. The solution has, by transmitted light, a pale greenish-yellow colour, and, by reflected light, an intense yellowish-green fluorescence which disappears on the addition of mineral acids or alkalis.

TESTS

Specific optical rotation (2.2.7): –115 to –135 (dried substance).

Dissolve 50.0 mg in 0.05 M *sodium hydroxide* free from carbonate and dilute to 10.0 ml with the same alkaline solution. Measure the optical rotation within 30 min of dissolution.

Absorbance (2.2.25). Dilute the final solution prepared for the assay with an equal volume of *water R*. The solution shows 4 maxima, at 223 nm, 267 nm, 373 nm and 444 nm. The ratio of the absorbance at the maximum at 373 nm to that at the maximum at 267 nm is 0.31 to 0.33, and the ratio of the absorbance at the maximum at 444 nm to that at the maximum at 267 nm is 0.36 to 0.39.

Lumiflavin. Thin-layer chromatography (2.2.27).

Test solution (a). Suspend 25 mg in 10 ml of *water R*; shake for 5 min and filter the suspension to remove the undissolved material.

Test solution (b). Shake 25 mg of the substance to be examined with 10.0 ml of *methylene chloride R* and filter the suspension to remove the undissolved material.

Reference solution (a). Suspend 25 mg of *riboflavin CRS* in 10 ml of *water R*; shake for 5 min and filter the suspension to remove the undissolved material.

Reference solution (b). Dissolve 25 mg of *lumiflavin R* in *methylene chloride R* and dilute to 50.0 ml with the same solvent. Dilute 1.0 ml of the solution to 20.0 ml with *methylene chloride R*.

Reference solution (c). Dilute 2.5 ml of reference solution (b) to 100.0 ml with *methylene chloride R*.

Plate: *TLC silica gel plate R* (2–10 µm).

Mobile phase: *water R*.

Application: as follows, dry in a current of cold air after each individual application:

- 1st application: 2 µl of *methylene chloride R* followed by 2 µl of test solution (a),
- 2nd application: 2 µl of *methylene chloride R* followed by 2 µl of reference solution (a),
- 3rd application: 2 µl of reference solution (b) followed by 2 µl of reference solution (a),
- 4th application: 10 µl of test solution (b),
- 5th application: 10 µl of reference solution (c).

Development: over a path of 6 cm.

Drying: in a current of cold air.

Detection: examine in ultraviolet light at 365 nm.

System suitability: the chromatogram obtained with the 3rd application shows 2 clearly separated spots.

Limit: in the chromatogram obtained with test solution (b):

- *lumiflavin*: any spot corresponding to lumiflavin is not more intense than the principal spot in the chromatogram obtained with reference solution (c) (0.025 per cent).

Loss on drying (2.2.32): maximum 1.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on the residue obtained in the test for loss on drying.

ASSAY

Carry out the assay protected from light.

In a brown-glass 500 ml volumetric flask, suspend 65.0 mg in 5 ml of *water R* ensuring that it is completely wetted and dissolve in 5 ml of *dilute sodium hydroxide solution R*. As soon as dissolution is complete, add 100 ml of *water R* and 2.5 ml of *glacial acetic acid R* and dilute to 500.0 ml with *water R*. Place 20.0 ml of this solution in a 200 ml brown-glass volumetric flask, add 3.5 ml of a 14 g/l solution of *sodium acetate R* and dilute to 200.0 ml with *water R*. Measure the absorbance (2.2.25) at the maximum at 444 nm. Calculate the content of C₁₇H₂₀N₄O₆ taking the specific absorbance to be 328.

STORAGE

In an airtight container, protected from light.

IMPURITIES

- A. 7,8,10-trimethylbenzo[*g*]pteridine-2,4(3*H*,10*H*)-dione (lumiflavin).

01/2005:0786

RIBOFLAVIN SODIUM PHOSPHATE

Riboflavini natrii phosphas

C₁₇H₂₀N₄NaO₉P

*M*_r 478.3

DEFINITION

Riboflavin sodium phosphate is a mixture containing riboflavin 5'-(sodium hydrogen phosphate) as the main component and other riboflavin sodium monophosphates. It contains not less than 73.0 per cent and not more than 79.0 per cent of riboflavin (C₁₇H₂₀N₄O₆; *M*_r 376.4), calculated with reference to the dried substance. It contains a variable amount of water.

CHARACTERS

A yellow or orange-yellow, crystalline powder, hygroscopic, soluble in water, very slightly soluble in alcohol.

IDENTIFICATION

- A. Dissolve 50.0 mg in *phosphate buffer solution pH 7.0 R* and dilute to 100.0 ml with the same buffer solution. Dilute 2.0 ml of the solution to 100.0 ml with *phosphate*

buffer solution pH 7.0 R. Examined between 230 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 266 nm. The specific absorbance at the maximum is 580 to 640.

- B. Examine the chromatograms obtained in the test for related substances. The principal peak in the chromatogram obtained with the test solution is similar in position and approximate size to the principal peak in the chromatogram obtained with reference solution (b).
- C. Dissolve about 10 mg in *dilute sodium hydroxide solution R* and dilute to 100 ml with the same solution. Expose 1 ml to ultraviolet light at 254 nm for 5 min, add sufficient *acetic acid R* to make the solution acidic to *blue litmus paper R* and shake with 2 ml of *methylene chloride R*. The lower layer shows yellow fluorescence.
- D. To 0.5 g add 10 ml of *nitric acid R*, evaporate the mixture to dryness on a water-bath. Ignite the residue until it becomes white, dissolve the residue in 5 ml of *water R* and filter. The filtrate gives reaction (a) of sodium and reaction (b) of phosphates (2.3.1).

TESTS

pH (2.2.3). Dissolve 0.5 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent. The pH of the solution is 5.0 to 6.5.

Specific optical rotation (2.2.7). Dissolve 0.300 g in 18.2 ml of *hydrochloric acid R1* and dilute to 25.0 ml with *water R*. The specific optical rotation is + 38.0 to + 43.0, calculated with reference to the dried substance.

Lumiflavin. To about 35 mg add 10 ml of *methylene chloride R*, shake for 5 min and filter. The filtrate is not more intensely coloured than reference solution BY₆ (2.2.2, Method II).

Related substances. Examine by liquid chromatography (2.2.29). Carry out the test protected from actinic light.

Test solution. Dissolve 0.100 g of the substance to be examined in 50 ml of *water R* and dilute to 100.0 ml with the mobile phase. Dilute 8.0 ml of this solution to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 60 mg of *riboflavin CRS* in 1 ml of *hydrochloric acid R* and dilute to 250.0 ml with *water R*. Dilute 4.0 ml to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 0.100 g of *riboflavin sodium phosphate CRS* in 50 ml of *water R* and dilute to 100.0 ml with the mobile phase. Dilute 8.0 ml of this solution to 50.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 2 ml/min a mixture of 150 volumes of *methanol R* and 850 volumes of a 7.35 g/l solution of *potassium dihydrogen phosphate R*,
- as detector a spectrophotometer set at 266 nm.

When the chromatograms are recorded in the prescribed conditions, the retention time of riboflavin 5'-monophosphate is about 20 min and the relative retention times are: riboflavin 3',4'-diphosphate about 0.2, riboflavin 3',5'-diphosphate about 0.3, riboflavin 4',5'-diphosphate about 0.5, riboflavin 3'-monophosphate about 0.7, riboflavin 4'-mono-phosphate about 0.9, riboflavin 5'-monophosphate 1, riboflavin about 2.

Inject 100 µl of reference solution (a). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained is at least 50 per cent of the full scale of the recorder. Inject 100 µl of reference solution (b). Continue the chromatography until the peak corresponding to riboflavin can be clearly evaluated. The test is not valid unless in the chromatogram obtained with reference solution (b), the resolution between the peaks corresponding to riboflavin 4'-monophosphate and riboflavin 5'-monophosphate is at least 1.5.

Inject 100 µl of the test solution, 100 µl of reference solution (a) and 100 µl of reference solution (b). Calculate the percentage content of free riboflavin and of riboflavin in the form of the diphosphates of riboflavin from the areas of the peaks in the chromatogram obtained with the test solution and the amount of free riboflavin in reference solution (a). The content of free riboflavin is not greater than 6.0 per cent and the content of riboflavin in the form of the diphosphates of riboflavin is not greater than 6.0 per cent, both calculated with reference to dried material.

Inorganic phosphate. Dissolve 0.10 g in *water R* and dilute to 100 ml with the same solvent. To 5 ml of the solution, add 10 ml of *water R*, 5 ml of *buffered copper sulphate solution pH 4.0 R*, 2 ml of a 30 g/l solution of *ammonium molybdate R*, 1 ml of a freshly prepared solution containing 20 g/l of *4-methylaminophenol sulphate R* and 50 g/l of *sodium metabisulphite R* and 1 ml of a 3 per cent V/V solution of *perchloric acid R*. Dilute to 25.0 ml with *water R* and measure, within 15 min of its preparation, the absorbance of the solution at 800 nm (2.2.25) using as the compensation liquid a solution prepared in the same manner but without the substance to be examined. The absorbance is not greater than that of a solution prepared as follows: to 15 ml of *phosphate standard solution (5 ppm PO₄) R*, add 5 ml of *buffered copper sulphate solution pH 4.0 R*, 2 ml of a 30 g/l solution of *ammonium molybdate R*, 1 ml of a freshly prepared solution containing 20 g/l of *4-methylaminophenol sulphate R* and 50 g/l of *sodium metabisulphite R* and 1 ml of a 3 per cent V/V solution of *perchloric acid R*; dilute to 25.0 ml with *water R* (1.5 per cent).

Heavy metals (2.4.8). To 2.0 g in a silica crucible add 2 ml of *nitric acid R*, dropwise, followed by 0.25 ml of *sulphuric acid R*. Heat cautiously until white fumes are evolved and ignite. Extract the cooled residue with two quantities, each of 2 ml, of *hydrochloric acid R* and evaporate the extracts to dryness. Dissolve the residue in 2 ml of *dilute acetic acid R* and dilute to 20 ml with *water R*. 12 ml of the solution complies with limit test A for heavy metals (10 ppm). Prepare the standard using 10 ml of *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 8.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C at a pressure not exceeding 0.7 kPa for 5 h.

ASSAY

Carry out the assay protected from light.

Dissolve 0.100 g in 150 ml of *water R*, add 2 ml of *glacial acetic acid R* and dilute to 1000.0 ml with *water R*. To 10.0 ml add 3.5 ml of a 14 g/l solution of *sodium acetate R* and dilute to 50.0 ml with *water R*. Measure the absorbance (2.2.25) at the maximum at 444 nm.

Calculate the content of C₁₇H₂₀N₄O₆ taking the specific absorbance to be 328.

STORAGE

Store in an airtight container, protected from light.

IMPURITIES

- A. R3 = R4 = PO₃H₂, R5 = H: riboflavin 3',4'-diphosphate,
 B. R3 = R5 = PO₃H₂, R4 = H: riboflavin 3',5'-diphosphate,
 C. R3 = H, R4 = R5 = PO₃H₂: riboflavin 4',5'-diphosphate,
 D. R3 = R4 = R5 = H: riboflavin,

- E. 7,8,10-trimethylbenzo[*g*]pteridine-2,4(3*H*,10*H*)-dione (lumiflavin).

01/2005:1884

RIBWORT PLANTAIN

Plantaginis lanceolatae folium

DEFINITION

Whole or fragmented, dried leaf and scape of *Plantago lanceolata* L. s. l.

Content: minimum 1.5 per cent of total *ortho*-dihydroxycinnamic acid derivatives expressed as acteoside (C₂₉H₃₆O₁₅; *M_r* 624.6) (dried drug).

CHARACTERS

Macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The leaf is up to 30 cm long and 4 cm wide, yellowish-green to brownish-green, with a prominent, whitish-green, almost parallel venation on the abaxial surface. It consists of a lanceolate lamina narrowing at the base into a channelled petiole. The margin is indistinctly dentate and often undulate. It has 3, 5 or 7 primary veins, nearly equal in length and running almost parallel. Hairs may be almost absent, sparsely scattered or sometimes abundant, especially on the lower surface and over the veins. The scape is brownish-green, longer than the leaves, 3 mm to 4 mm in diameter and is deeply grooved longitudinally, with 5 to 7 conspicuous ribs. The surface is usually covered with fine hairs.
- B. Reduce to a powder (355). The powder is yellowish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of epidermis, composed of cells with irregularly sinuous anticlinal walls, the fragments from the scape with thickened outer walls and a coarsely

ridged cuticle; stomata mostly of the diacytic type (2.8.3) and sometimes anomocytic; the multicellular, uniseriate, conical covering trichomes are highly characteristic, with a basal cell larger than the other epidermal cells followed by a short cell supporting 2 or more elongated cells with the lumen narrow and variable, occluded at intervals corresponding to slight swellings in the trichome and giving a jointed appearance; the terminal cell has an acute apex and a filiform lumen; the glandular trichomes have a unicellular cylindrical stalk and a multicellular, elongated, conical head consisting of several rows of small cells and a single terminal cell; dense groups of lignified fibro-vascular tissue with narrow, spirally and annularly thickened vessels and slender, moderately thickened fibres.

- C. Examine the chromatograms obtained for *Digitalis lanata* leaves.

Results A: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatograms obtained with the test solution.

Top of the plate	
Acteoside: a yellow zone	A yellow zone (acteoside)
Aucubin: a blue zone	A blue zone (aucubin)
Reference solution	Test solution

TESTS

***Digitalis lanata* leaves.** Thin layer chromatography (2.2.27).

Test solution. Use a freshly prepared solution. To 1 g of the powdered drug (355) in a 25 ml flask, add 10 ml of a mixture of 30 volumes of *water R* and 70 volumes of *methanol R* and shake for 30 min. Filter, rinse the flask and filter with 2 quantities, each of 5 ml, with the mixture of 30 volumes of *water R* and 70 volumes of *methanol R*. Dilute to 25 ml with a mixture of 30 volumes of *water R* and 70 volumes of *methanol R*.

Reference solution. Dissolve 1 mg of *acteoside R* and 1 mg of *aucubin R* in 1 ml of a mixture of 30 volumes of *water R* and 70 volumes of *methanol R*.

Plate: TLC silica gel *F₂₅₄* plate *R*.

Mobile phase: *acetic acid R*, *anhydrous formic acid R*, *water R*, *ethyl acetate R* (11:11:27:100 V/V/V/V).

Application: 10 µl as bands.

Development: over a path of 8 cm; heat immediately after development at about 120 °C for 5-10 min.

Detection A: examine in daylight.

Detection B: examine in ultraviolet light at 365 nm.

Results B: the chromatogram obtained with the test solution shows no bright blue fluorescent zone just below the reddish-brown fluorescent zone corresponding to aucubin in the chromatogram obtained with the reference solution.

Foreign matter (2.8.2): maximum 5 per cent of leaves of different colour and maximum 2 per cent of other foreign matter.

Loss on drying (2.2.32): maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100-105 °C for 2 h.

Total ash (2.4.16): maximum 14.0 per cent.

ASSAY

Stock solution. In a flask, place 1.000 g of the powdered drug (355) and add 90 ml of *alcohol* (50 per cent V/V) *R*. Boil in a water-bath under a reflux condenser for 30 min. Allow to cool and filter into a 100 ml volumetric flask. Rinse the flask and the filter with 10 ml of *alcohol* (50 per cent V/V) *R*. Combine the filtrate and the rinsings and dilute to 100.0 ml with *alcohol* (50 per cent V/V) *R*.

Test solution. To a 10 ml volumetric flask add, mixing after each addition, 1.0 ml of stock solution, 2 ml of 0.5 *M* hydrochloric acid, 2 ml of a solution prepared by dissolving 10 g of sodium nitrite *R* and 10 g of sodium molybdate *R* in 100 ml of water *R* and then add 2 ml of dilute sodium hydroxide solution *R*. Dilute to 10.0 ml with water *R*.

Immediately measure the absorbance (2.2.25) of the test solution at 525 nm using as compensation liquid a solution prepared as follows: to a 10 ml volumetric flask, add 1.0 ml of stock solution, 2 ml of 0.5 *M* hydrochloric acid, 2 ml of dilute sodium hydroxide solution *R* and dilute to 10.0 ml with water *R*.

Calculate the percentage content of total *ortho*-dihydroxycinnamic acid derivatives, expressed as acteoside, from the expression:

$$\frac{A \times 1000}{185 \times m}$$

i.e. taking the specific absorbance to be 185 for acteoside at 525 nm.

A = absorbance of the test solution at 525 nm,

m = mass of the substance to be examined, in grams.

01/2005:0349

RICE STARCH

Oryzae amyllum

DEFINITION

Rice starch is obtained from the caryopsis of *Oryza sativa* L.

CHARACTERS

A very fine, white powder which creaks when pressed between the fingers, tasteless, practically insoluble in cold water and in alcohol. The presence of granules with cracks or irregularities on the edge is exceptional.

DESCRIPTION

Examined under a microscope it presents polyhedral granules 2 µm to 5 µm in size, either isolated or aggregated in ovoid masses of 10 µm to 20 µm in size. The granules have a poorly visible central hilum and there are no concentric striations. Between crossed nicol prisms, the starch granules show a distinct black cross intersecting at the hilum.

IDENTIFICATION

- Suspend 1 g in 50 ml of water *R*, boil for 1 min and cool. A thin, cloudy mucilage is formed.
- To 1 ml of the mucilage obtained in identification test A add 0.05 ml of iodine solution *R1*. A dark-blue colour is produced which disappears on heating.

TESTS

Acidity. Add 10 g to 100 ml of *alcohol* (70 per cent V/V) *R* previously neutralised to 0.5 ml of phenolphthalein solution *R* and shake for 1 h. Filter and take 50 ml of the filtrate. Not more than 2.0 ml of 0.1 *M* sodium hydroxide is required to change the colour of the indicator.

Foreign matter. Not more than traces of cell membranes and protoplasm are present.

Loss on drying (2.2.32). Not more than 15.0 per cent, determined on 1.00 g by drying in an oven at 100-105 °C.

Sulphated ash (2.4.14). Not more than 1.0 per cent, determined on 1.0 g.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10³ bacteria and 10² fungi per gram, determined by plate count. It complies with the test for *Escherichia coli* (2.6.13).

STORAGE

In an airtight container.

corrected

RIFABUTIN

Rifabutinum

C₄₆H₆₂N₄O₁₁*M*_r 847

DEFINITION

(9*S*,12*E*,14*S*,15*R*,16*S*,17*R*,18*R*,19*R*,20*S*,21*S*,22*E*,24*Z*)-6,18,20-trihydroxy-14-methoxy-7,9,15,17,19,21,25-heptamethyl-1'-(2-methylpropyl)-5,10,26-trioxo-3,5,9,10-tetrahydrospiro[9,4-(epoxypentadeca[1,11,13]trienimino)-2*H*-furo[2',3':7,8]naphtho[1,2-*d*]imidazole-2,4'-piperidine]-16-yl acetate.

Content: 96.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: reddish-violet amorphous powder.

Solubility: slightly soluble in water, soluble in methanol, slightly soluble in alcohol.

IDENTIFICATION

- Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: rifabutin CRS.

- Examine the chromatograms obtained in the test for related substances.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (a).

TESTS

Impurity A. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 0.100 g of the substance to be examined in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution. Dissolve 10 mg of *rifabutin impurity A CRS* in a mixture of equal volumes of *methanol R* and *methylene chloride R* and dilute to 10 ml with the same mixture of solvents. Dilute 3 ml of the solution to 100 ml with a mixture of equal volumes of *methanol R* and *methylene chloride R*.

Plate: TLC silica gel F_{254} plate *R*.

Mobile phase: *acetone R*, *light petroleum R* (23:77 V/V).

Application: 10 µl.

Development: over 2/3 of the plate.

Drying: in air.

Detection: expose the plate to iodine vapour for about 5 min, then spray with *potassium iodide and starch solution R* and allow to stand for 5 min.

Limit:

- **impurity A:** any spot corresponding to impurity A is not more intense than the spot in the chromatogram obtained with the reference solution (0.3 per cent).

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 50.0 mg of *rifabutin CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Reference solution (c). Dissolve about 10 mg of *rifabutin CRS* in 2 ml of *methanol R*, add 1 ml of *dilute sodium hydroxide solution R* and allow to stand for about 4 min. Add 1 ml of *dilute hydrochloric acid R* and dilute to 50 ml with the mobile phase.

Column:

- **size:** $l = 0.110$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** *octylsilyl silica gel for chromatography R* (5 µm).

Mobile phase: mix equal volumes of *acetonitrile R* and a 13.6 g/l solution of *potassium dihydrogen phosphate R* adjusted to pH 6.5 with *dilute sodium hydroxide solution R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 µl.

Run time: 2.5 times the retention time of rifabutin.

Relative retention with reference to rifabutin (retention time = about 9 min): impurity E = about 0.5; impurity B = about 0.6; impurity D = about 0.9; impurity C = about 1.3.

System suitability: reference solution (c):

- **resolution:** minimum 2.0 between the second peak of the 3 peaks due to degradation products and the peak due to rifabutin.

Limits:

- **any impurity:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent); not more than 1 such peak has an area greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
- **total:** not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent),
- **disregard limit:** 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Water (2.5.12): maximum 2.5 per cent, determined on 0.200 g.

Sulphated ash (2.4.14): maximum 0.3 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modification.

Injection: test solution and reference solution (a).

Calculate the percentage content of rifabutin.

IMPURITIES

A. 1-(2-methylpropyl)piperidin-4-one,

B. X = O: 3-aminorifamycin S,

D. X = NH: 3-amino-4-imidorifamycin S,

- C. R1 = CO-CH₃, R2 + R3 = CH₂: 21,31-didehydrorifabutin,
 E. R1 = R3 = H, R2 = CH₃: 16-deacetyl rifabutin.

01/2005:0052

RIFAMPICIN

Rifampicinum

C₄₃H₅₈N₄O₁₂M_r 823

DEFINITION

Rifampicin is (2*S*,12*Z*,14*E*,16*S*,17*S*,18*R*,19*R*,20*R*,21*S*,22*R*,23*S*,24*E*)-5,6,9,17,19-pentahydroxy-23-methoxy-2,4,12,16,18,20,22-heptamethyl-8-[[[4-methylpiperazin-1-yl]imino]methyl]-1,11-dioxo-1,2-dihydro-2,7-(epoxypentadeca[1,11,13]trienimino)naphto[2,1-*b*]furan-21-yl acetate, a semisynthetic antibiotic obtained from rifamycin SV. It contains not less than 97.0 per cent and not more than the equivalent of 102.0 per cent of C₄₃H₅₈N₄O₁₂, calculated with reference to the dried substance.

CHARACTERS

A reddish-brown or brownish-red, crystalline powder, slightly soluble in water, soluble in methanol, slightly soluble in acetone and in alcohol.

IDENTIFICATION

- A. Dissolve 50 mg in 50 ml of *methanol R*. Dilute 1 ml of the solution to 50 ml with *phosphate buffer solution pH 7.4 R*. Examined between 220 nm and 500 nm, the solution shows 4 absorption maxima (2.2.25), at 237 nm, 254 nm, 334 nm and 475 nm. The ratio of the absorbance at the maximum at 334 nm to that at 475 nm is about 1.75.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *rifampicin CRS*. Examine the substances prepared as mulls in *liquid paraffin R*.

- C. Suspend about 25 mg in 25 ml of *water R*, shake for 5 min and filter. To 5 ml of the filtrate add 1 ml of a 100 g/l solution of *ammonium persulphate R* in *phosphate buffer solution pH 7.4 R* and shake for a few minutes. The colour changes from orange-yellow to violet-red and no precipitate is formed.

TESTS

pH (2.2.3). The pH of a 10 g/l suspension in *carbon dioxide-free water R* is 4.5 to 6.5.

Related substances. Examine by liquid chromatography (2.2.29). Prepare the test solution and the reference solution immediately before use.

Solvent mixture. To 10 volumes of a 210.1 g/l solution of *citric acid R* add 23 volumes of a 136.1 g/l solution of *potassium dihydrogen phosphate R*, 77 volumes of a 174.2 g/l solution of *dipotassium hydrogen phosphate R*, 250 volumes of *acetonitrile R* and 640 volumes of *water R*.

Test solution. Dissolve 20.0 mg of the substance to be examined in *acetonitrile R* and dilute to 10.0 ml with the same solvent. Dilute 5.0 ml to 50.0 ml with the solvent mixture.

Reference solution. Dissolve 20.0 mg of *rifampicin quinone CRS* in *acetonitrile R* and dilute to 100.0 ml with the same solvent. To 1.0 ml of the solution add 1.0 ml of the test solution and dilute to 100.0 ml with the solvent mixture.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.12 m long and 4.6 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.5 ml/min a mixture of 35 volumes of *acetonitrile R* and 65 volumes of a solution containing 0.1 per cent V/V of *phosphoric acid R*, 1.9 g/l of *sodium perchlorate R*, 5.9 g/l of *citric acid R* and 20.9 g/l of *potassium dihydrogen phosphate R*,
- as detector a spectrophotometer set at 254 nm,
- a 20 µl loop injector.

Inject the reference solution. Adjust the sensitivity of the detector so that the height of the 2 principal peaks is not less than half the full scale of the recorder. The test is not valid unless the resolution between the 2 principal peaks is at least 4.0. Adjust the concentration of acetonitrile in the mobile phase, if necessary. Inject the test solution and continue the chromatography for at least twice the retention time of rifampicin: the area of any peak corresponding to rifampicin quinone is not greater than 1.5 times the area of the corresponding peak in the chromatogram obtained with the reference solution (1.5 per cent); the area of any peak, apart from the principal peak and the peak corresponding to rifampicin quinone, is not greater than the area of the rifampicin peak in the chromatogram obtained with the reference solution (1.0 per cent) and the sum of the areas of any such peaks is not greater than 3.5 times the area of the rifampicin peak in the chromatogram obtained with the reference solution (3.5 per cent). Disregard any peak due to the solvent and any peak with an area less than 0.05 times that of the peak corresponding to rifampicin in the chromatogram obtained with the reference solution.

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying at 80 °C at a pressure not exceeding 670 Pa for 4 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 2.0 g.

ASSAY

Dissolve 0.100 g in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml of the solution to 100.0 ml with *phosphate buffer solution pH 7.4 R*. Measure the absorbance (2.2.25) at the maximum at 475 nm, using *phosphate buffer solution pH 7.4 R* as the compensation liquid.

Calculate the content of $C_{43}H_{58}N_4O_{12}$, taking the specific absorbance to be 187.

STORAGE

Store under nitrogen in an airtight container, protected from light at a temperature not exceeding 25 °C.

IMPURITIES

A. rifampicin quinone,

B. rifampicin N-oxide.

01/2005:0432

RIFAMYCIN SODIUM

Rifamycinum natricum

 $C_{37}H_{46}NNaO_{12}$ M_r 720

DEFINITION

Rifamycin sodium is sodium (2*S*,12*Z*,14*E*,16*S*,17*S*,18*R*,19*R*,20*R*,21*S*,22*R*,23*S*,24*E*)-21-(acetyloxy)-6,9,17,19-tetrahydroxy-23-methoxy-2,4,12,16,18,20,22-heptamethyl-1,11-dioxo-1,2-dihydro-2,7-(epoxypentadeca[1,11,13]trienimino)naphtho[2,1-*b*]furan-5-olate, the monosodium salt of rifamycin SV, a substance obtained by chemical transformation of rifamycin B, which is produced during the growth of certain strains of *Amycolatopsis mediterranei*. Rifamycin SV may also be obtained directly from certain *A. mediterranei* mutants. The potency is not less than 900 IU/mg, calculated with reference to the anhydrous substance.

PRODUCTION

It is produced by methods of manufacture designed to minimise or eliminate substances lowering blood pressure. The method of manufacture is validated to demonstrate that the product if tested would comply with the following test.

Abnormal toxicity (2.6.9). Inject into each mouse 4 mg dissolved in 0.5 ml of *water for injections R*.

CHARACTERS

A fine or slightly granular, red powder, soluble in water, freely soluble in ethanol.

IDENTIFICATION

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *rifamycin sodium CRS*. Examine the substances as discs prepared using *potassium bromide R*.
- It gives reaction (a) of sodium (2.3.1).

TESTS

pH (2.2.3). Dissolve 0.5 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent. The pH is 6.5 to 8.0.

Absorbance (2.2.25). Dissolve 20.0 mg in 5 ml of *methanol R* and dilute to 100.0 ml with freshly prepared *phosphate buffer solution pH 7.0 R1* to which 1 g/l of *ascorbic acid R* has been added immediately before use. Dilute 5.0 ml of the solution to 50.0 ml with the same phosphate buffer solution containing ascorbic acid. Allow to stand for 30 min. The solution shows an absorption maximum at 445 nm. The specific absorbance at the maximum is 190 to 210, calculated with reference to the anhydrous substance.

Rifamycin B, rifamycin S and other related substances.

Examine by liquid chromatography (2.2.29). *Prepare the solutions immediately before use.*

Test solution. Dissolve 50.0 mg of the substance to be examined in a mixture of equal volumes of a 3.9 g/l solution of *sodium dihydrogen phosphate R*, adjusted to pH 3.0 with *phosphoric acid R*, and *acetonitrile R* and dilute to 50.0 ml with the same mixture of solvents.

Reference solution (a). Dissolve 10.0 mg of *rifamycin B CRS* and 40.0 mg of *rifamycin S CRS* in a mixture of equal volumes of a 3.9 g/l solution of *sodium dihydrogen phosphate R*, adjusted to pH 3.0 with *phosphoric acid R*, and *acetonitrile R* and dilute to 200.0 ml with the same mixture of solvents. Dilute 5.0 ml of the solution to 50.0 ml with the same mixture of solvents.

Reference solution (b). Dissolve 25 mg of the substance to be examined and 8 mg of *rifamycin S CRS* in a mixture of equal volumes of a 3.9 g/l solution of *sodium dihydrogen phosphate R*, adjusted to pH 3.0 with *phosphoric acid R*, and *acetonitrile R* and dilute to 250.0 ml with the same mixture of solvents.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min the following solutions, prepared and maintained at a temperature not lower than 20 °C:

Mobile phase A. Mix 10 volumes of *acetonitrile R* and 90 volumes of a 3.9 g/l solution of *sodium dihydrogen phosphate R*, adjusted to pH 7.5 with *dilute sodium hydroxide solution R*,

Mobile phase B. Mix 70 volumes of *acetonitrile R* and 30 volumes of a 3.9 g/l solution of *sodium dihydrogen phosphate R*, adjusted to pH 7.5 with *dilute sodium hydroxide solution R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 40	80 → 20	20 → 80	linear gradient
40 - 45	20	80	isocratic
45 - 47	20 → 80	80 → 20	linear gradient
47 - 55	80	20	re-equilibration

- as detector a spectrophotometer set at 254 nm,
- a 20 µl loop injector.

Inject reference solution (a). When the chromatogram is recorded in the prescribed conditions, the substances elute in the following order: rifamycin B, rifamycin SV, rifamycin S. Inject reference solution (b). Adjust the sensitivity of the system so that the height of the peak corresponding to rifamycin S in the chromatogram obtained is at least 50 per cent of the full scale of the recorder. The test is not valid unless the resolution between the peaks corresponding to rifamycin SV and rifamycin S is at least 5.0. Inject the test solution and reference solution (a). In the chromatogram obtained with the test solution: the area of any peak corresponding to rifamycin B is not greater than that of the peak due to rifamycin B in the chromatogram obtained with reference solution (a) (0.5 per cent); the area of any peak corresponding to rifamycin S is not greater than that of the peak due to rifamycin S in the chromatogram obtained with reference solution (a) (2 per cent); the sum of the areas of all the peaks, apart from the principal peak and any peaks corresponding to rifamycin B and rifamycin S, is not greater than the area of the peak corresponding to rifamycin S in the chromatogram obtained with reference solution (a) (2 per cent). Disregard any peak with an area less than 0.05 times that of the area of the peak corresponding to rifamycin S in the chromatogram obtained with reference solution (a).

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (2.5.12): 12.0 per cent to 17.0 per cent, determined on 0.200 g by the semi-micro determination of water.

Bacterial endotoxins (2.6.14): less than 0.50 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for removal of bacterial endotoxins.

ASSAY

Carry out the microbiological assay of antibiotics (2.7.2).

STORAGE

Store in an airtight container, protected from light at a temperature of 2 °C to 8 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

A. rifamycin B,

B. R = R' = =O: rifamycin S,

C. -R- = -O-CO-CH₂-O-, R' = =O: rifamycin O.

01/2005:2020

RILMENIDINE DIHYDROGEN PHOSPHATE

Rilmenidini dihydrogenophosphas

C₁₀H₁₉N₂O₅P

M_r 278.2

DEFINITION

N-(Dicyclopropylmethyl)-4,5-dihydro-oxazol-2-amine dihydrogen phosphate.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: freely soluble in water, slightly soluble in alcohol, practically insoluble in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: *Ph. Eur. reference spectrum of rilmenidine dihydrogen phosphate.*

- B. Dissolve 10 mg in *water R* and dilute to 1 ml with the same solvent. The solution gives reaction (b) of phosphates (2.3.1).

TESTS

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 60.0 mg of the substance to be examined in *water R* and dilute to 20.0 ml with the same solvent.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *water R* and dilute 10.0 ml of this solution to 50.0 ml with the same solvent.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 20.0 ml with *water R*.

Reference solution (c). Dissolve 15.0 mg of *rilmenidine for system suitability CRS* in *water R* and dilute to 5.0 ml with the same solvent.

Column:

- **size:** $l = 0.15$ m, $\varnothing = 3$ mm,
- **stationary phase:** base-deactivated octadecylsilyl silica gel for chromatography *R* (5 μ m) with a pore size of 10 nm and a carbon loading of 25 per cent,
- **temperature:** 40 °C.

Mobile phase:

- **mobile phase A:** dissolve 3 g of *sodium heptanesulphonate R* in *water R* and dilute to 860 ml with the same solvent; add 130 ml of *methanol R2*, 10 ml of *tetrahydrofuran for chromatography R* and 1.0 ml of *phosphoric acid R*,
- **mobile phase B:** dissolve 3 g of *sodium heptanesulphonate R* in *water R* and dilute to 600 ml with the same solvent; add 350 ml of *acetonitrile for chromatography R*, 50 ml of *tetrahydrofuran for chromatography R* and 1.0 ml of *phosphoric acid R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 14	100 → 0	0 → 100
14 - 15	0 → 100	100 → 0
15 - 30	100	0

Flow rate: 1 ml/min.

Detection: spectrophotometer at 205 nm.

Injection: 20 μ l.

Relative retention with reference to *rilmenidine* (retention time = about 13 min): impurity A = about 0.6; impurity B = about 0.9; impurity C = about 1.4.

With these conditions the inflexion of the baseline, corresponding to the beginning of the gradient, appears on the recorder after a minimum time t of 5 min. If this is not the case ($t < 5$ min) modify the chromatographic sequence by adding an isocratic elution with 100 per cent of mobile phase A for a time corresponding to (5- t) min before the linear gradient.

System suitability: reference solution (c):

- **peak-to-valley ratio:** minimum 3, where H_p = height above the baseline of the peak due to impurity B and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to *rilmenidine*.

Limits:

- **any impurity:** not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),

- **total:** not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),
- **disregard limit:** area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven *in vacuo* at 50 °C over *diphosphorus pentoxide R* for 2 h.

ASSAY

Dissolve 0.200 g in 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 *M perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 *M perchloric acid* is equivalent to 27.82 mg of $C_{10}H_{19}N_2O_5P$.

IMPURITIES

Specified impurities: A, B, C.

A. R = OH: 1-(dicyclopropylmethyl)-3-(2-hydroxyethyl)urea,

B. R = Cl: 1-(2-chloroethyl)-3-(dicyclopropylmethyl)urea,

C. *N*,3-bis(dicyclopropylmethyl)oxazolidin-2-imine.

01/2005:1559

RISPERIDONE

Risperidonum

$C_{23}H_{27}FN_4O_2$

M_r 410.5

DEFINITION

3-[2-[4-(6-Fluoro-1,2-benzisoxazol-3-yl)piperidin-1-yl]ethyl]-2-methyl-6,7,8,9-tetrahydro-4*H*-pyrido[1,2-*a*]pyrimidin-4-one.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, freely soluble in methylene chloride, sparingly soluble in ethanol (96 per cent). It dissolves in dilute acid solutions.

It shows polymorphism.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: risperidone CRS.

If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in *acetone R*, evaporate to dryness and record new spectra using the residues.

TESTS

Appearance of solution. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Dissolve 0.1 g in a 7.5 g/l solution of *tartaric acid R* and dilute to 100 ml with the same acid solution.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *risperidone for system suitability CRS* (containing impurities A, B, C, D and E) in *methanol R* and dilute to 1.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol R*. Dilute 5.0 ml of this solution to 25.0 ml with *methanol R*.

Column:

- size: $l = 0.10$ m, $\varnothing = 4.6$ mm,
- stationary phase: base-deactivated octadecylsilyl silica gel for chromatography *R* (3 μ m).

Mobile phase:

- mobile phase A: 5 g/l solution of ammonium acetate *R*,
- mobile phase B: *methanol R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 2	70	30
2 - 17	70 $\rightarrow$ 30	30 $\rightarrow$ 70
17 - 22	30	70
22 - 23	30 $\rightarrow$ 70	70 $\rightarrow$ 30
23 - 27	70	30

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 260 nm.

Injection: 10 μ l.

Relative retention with reference to risperidone (retention time = about 12 min): impurity A = about 0.69; impurity B = about 0.75; impurity C = about 0.81; impurity D = about 0.94; impurity H = about 0.96; impurity G = about 1.04; impurity E = about 1.12; impurity F = about 1.32; impurity I = about 1.60.

System suitability: reference solution (a):

- peak-to-valley ratio: minimum 1.5, where H_p = height above the baseline of the peak due to impurity D and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to risperidone,

- the chromatogram obtained is similar to the chromatogram supplied with *risperidone for system suitability CRS*.

Limits:

- impurities A, B, C, D, E: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),
- any other impurity: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- total: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent),
- disregard limit: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 4 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Dissolve 0.160 g in 70 ml of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R* and titrate with 0.1 M *perchloric acid*. Determine the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 20.53 mg of $C_{23}H_{27}FN_4O_2$.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E.

Other detectable impurities: F, G, H, I.

A. R = F, X = N-OH: 3-[2-[4-(*E*)-(2,4-difluorophenyl)(hydroxyimino)methyl]piperidin-1-yl]ethyl]-2-methyl-6,7,8,9-tetrahydro-4*H*-pyrido[1,2-*a*]pyrimidin-4-one,

B. R = F, X = N-OH: 3-[2-[4-(*Z*)-(2,4-difluorophenyl)(hydroxyimino)methyl]piperidin-1-yl]ethyl]-2-methyl-6,7,8,9-tetrahydro-4*H*-pyrido[1,2-*a*]pyrimidin-4-one,

G. R = OH, X = O: 3-[2-[4-(4-fluoro-2-hydroxybenzoyl)piperidin-1-yl]ethyl]-2-methyl-6,7,8,9-tetrahydro-4*H*-pyrido[1,2-*a*]pyrimidin-4-one,

H. R = F, X = O: 3-[2-[4-(2,4-difluorobenzoyl)piperidin-1-yl]ethyl]-2-methyl-6,7,8,9-tetrahydro-4*H*-pyrido[1,2-*a*]pyrimidin-4-one,

- C. R1 = R3 = H, R2 = OH, R4 = F: (9*RS*)-3-[2-[4-(6-fluoro-1,2-benzisoxazol-3-yl)piperidin-1-yl]ethyl]-9-hydroxy-2-methyl-6,7,8,9-tetrahydro-4*H*-pyrido[1,2-*a*]pyrimidin-4-one,
- D. R1 = R2 = R4 = H, R3 = F: 3-[2-[4-(5-fluoro-1,2-benzisoxazol-3-yl)piperidin-1-yl]ethyl]-2-methyl-6,7,8,9-tetrahydro-4*H*-pyrido[1,2-*a*]pyrimidin-4-one,
- E. R1 = CH₃, R2 = R3 = H, R4 = F: (6*RS*)-3-[2-[4-(6-fluoro-1,2-benzisoxazol-3-yl)piperidin-1-yl]ethyl]-2,6-dimethyl-6,7,8,9-tetrahydro-4*H*-pyrido[1,2-*a*]pyrimidin-4-one,

- F. 2-[2-methyl-4-oxo-6,7,8,9-tetrahydro-4*H*-pyrido[1,2-*a*]pyrimidin-3-yl]ethyl 4-(6-fluoro-1,2-benzisoxazol-3-yl)piperidin-1-carboxylate,

- I. 3-[2-[4-[4-fluoro-2-[4-(6-fluoro-1,2-benzisoxazol-3-yl)piperidin-1-yl]benzoyl]piperidin-1-yl]ethyl]-2-methyl-6,7,8,9-tetrahydro-4*H*-pyrido[1,2-*a*]pyrimidin-4-one.

IDENTIFICATION

- A. The calyx is joined in the lower half to form an urceolate structure, the upper half dividing to form 5 long acuminate recurved tips. The tips have a prominent, slightly protruding midrib and a large, thick nectary gland about 1 mm in diameter. The epicalyx consist of 8 to 12 small, obovate leaflets which are adnate to the base of the calyx. The calyx and epicalyx are fleshy, dry, easily fragmented and coloured bright-red to deep-purple, somewhat lighter at the base of the inner side.
- B. Reduce to a powder (355). The powder is red to purplish-red. Examine under a microscope using *chloral hydrate solution R*. The powder shows predominantly red coloured fragments of the parenchyme containing numerous crystal clusters of calcium oxalate and, sporadically, mucilage filled cavities, sometimes associated with polygonal epidermal cells and anisocytic stomata (2.8.3); numerous fragments of vascular bundles with spiral and reticulate vessels; sclerenchymatous fibres with a wide lumen; rarely, rectangular, pitted parenchymatous cells; fragments of unicellular, smooth, bent covering trichomes and occasional glandular trichomes; rounded pollen grains with spiny exine.
- C. Thin-layer chromatography (2.2.27).

Test solution. To 1.0 g of the powdered drug (355) add 10 ml of *alcohol (60 per cent) V/V R*. Shake for 15 min and filter.

Reference solution. Dissolve 2.5 mg of *quinaldine red R* in 10 ml of *alcohol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *acetic acid R, water R, butanol R* (15:30:60 *V/V/V*).

Application: 20 µl, as bands.

Development: over a path of 10 cm.

Drying: in air.

Detection: examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference and test solutions.

Top of the plate	
Quinaldine red: an orange red zone	A pale violet zone A violet-blue zone A violet-blue zone A violet-blue zone
Reference solution	Test solution

01/2005:1623

ROSELLE

Hibisci sabdariffae flos

DEFINITION

Whole or cut dried calyces and epicalyces of *Hibiscus sabdariffa* L. collected during fruiting.

Content: minimum 13.5 per cent of acids, expressed as citric acid (C₆H₈O₇; *M_r* 192.1) (dried drug).

CHARACTERS

Acidic taste.

Macroscopic and microscopic characters described under identification tests A and B.

TESTS

Foreign matter (2.8.2): maximum 2 per cent of fragments of fruits: red funicles and parts of the 5 caverned capsule with yellowish-grey pericarp, whose thin walls consist of several layers of differently directed fibres; flattened, reniform seeds with a dotted surface.

Loss on drying (2.2.32): maximum 11.0 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100-105 °C for 2 h.

Total ash (2.4.16): maximum 10.0 per cent.

Colouring power: reduce the drug to a coarse powder (1400) and mix 100 g of drug. Reduce about 10 g of this mixture to a powder (355). To 1.0 g of the powdered drug (355) add 25 ml of boiling *water R* in a 100 ml flask and heat for 15 min on a water-bath with frequent shaking. Filter the

hot mixture into a 50 ml graduated flask; rinse successively the 100 ml flask and the filter 3 times with 5 ml of warm *water R*. After cooling dilute to 50 ml with *water R*.

Dilute 5 ml of this solution to 50 ml with *water R*. Measure the absorbance (2.2.25) at 520 nm using *water R* as the compensation liquid. The absorbance is not less than 0.350 for the whole drug and not less than 0.250 for the cut drug.

ASSAY

Shake 1.000 g of the powdered drug (355) with 100 ml of *carbon dioxide free water R* for 15 min. Filter. To 50.0 ml of the filtrate add 100 ml of *carbon dioxide free water R*. Titrate with 0.1 M *sodium hydroxide* until pH 7.0, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *sodium hydroxide* is equivalent to 6.4 mg of citric acid.

01/2005:1560

ROSEMARY LEAF

Rosmarini folium

DEFINITION

Whole, dried leaf of *Rosmarinus officinalis* L.

Content:

- minimum 12 ml/kg of essential oil (anhydrous drug),
- minimum 3 per cent of total hydroxycinnamic derivatives, expressed as rosmarinic acid ($C_{18}H_{16}O_8$; M_r 360) (anhydrous drug).

CHARACTERS

Strongly aromatic odour.

Macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- The leaves are sessile, tough, linear to linear-lanceolate, 1 cm to 4 cm long and 2 mm to 4 mm wide, with recurved edges. The upper surface is dark green, glabrous and grainy, the lower surface is greyish-green and densely tomentose with a prominent midrib.
- Reduce to a powder (355). The powder is greyish-green to yellowish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows fragments of lower epidermis with straight to sinuous-walled cells and numerous diacytic stomata (2.8.3); fragments of the upper epidermis with straight-walled cells, slightly thickened and pitted, and an underlying hypodermis composed of large, irregular cells with thickened and beaded anticlinal walls; fragments in sectional view showing the hypodermal cells extending across the lamina at intervals, separating the one or two-layered palisade into large, crescent-shaped areas; numerous multicellular, extensively branched, covering trichomes of the lower epidermis and rare conical covering trichomes of the upper epidermis; glandular trichomes of 2 types, the majority with a short, unicellular stalk and a radiate head composed of 8 cells, others, less abundant, with a unicellular stalk and a spherical, unicellular or bicellular head.

C. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 20 µl of the oil obtained in the assay in 1 ml of *hexane R*.

Reference solution. Dissolve 5 mg of *borneol R*, 5 mg of *bornyl acetate R* and 10 µl of *cineole R* in 1 ml of *hexane R*.

Plate: TLC silica gel G plate R.

Mobile phase: *ethyl acetate R*, *toluene R* (5:95 V/V).

Application: 10 µl, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with *anisaldehyde solution R*. Heat at 100-105 °C for 10 min. Examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
Bornyl acetate: a yellowish-brown zone	A red zone A yellowish-brown zone of low intensity A coloured zone of low intensity
Cineole: a violet zone	A violet zone Coloured zones of low intensity
Borneol: a violet-brown zone	A violet-brown zone A coloured zone of low intensity
Reference solution	Test solution

D. Thin-layer chromatography (2.2.27).

Test solution. Grind 1.0 g of the drug in 10 ml of *methanol R* and filter.

Reference solution. Dissolve 5.0 mg of *rosmarinic acid R* and 1.0 mg of *caffeic acid R* in 10 ml of *methanol R*.

Plate: TLC silica gel plate R.

Mobile phase: *anhydrous formic acid R*, *acetone R*, *methylene chloride R* (8.5:25:85 V/V/V).

Application: 10 µl of the test solution and 20 µl of the reference solution, as bands.

Development: over a path of 8 cm.

Drying: in air.

Detection: examine in ultraviolet light at 365 nm.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
Caffeic acid: a light blue fluorescent zone Rosmarinic acid: a light blue fluorescent zone	A pink fluorescent zone A blue fluorescent zone of low intensity An intense light blue fluorescent zone
Reference solution	Test solution

TESTS

Foreign matter (2.8.2): maximum 5 per cent of stems and maximum 2 per cent of other foreign matter.

Water (2.2.13): maximum 100 ml/kg, determined on 20.0 g of the powdered drug (355).

Total ash (2.4.16): maximum 9.0 per cent.

ASSAY

Total hydroxycinnamic derivatives

Stock solution. To 0.200 g of the powdered drug (355) add 80 ml of *alcohol (50 per cent V/V) R*. Boil in a water-bath under a reflux condenser for 30 min. Allow to cool and filter. Rinse the filter with 10 ml of *alcohol (50 per cent V/V) R*. Combine the filtrate and the rinsings in a volumetric flask and dilute to 100.0 ml with *alcohol (50 per cent V/V) R*.

Test solution. To 1.0 ml of the stock solution add 2 ml of 0.5 M hydrochloric acid, 2 ml of a solution prepared by dissolving 10 g of sodium nitrite R and 10 g of sodium molybdate R in 100 ml of water R and then add 2 ml of dilute sodium hydroxide solution R and dilute to 10.0 ml with water R; mix.

Compensation solution. Dilute 1.0 ml of the stock solution to 10.0 ml with water R.

Measure immediately the absorbance (2.2.25) of the test solution at 505 nm.

Calculate the percentage content of total hydroxycinnamic derivatives, expressed as rosmarinic acid, from the expression:

$$\frac{A \times 2.5}{m}$$

i.e. taking the specific absorbance of rosmarinic acid to be 400.

A = absorbance of the test solution at 505 nm,

m = mass of the substance to be examined, in grams.

Essential oil (2.8.12). Use 25.0 g of the crushed drug, a 1000 ml flask and 300 ml of water R as the distillation liquid. Distil at a rate of 2-3 ml/min for 3 h.

01/2005:1846

ROSEMARY OIL

Rosmarini aetheroleum

DEFINITION

Essential oil obtained by steam distillation from the flowering aerial parts of *Rosmarinus officinalis* L.

CHARACTERS

Appearance: clear, mobile, colourless to pale yellow liquid with a characteristic odour.

IDENTIFICATION

First identification: B.

Second identification: A.

A. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 0.5 ml of the substance to be examined in toluene R and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 50 mg of borneol R, 50 mg of bornyl acetate R and 100 µl of cineole R in toluene R and dilute to 10 ml with the same solvent.

Plate: TLC silica gel plate R.

Mobile phase: ethyl acetate R, toluene R (5:95 V/V).

Application: 10 µl, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray the plate with vanillin reagent R and heat the plate at 100-105 °C for 10 min. Examine immediately in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, several violet-blue to violet-grey zones of medium intensity (terpene alcohols) are present in the lower third of the chromatogram obtained with the test solution.

Top of the plate	
	An intense violet zone
	A violet-grey zone
Bornyl acetate: a bluish-grey zone of low intensity	A bluish-grey zone of low intensity (bornyl acetate)
	A violet-pink zone
Cineole: an intense blue zone	An intense blue zone (cineole)
Borneol: a violet-blue zone of medium intensity	A violet-blue zone of medium intensity (borneol)
Reference solution	Test solution

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results: the characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Relative density (2.2.5): 0.895 to 0.920.

Refractive index (2.2.6): 1.464 to 1.473.

Optical rotation (2.2.7): −5° to +8°.

Acid value (2.5.1): maximum 1.0.

Chromatographic profile. Gas chromatography (2.2.28): use the normalisation procedure.

Test solution. Dissolve 0.20 ml of the substance to be examined in hexane R and dilute to 10.0 ml with the same solvent.

Reference solution. Dissolve 20 µl of α-pinene R, 10 mg of camphene R, 20 µl of β-pinene R, 10 µl of β-myrcene R, 20 µl of limonene R, 50 µl of cineole R, 10 µl of p-cymene R, 50 mg of camphor R, 30 mg of bornyl acetate R, 10 mg of α-terpineol R, 10 mg of borneol R and 10 µl of verbenone R in hexane R and dilute to 10.0 ml with the same solvent.

Column:

- **material:** fused silica,
- **size:** $l = 30$ m (a film thickness of 1 µm may be used) to 60 m (a film thickness of 0.2 µm may be used), $\varnothing = 0.25$ -0.53 mm,
- **stationary phase:** macrogol 20 000 R.

Carrier gas: helium for chromatography R.

Flow rate: 1 ml/min.

Split ratio: 1:50.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 10	50
	10 - 85	50 → 200
	85 - 110	200
Injection port		200
Detector		250

Detection: flame ionisation.

Injection: 1 µl.

Elution order: order indicated in the composition of the reference solution. Record the retention times of these substances.

System suitability: reference solution:

01/2005:1146

- *resolution*: minimum 1.5 between the peaks due to limonene and cineole and minimum 1.5 between the peaks due to α -terpineol and borneol.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

Determine the percentage content of these components.

For rosemary oil, Spanish type, the percentages are within the following ranges:

- *α -pinene*: 18 per cent to 26 per cent,
- *camphene*: 8.0 per cent to 12.0 per cent,
- *β -pinene*: 2.0 per cent to 6.0 per cent,
- *β -myrcene*: 1.5 per cent to 5.0 per cent,
- *limonene*: 2.5 per cent to 5.0 per cent,
- *cineole*: 16.0 per cent to 25.0 per cent,
- *p-cymene*: 1.0 per cent to 2.2 per cent,
- *camphor*: 13.0 per cent to 21.0 per cent,
- *bornyl acetate*: 0.5 per cent to 2.5 per cent,
- *α -terpineol*: 1.0 per cent to 3.5 per cent,
- *borneol*: 2.0 per cent to 4.5 per cent,
- *verbenone*: 0.7 per cent to 2.5 per cent.

For rosemary oil, Moroccan and Tunisian type, the percentages are within the following ranges:

- *α -pinene*: 9.0 per cent to 14.0 per cent,
- *camphene*: 2.5 per cent to 6.0 per cent,
- *β -pinene*: 4.0 per cent to 9.0 per cent,
- *β -myrcene*: 1.0 per cent to 2.0 per cent,
- *limonene*: 1.5 per cent to 4.0 per cent,
- *cineole*: 38.0 per cent to 55.0 per cent,
- *p-cymene*: 0.8 per cent to 2.5 per cent,
- *camphor*: 5.0 per cent to 15.0 per cent,
- *bornyl acetate*: 0.1 per cent to 1.5 per cent,
- *α -terpineol*: 1.0 per cent to 2.6 per cent,
- *borneol*: 1.5 per cent to 5.0 per cent,
- *verbenone*: maximum 0.4 per cent.

STORAGE

In a well-filled, airtight container, protected from light, at a temperature not exceeding 25 °C.

LABELLING

The label states that the content is Spanish type or Moroccan and Tunisian type.

ROXITHROMYCIN

Roxithromycinum

C₄₁H₇₆N₂O₁₅

M_r 837

DEFINITION

(3*R*,4*S*,5*S*,6*R*,7*R*,9*R*,11*S*,12*R*,13*S*,14*R*)-4-[(2,6-Dideoxy-3-C-methyl-3-*O*-methyl- α -L-ribo-hexopyranosyl)oxy]-14-ethyl-7,12,13-trihydroxy-10-[(*E*)-[(2-methoxyethoxy)methoxy]imino]-3,5,7,9,11,13-hexamethyl-6-[[3,4,6-trideoxy-3-(dimethylamino)- β -D-xyllo-hexopyranosyl]oxy]oxacyclotetradecan-2-one (erythromycin 9-(*E*)-[O-[(2-methoxyethoxy)methyl]oxime]).

Content: 96.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white, crystalline powder.

Solubility: very slightly soluble in water, freely soluble in acetone, in alcohol and in methylene chloride. It is slightly soluble in dilute hydrochloric acid.

It shows polymorphism.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: roxithromycin CRS.

If the spectra obtained shows differences, prepare further spectra using 90 g/l solutions in *methylene chloride R*.

B. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (a).

TESTS

Appearance of solution. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Dissolve 0.2 g in *methanol R* and dilute to 20 ml with the same solvent.

Specific optical rotation (2.2.7): –93 to –96 (anhydrous substance).

Dissolve 0.500 g in *acetone R* and dilute to 50.0 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Solution A. Mix 30 volumes of *acetonitrile R* and 70 volumes of a 48.6 g/l solution of *ammonium dihydrogen phosphate R*, adjusted to pH 5.3 with *dilute sodium hydroxide solution R*.

Test solution. Dissolve 50.0 mg of the substance to be examined in solution A and dilute to 25.0 ml with solution A.

Reference solution (a). Dissolve 50.0 mg of *roxithromycin CRS* in solution A and dilute to 25.0 ml with solution A.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with solution A.

Reference solution (c). Dissolve 2.0 mg of *roxithromycin for system suitability CRS* in solution A and dilute to 1.0 ml with solution A.

Reference solution (d). Dilute 1.0 ml of *toluene R* to 100.0 ml with *acetonitrile R*. Dilute 0.2 ml of this solution to 200.0 ml with solution A.

Column:

- **size:** $l = 0.15$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** spherical *end-capped octadecylsilyl silica gel for chromatography R* (5 μ m) with a 10 nm pore size and a carbon loading of about 19 per cent,
- **temperature:** 15 °C.

Mobile phase:

- **mobile phase A:** mix 26 volumes of *acetonitrile R* and 74 volumes of a 59.7 g/l solution of *ammonium dihydrogen phosphate R*, adjusted to pH 4.3 with *dilute sodium hydroxide solution R*,
- **mobile phase B:** *water R*, *acetonitrile R* (30:70 V/V),

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 50	100	0
50 - 51	100 → 90	0 → 10
51 - 80	90	10
80 - 81	90 → 100	10 → 0
81 - 100	100	0

Flow rate: 1.1 ml/min.

Detection: spectrophotometer at 205 nm.

Injection: 20 μ l, using an injector maintained at 8 °C, of the test solution and reference solutions (b), (c) and (d).

Relative retention with reference to roxithromycin (retention time = about 22 min): impurity A = about 0.28; impurity B = about 0.31; impurity C = about 0.33; impurity D = about 0.62; impurity E = about 0.67; impurity F = about 0.83; impurity G = about 1.15; impurity K = about 1.7; impurity H = about 1.85; impurity J = about 2.65; impurity I = about 3.1.

System suitability: reference solution (c):

- **peak-to-valley ratio:** minimum 2.0, where H_p = height above the baseline of the peak due to impurity G and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to roxithromycin.

Limits:

- **impurity G:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent),
- **impurities A, B, C, D, E, F, H, I, J:** for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
- **total:** not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent),

- **disregard limit:** 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent). Disregard any peak due to toluene (use reference solution (d) to identify it).

Heavy metals (2.4.8): maximum 10 ppm.

Dissolve 2.0 g in a mixture of 15 volumes of *water R* and 85 volumes of *acetone R* and dilute to 20 ml with the same mixture of solvents. 12 ml of the solution complies with the limit test B. Prepare the standard using lead standard solution (1 ppm Pb) obtained by diluting *lead standard solution (100 ppm Pb) R* with a mixture of 15 volumes of *water R* and 85 volumes of *acetone R*.

Water (2.5.12): maximum 3.0 per cent, determined on 0.200 g.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances, with the following modifications.

Column:

- **size:** $l = 0.25$ m.

Mobile phase: mix 307 volumes of *acetonitrile R* and 693 volumes of a 49.1 g/l solution of *ammonium dihydrogen phosphate R* adjusted to pH 5.3 with *dilute sodium hydroxide solution R*.

Flow rate: 1.5 ml/min.

Injection: test solution and reference solutions (a) and (c).

Retention time: roxithromycin = about 12 min.

System suitability: reference solution (c):

- **peak-to-valley ratio:** minimum 1.5, where H_p = height above the baseline of the peak due to impurity G and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to roxithromycin.

STORAGE

In an airtight container.

IMPURITIES

Specified impurities: A, B, C, D, E, F, G, H, I, J.

Other detectable impurities: K.

- A. (3*R*,4*S*,5*S*,6*R*,7*R*,9*R*,11*R*,12*R*,13*S*,14*R*)-4-[(2,6-dideoxy-3-*C*-methyl-3-*O*-methyl- α -L-*ribo*-hexopyranosyl)oxy]-14-ethyl-7,12,13-trihydroxy-3,5,7,9,11,13-hexamethyl-6-[[3,4,6-trideoxy-3-(dimethylamino)- β -D-*xylo*-hexopyranosyl]oxy]oxacyclotetradecane-2,10-dione (erythromycin A),

- B. 3-*O*-de(2,6-dideoxy-3-*C*-methyl-3-*O*-methyl- α -L-*ribo*-hexopyranosyl)erythromycin 9-(*E*)-[*O*-(2-methoxyethoxy)methyl]oxime],

C. R = H: erythromycin 9-(*E*)-oxime,

G. R = CH₂-O-CH₂-O-CH₂-CH₂-OCH₃: erythromycin
9-(*E*)-[O-[(2-methoxyethoxy)methoxy]methyl]oxime],

J. R = CH₂-O-CH₂-CH₂Cl: erythromycin 9-(*E*)-[O-(2-chloroethoxy)methyl]oxime],

K. R = CH₂-O-CH₂-CH₂-O-CH₂OH: erythromycin
9-(*E*)-[O-[2-(hydroxymethoxy)ethoxy]methyl]oxime].

D. erythromycin 9-(Z)-[O-(2-methoxyethoxy)methyl]oxime],

E. R = H, R' = CH₃: 3''-O-demethylerythromycin
9-(*E*)-[O-[(2-methoxyethoxy)methyl]oxime],

F. R = CH₃, R' = H: 3'-*N*-demethylethromycin
9-(*E*)-[O-[(2-methoxyethoxy)methyl]oxime],

H. R = R' = H: 12-deoxyerythromycin 9-(*E*)-[O-[(2-methoxyethoxy)methyl]oxime].

I. R = OH, R' = CH₂-O-CH₂-CH₂-OCH₃: 2'-O-[(2-methoxyethoxy)methyl]erythromycin 9-(E)-[O-[(2-methoxyethoxy)methyl]oxime].

01/2005:1795

RUTOSIDE TRIHYDRATE

Rutosidum trihydricum

$$\text{C}_{27}\text{H}_{30}\text{O}_{16}, 3\text{H}_2\text{O}$$

M. 665

DEFINITION

3-[[6-*O*-(6-Deoxy- α -L-mannopyranosyl)- β -D-glucopyranosyl]oxy]-2-(3,4-dihydroxyphenyl)-5,7-dihydroxy-4*H*-1-benzopyran-4-one.

Content: 95.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: yellow or greenish-yellow, crystalline powder.

Solubility: practically insoluble in water, soluble in methanol, sparingly soluble in ethanol, practically insoluble in methylene chloride. It dissolves in solutions of alkali hydroxides.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

A. Dissolve 50.0 mg in *methanol R*, dilute to 250.0 ml with the same solvent and filter if necessary. Dilute 5.0 ml of the solution to 50.0 ml with *methanol R*. Examined between 210 nm and 450 nm (2.2.25), the solution shows 2 absorption maxima, at 257 nm and 358 nm. The specific absorbance at the maximum at 358 nm is 305 to 330, calculated with reference to the anhydrous substance.

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: rutoside trihydrate CRS.

C. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 25 mg of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution. Dissolve 25 mg of *rutoside trihydrate CRS* in *methanol R* and dilute to 10.0 ml with the same solvent.

Plate: TLC silica gel G plate *R*.

Mobile phase: *butanol R*, *anhydrous acetic acid R*, *water R*, *methyl ethyl ketone R*, *ethyl acetate R* (5:10:10:30:50 *V/V/V/V/V*).

Application: 10 µl.

Development: over a path of 10 cm.

Drying: in air.

Detection: spray with a mixture of 7.5 ml of a 10 g/l solution of *potassium ferricyanide R* and 2.5 ml of *ferric chloride solution R1* and examine for 10 min.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

- D. Dissolve 10 mg in 5 ml of *alcohol R*, add 1 g of *zinc R* and 2 ml of *hydrochloric acid R1*. A red colour develops.

TESTS

Light absorbing impurities (2.2.25): maximum 0.10 at wavelengths between 450 nm and 800 nm.

Dissolve 0.200 g in 40 ml of *2-propanol R*. Stir for 15 min, dilute to 50.0 ml with *2-propanol R* and filter.

Substances insoluble in methanol: maximum 3 per cent.

Shake 2.5 g for 15 min in 50 ml of *methanol R* at 20–25 °C. Filter under reduced pressure through a sintered-glass filter (1.6) previously dried for 15 min at 100–105 °C, allowed to cool in a desiccator and tared. Wash the filter 3 times with 20 ml of *methanol R*. Dry the filter for 30 min at 100–105 °C. Allow to cool and weigh. The residue weighs a maximum of 75 mg.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.10 g of the substance to be examined in 20 ml of *methanol R* and dilute to 100.0 ml with mobile phase B.

Reference solution (a). Dissolve 10.0 mg of *rutoside trihydrate CRS* in 10.0 ml of *methanol R*.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 50.0 ml with mobile phase B.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.0$ mm,
- **stationary phase:** *octylsilyl silica gel for chromatography R* (5 µm),
- **temperature:** 30 °C.

Mobile phase:

- **mobile phase A:** mix 5 volumes of *tetrahydrofuran R* with 95 volumes of a 15.6 g/l solution of *sodium dihydrogen phosphate R* adjusted to pH 3.0 with *phosphoric acid R*,
- **mobile phase B:** mix 40 volumes of *tetrahydrofuran R* with 60 volumes of a 15.6 g/l solution of *sodium dihydrogen phosphate R* adjusted to pH 3.0 with *phosphoric acid R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 10	50 → 0	50 → 100
10 - 15	0	100
15 - 16	0 → 50	100 → 50
16 - 20	50	50

Flow rate: 1 ml/min.

Detection: spectrophotometer at 280 nm.

Injection: 20 µl.

Relative retention with reference to rutoside (retention time = about 7 min): impurity B = about 1.1; impurity A = about 1.2; impurity C = about 2.5.

System suitability: reference solution (a):

- **peak-to-valley ratio:** minimum 10, where H_p = height above the baseline of the peak due to impurity B and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to rutoside.

Limits: locate the impurities by comparison with the chromatogram provided with *rutoside trihydrate CRS*.

- **correction factors:** for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity A = 0.8; impurity C = 0.5,
- **impurity A:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent),
- **impurity B:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent),
- **impurity C:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent),
- **total:** not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (4.0 per cent),
- **disregard limit:** 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

Water (2.5.12): 7.5 per cent to 9.5 per cent, determined on 0.100 g.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 20 ml of *dimethylformamide R*. Titrate with 0.1 M *tetrabutylammonium hydroxide*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *tetrabutylammonium hydroxide* is equivalent to 30.53 mg of $C_{27}H_{30}O_{16}$.

STORAGE

Protected from light.

IMPURITIES

A. 2-(3,4-dihydroxyphenyl)-3-(β -D-glucofuranosyloxy)-5,7-dihydroxy-4*H*-1-benzopyran-4-one (isoquercitrin),

B. 3-[[6-*O*-(6-deoxy- α -L-mannopyranosyl)- β -D-glucopyranosyl]oxy]-5,7-dihydroxy-2-(4-hydroxyphenyl)-4*H*-1-benzopyran-4-one (kaempferol 3-rutinoside),

C. 2-(3,4-dihydroxyphenyl)-3,5,7-trihydroxy-4*H*-1-benzopyran-4-one (quercetin).

SACCHARIN

Saccharinum

C₇H₅NO₃SM_r 183.2

DEFINITION

1,2-Benzisothiazol-3(2H)-one 1,1-dioxide.

Content: 98.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white, crystalline powder or colourless crystals.*Solubility*: sparingly soluble in boiling water and in alcohol, slightly soluble in cold water. It dissolves in dilute solutions of alkali hydroxides and carbonates.

IDENTIFICATION

First identification: C.*Second identification*: A, B, D, E.A. A saturated solution, prepared without heating, turns *blue litmus paper R* red.

B. Melting point (2.2.14): 226 °C to 230 °C.

C. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.*Comparison*: saccharin CRS.D. Mix about 10 mg with about 10 mg of *resorcinol R*, add 0.25 ml of *sulphuric acid R* and carefully heat the mixture over a naked flame until a dark green colour is produced. Allow to cool, add 10 ml of *water R* and *dilute sodium hydroxide solution R* until an alkaline reaction is produced. An intense green fluorescence develops.E. To 0.2 g add 1.5 ml of *dilute sodium hydroxide solution R*, evaporate to dryness and heat the residue carefully until it melts, avoiding carbonisation. Allow to cool, dissolve the mass in about 5 ml of *water R*, add *dilute hydrochloric acid R* until a weak acid reaction is produced and filter, if necessary. To the filtrate add 0.2 ml of *ferric chloride solution R2*. A violet colour develops.

TESTS

Solution S. Dissolve 5.0 g in 20 ml of a 200 g/l solution of *sodium acetate R* and dilute to 25 ml with the same solution.**Appearance of solution.** Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).***o*- and *p*-Toluenesulphonamide.** Gas chromatography (2.2.28).*Internal standard solution.* Dissolve 25 mg of *caffeine R* in *methylene chloride R* and dilute to 100 ml with the same solvent.*Test solution.* Suspend 10.0 g of the substance to be examined in 20 ml of *water R* and dissolve using 5 ml to 6 ml of *strong sodium hydroxide solution R*. If necessary adjust the solution to pH 7-8 with 1 M *sodium hydroxide* or 1 M *hydrochloric acid* and dilute to 50 ml with *water R*. Shake the solution with 4 quantities, each of 50 ml, of *methylene**chloride R*. Combine the lower layers, dry over *anhydrous sodium sulphate R* and filter. Wash the filter and the sodium sulphate with 10 ml of *methylene chloride R*. Combine the solution and the washings and evaporate almost to dryness in a water-bath at a temperature not exceeding 40 °C. Using a small quantity of *methylene chloride R*, quantitatively transfer the residue into a suitable 10 ml tube, evaporate to dryness in a current of nitrogen and dissolve the residue in 1.0 ml of the internal standard solution.*Blank solution.* Evaporate 200 ml of *methylene chloride R* to dryness in a water-bath at a temperature not exceeding 40 °C. Dissolve the residue in 1 ml of *methylene chloride R*.*Reference solution.* Dissolve 20.0 mg of *o*-toluenesulphonamide *R* and 20.0 mg of *p*-toluenesulphonamide *R* in *methylene chloride R* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of the solution to 50.0 ml with *methylene chloride R*. Evaporate 5.0 ml of the final solution to dryness in a current of nitrogen. Dissolve the residue in 1.0 ml of the internal standard solution.*Column*:

- *material*: fused silica,
- *size*: *l* = 10 m, Ø = 0.53 mm,
- *stationary phase*: *polymethylphenylsiloxane R* (film thickness 2 µm).

Carrier gas: nitrogen for chromatography *R*.*Flow rate*: 10 ml/min.*Split ratio*: 1:2.*Temperature*:

- *column*: 180 °C,
- *injection port and detector*: 250 °C.

Detection: flame ionisation.*Injection*: 1 µl.*Order of elution*: *o*-toluenesulphonamide, *p*-toluenesulphonamide, caffeine.*System suitability*: reference solution:

- *resolution*: minimum of 1.5 between the peaks due to *o*-toluenesulphonamide and *p*-toluenesulphonamide.

Limits:

- *o*-toluenesulphonamide: the ratio of its area to that of the internal standard is not greater than the corresponding ratio in the chromatogram obtained with the reference solution (10 ppm),
- *p*-toluenesulphonamide: the ratio of its area to that of the internal standard is not greater than the corresponding ratio in the chromatogram obtained with the reference solution (10 ppm).

Heavy metals (2.4.8): maximum 20 ppm.Dilute 10 ml of solution S to 20 ml with *water R*. 12 ml of the solution complies with limit test A. Prepare the standard using *lead standard solution* (2 ppm Pb) *R*.**Loss on drying** (2.2.32): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 4 h.**Sulphated ash** (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in 25 ml of *alcohol R*, with slight heating if necessary. Add 25 ml of *water R* and 0.25 ml of *phenolphthalein solution R1*. Titrate with 0.1 M *sodium hydroxide*. Carry out a blank titration.1 ml of 0.1 M *sodium hydroxide* is equivalent to 18.32 mg of C₇H₅NO₃S.

01/2005:0787 ***o*- and *p*-Toluenesulphonamide**. Gas chromatography (2.2.28).

SACCHARIN SODIUM

Saccharinum natricum

$C_7H_4NNaO_3S$

M_r 205.2

DEFINITION

2-Sodio-1,2-benzisothiazol-3(2*H*)-one 1,1-dioxide.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance). It may contain a variable quantity of water.

CHARACTERS

Appearance: white, crystalline powder or colourless crystals, efflorescent in dry air.

Solubility: freely soluble in water, sparingly soluble in alcohol.

IDENTIFICATION

First identification: B, E.

Second identification: A, C, D, E.

A. To 5 ml of solution S (see Tests) add 3 ml of *dilute hydrochloric acid R*. A white precipitate is formed. Filter and wash with *water R*. Dry the precipitate at 100–105 °C. The melting point (2.2.14) is 226 °C to 230 °C.

B. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs; dry the substances at 100–105 °C before use.

Comparison: *saccharin sodium CRS*.

C. Mix about 10 mg with about 10 mg of *resorcinol R*, add 0.25 ml of *sulphuric acid R* and carefully heat the mixture over a naked flame until a dark green colour is produced. Allow to cool, add 10 ml of *water R* and *dilute sodium hydroxide solution R* until an alkaline reaction is produced. An intense green fluorescence develops.

D. To 0.2 g add 1.5 ml of *dilute sodium hydroxide solution R*, evaporate to dryness and heat the residue carefully until it melts, avoiding carbonisation. Allow to cool, dissolve the mass in about 5 ml of *water R*, add *dilute hydrochloric acid R* until a weak acid reaction is produced and filter, if necessary. To the filtrate add 0.2 ml of *ferric chloride solution R2*. A violet colour develops.

E. 0.5 ml of solution S gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Dissolve 5.0 g in 25 ml of *carbon dioxide-free water R*.

Acidity or alkalinity. To 10.0 ml of solution S add 5.0 ml of 0.005 *M sulphuric acid*. Heat to boiling and cool. Add 0.1 ml of *phenolphthalein solution R*. Not less than 4.5 ml and not more than 5.5 ml of 0.01 *M sodium hydroxide* is required to change the colour of the indicator to pink.

Internal standard solution. Dissolve 25 mg of *caffeine R* in *methylene chloride R* and dilute to 100 ml with the same solvent.

Test solution. Dissolve 10.0 g of the substance to be examined in 50 ml of *water R*. If necessary adjust the solution to pH 7–8 by addition of 1 *M sodium hydroxide* or 1 *M hydrochloric acid*. Shake the solution with 4 quantities, each of 50 ml, of *methylene chloride R*. Combine the lower layers, dry over *anhydrous sodium sulphate R* and filter. Wash the filter and the sodium sulphate with 10 ml of *methylene chloride R*. Combine the solution and the washings and evaporate almost to dryness in a water-bath at a temperature not exceeding 40 °C. Using a small quantity of *methylene chloride R*, quantitatively transfer the residue into a suitable 10 ml tube, evaporate to dryness in a current of *nitrogen R* and add 1.0 ml of the internal standard solution.

Blank solution. Evaporate 200 ml of *methylene chloride R* to dryness in a water-bath at a temperature not exceeding 40 °C. Dissolve the residue in 1 ml of *methylene chloride R*.

Reference solution. Dissolve 20.0 mg of *o*-toluenesulphonamide *R* and 20.0 mg of *p*-toluenesulphonamide *R* in *methylene chloride R* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of the solution to 50.0 ml with *methylene chloride R*. Evaporate 5.0 ml of the final solution to dryness in a current of *nitrogen R*. Take up the residue using 1.0 ml of the internal standard solution.

Column:

- **material:** fused silica,
- **size:** $l = 10$ m, $\varnothing = 0.53$ mm,
- **stationary phase:** *polymethylphenylsiloxane R* (film thickness 2 µm).

Carrier gas: *nitrogen for chromatography R*.

Flow rate: 10 ml/min.

Split ratio: 1:2.

Temperature:

- **column:** 180 °C,
- **injection port and detector:** 250 °C.

Detection: flame ionisation.

Injection: 1 µl.

Elution order: *o*-toluenesulphonamide, *p*-toluenesulphonamide, *caffeine*.

System suitability: reference solution:

- **resolution:** minimum of 1.5 between the peaks due to *o*-toluenesulphonamide and *p*-toluenesulphonamide.

Limits:

- ***o*-toluenesulphonamide:** the ratio of its area to that of the internal standard is not greater than the corresponding ratio in the chromatogram obtained with the reference solution (10 ppm),
- ***p*-toluenesulphonamide:** the ratio of its area to that of the internal standard is not greater than the corresponding ratio in the chromatogram obtained with the reference solution (10 ppm).

Heavy metals (2.4.8): maximum 20 ppm.

12 ml of solution S complies with limit test A. Prepare the standard using *lead standard solution* (2 ppm Pb) *R*.

Water (2.5.12): maximum 15.0 per cent, determined on 0.200 g.

ASSAY

Dissolve 0.150 g in 50 ml of *anhydrous acetic acid R*, with slight heating if necessary. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20). 1 ml of 0.1 M *perchloric acid* is equivalent to 20.52 mg of $C_7H_4NNaO_3S$.

STORAGE

In an airtight container.

01/2005:2088

SAFFLOWER OIL, REFINED

Carthami oleum raffinatum

DEFINITION

Fatty oil obtained from seeds of *Carthamus tinctorius* L. (type I) or from seeds of hybrids of *Carthamus tinctorius* L. (type II), by expression and/or extraction followed by refining. Type II refined safflower oil is rich in oleic acid. It may contain a suitable antioxidant.

CHARACTERS

Appearance: clear, viscous, yellow to pale yellow liquid.

Solubility: miscible with light petroleum (bp: 40-60 °C), practically insoluble in alcohol.

	Refined safflower oil (type I)	Refined safflower oil (type II)
Relative density	about 0.922	about 0.914
Refractive index	about 1.476	about 1.472

IDENTIFICATION

First identification: B.

Second identification: A.

- A. Carry out the identification of fatty oils by thin-layer chromatography (2.3.2). The chromatogram obtained is comparable with the type chromatogram for type I or type II refined safflower oil.
- B. It complies with the test for composition of fatty acids (see Tests).

TESTS

Acid value (2.5.1): maximum 0.5.

Peroxide value (2.5.5): maximum 10.0. Maximum 5.0, if intended for the manufacture of parenteral dosage forms.

Unsaponifiable matter (2.5.7): maximum 1.5 per cent, determined on 5.0 g.

Alkaline impurities (2.4.19). It complies with the test for alkaline impurities in fatty oils.

Composition of fatty acids (2.4.22, *Method A*). Use the mixture of calibrating substances in Table 2.4.22-3.

Composition of the fatty acid fraction of type I refined safflower oil:

- *saturated fatty acids of chain length less than C14*: maximum 0.2 per cent,
- *myristic acid*: maximum 0.2 per cent,
- *palmitic acid*: 4.0 per cent to 10.0 per cent,
- *stearic acid*: 1.0 per cent to 5.0 per cent,
- *oleic acid* (equivalent chain length on polyethyleneglycol adipate 18.3): 8.0 per cent to 21.0 per cent,
- *linoleic acid* (equivalent chain length on polyethyleneglycol adipate 18.9): 68.0 per cent to 83.0 per cent,

- *linolenic acid* (equivalent chain length on polyethyleneglycol adipate 19.7): maximum 0.5 per cent,
- *arachidic acid*: maximum 0.5 per cent,
- *eicosenoic acid* (equivalent chain length on polyethyleneglycol adipate 20.3): maximum 0.5 per cent,
- *behenic acid*: maximum 1.0 per cent.

Composition of the fatty acid fraction of type II refined safflower oil:

- *saturated fatty acids of chain length less than C14*: maximum 0.2 per cent,
- *myristic acid*: maximum 0.2 per cent,
- *palmitic acid*: 3.6 per cent to 6.0 per cent,
- *stearic acid*: 1.0 per cent to 5.0 per cent,
- *oleic acid* (equivalent chain length on polyethyleneglycol adipate 18.3): 70.0 per cent to 84.0 per cent,
- *linoleic acid* (equivalent chain length on polyethyleneglycol adipate 18.9): 7.0 per cent to 23.0 per cent,
- *linolenic acid* (equivalent chain length on polyethyleneglycol adipate 19.7): maximum 0.5 per cent,
- *arachidic acid*: maximum 1.0 per cent,
- *eicosenoic acid* (equivalent chain length on polyethyleneglycol adipate 20.3): maximum 1.0 per cent,
- *behenic acid*: maximum 1.2 per cent.

Brassicasterol (2.4.23): maximum 0.3 per cent of brassicasterol in the sterol fraction of the oil.

Water (2.5.32): maximum 0.1 per cent, determined on 5.00 g, if intended for use in the manufacture of parenteral dosage forms.

STORAGE

In a well-filled, airtight container, protected from light.

LABELLING

The label states:

- where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms,
- the name and concentration of any added antioxidant,
- the type of oil (type I or type II).

01/2005:1370

SAGE LEAF (*SALVIA OFFICINALIS*)*Salviae officinalis folium*

DEFINITION

Whole or cut dried leaves of *Salvia officinalis* L.

Content: minimum 15 ml/kg of essential oil for the whole drug and minimum 10 ml/kg of essential oil for the cut drug (anhydrous drug).

CHARACTERS

Sage leaf (*Salvia officinalis*) oil is rich in thujone.

Macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The lamina of whole sage leaf (*Salvia officinalis*) is about 2 cm to 10 cm long and 1 cm to 2 cm wide, oblong-ovate, elliptical. The margin is finely crenate to smooth. The apex is rounded or subacute and the base is shrunk at the petiole and rounded or cordate. The upper surface

01/2005:1561

is greenish-grey and finely granular; the lower surface is white and pubescent and shows a dense network of raised veinlets.

- B. Reduce to a powder (355). The powder is light grey to brownish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: very numerous articulated and bent trichomes with narrow elongated cells and a very thick cell at the base as well as fragments of these trichomes; fragments of the upper epidermis with pitted, somewhat polygonal cells; fragments of the lower epidermis with sinuous cells and numerous diacytic stomata (2.8.3); rare single glandular trichomes with a uni- or bicellular head and a stalk consisting of 1 to 4 cells; abundant glandular trichomes with a unicellular stalk and a head composed of 8 radiating cells with a raised common cuticle.

- C. Thin-layer chromatography (2.2.27).

Test solution. Shake 0.5 g of the freshly powdered drug (355) with 5 ml of *ethanol R* for 5 min.

Reference solution. Dissolve 20 µl of *thujone R* and 25 µl of *cineole R* in 20 ml of *ethanol R*.

Plate: *TLC silica gel plate R*.

Mobile phase: *ethyl acetate R*, *toluene R* (5:95 V/V).

Application: 20 µl, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray the plate with a 200 g/l solution of *phosphomolybdic acid R* in *ethanol R* and heat at 100-105 °C for 10 min. Examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones are present in the chromatogram obtained with the test solution.

Top of the plate	
_____	A blue zone (near the solvent front)
α-Thujone and β-thujone: 2 pinkish-violet zones	2 pinkish-violet zones (α-thujone and β-thujone)
Cineole: a blue zone	A blue zone (cineole)
_____	Blue zones
Reference solution	Test solution

TESTS

Foreign matter (2.8.2): maximum 3 per cent of stems and maximum 2 per cent of other foreign matter.

Water (2.2.13): maximum 100 ml/kg, determined on 20.0 g.

Total ash (2.4.16): maximum 10.0 per cent.

ASSAY

Carry out the determination of essential oils in vegetable drugs (2.8.12). Use 20.0 g of the substance to be examined, cut, if necessary, immediately before the assay, a 500 ml flask, 250 ml of *water R* as the distillation liquid and 0.5 ml of *xylene R* in the graduated tube. Distil at a rate of 2-3 ml/min for 2 h.

SAGE LEAF, THREE-LOBED

Salviae trilobae folium

DEFINITION

Three-lobed sage leaf consists of the whole or cut, dried leaves of *Salvia fruticosa* Mill. (*S. triloba* L. fil). The whole drug contains not less than 18 ml/kg of essential oil, and the cut drug not less than 12 ml/kg of essential oil, both calculated with reference to the anhydrous drug.

CHARACTERS

Three-lobed sage leaf has a spicy odour when ground, similar to eucalyptus oil.

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The lamina of the whole three-lobed sage leaf is about 8 mm to 50 mm long and about 4 mm to 20 mm wide, and oblong-ovate to lanceolate. The margin is finely crenate and undulate but indistinct owing to the dense hairy covering on both surfaces. The base is obtuse and sometimes bears one or two more or less developed lobes. The upper surface is grey-tomentose pubescent, the lower surface is densely white-tomentose pubescent; the venation is indistinct. The densely white-tomentose pubescent petiole is about 1 mm in diameter.
- B. Reduce to a powder (355). The powder is greyish-green and tomentose. Examine under a microscope using *chloral hydrate solution R*. The powder shows very numerous, whole and fragmented, covering and glandular trichomes, scattered and attached to fragments of the epidermises; covering trichomes articulated, uniseriate, thick-walled and bluntly tapering, those on the upper epidermis straight, those on the lower epidermis longer, tortuous and more densely packed; glandular trichomes, some with a unicellular or bicellular head and a stalk consisting of from one to four cells, the majority having a short, unicellular stalk and a head composed of eight radiating cells with a raised common cuticle; the upper epidermis with pitted and beaded cells, somewhat polygonal, with a few diacytic stomata (2.8.3); the lower epidermis with sinuous- to wavy-walled cells and numerous diacytic stomata.
- C. Examine the chromatogram obtained in the test for thujone. The chromatogram obtained with the test solution shows a blue zone corresponding to cineole, equal or greater in size and intensity to the zone in the chromatogram obtained with the reference solution. Further zones are present.

TESTS

Thujone. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution. Shake 0.3 g of the freshly powdered drug (355) with 5.0 ml of *ethanol R* for 5 min.

Reference solution. Dissolve 20 µl of *thujone R* and 25 µl of *cineole R* in 20 ml of *ethanol R*.

Apply to the plate as bands 20 µl of each solution. Develop over a path of 15 cm using a mixture of 5 volumes of *ethyl acetate R* and 95 volumes of *toluene R*. Allow the plate to dry in air. Spray with a 200 g/l solution of *phosphomolybdic acid R* in *ethanol R* and heat at 100 °C to 105 °C for 10 min. Examine in daylight. The chromatogram obtained with the reference solution shows in the middle part a blue zone

(cineole) and in the upper part a pink-blue zone (thujone). The chromatogram obtained with the test solution shows no zone or a very faint pink-blue zone corresponding to thujone.

Foreign matter (2.8.2). Not more than 8 per cent of stems and not more than 2 per cent of other foreign matter.

Water (2.2.13). Not more than 100 ml/kg, determined on 20.0 g by distillation.

Total ash (2.4.16). Not more than 10.0 per cent.

ASSAY

Carry out the determination of essential oils in vegetable drugs (2.8.12). Use 20.0 g of drug, if necessary cut immediately before the assay, a 500 ml flask, 250 ml of *water R* as the distillation liquid and 0.50 ml of *xylene R* in the graduated tube. Distil at a rate of 2 ml/min to 3 ml/min for 2 h.

STORAGE

Store protected from light.

01/2005:1889

SAGE TINCTURE

Salviae tinctura

DEFINITION

Tincture produced from *Sage leaf* (*Salvia officinalis*) (1370). *Content*: minimum 0.1 per cent *m/m* of essential oil.

PRODUCTION

The tincture is produced from 1 part of comminuted drug and 10 parts of ethanol (70 per cent *V/V*) by a suitable procedure.

CHARACTERS

Appearance: brownish liquid with a characteristic odour.

IDENTIFICATION

Thin-layer chromatography (2.2.27).

Test solution. The tincture to be examined.

Reference solution. Dissolve 20 µl of *thujone R* and 25 µl of *cineole R* in 20 ml of *ethanol R*.

Plate: TLC silica gel plate *R*.

Mobile phase: *ethyl acetate R*, *toluene R* (5:95 *V/V*).

Application: 20 µl, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with a 200 g/l solution of *phosphomolybdic acid R* in *ethanol R* and heat at 100-105 °C for 10 min.

Examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones are present in the chromatogram obtained with the test solution.

Top of the plate	
	A blue zone (near the solvent front)
_____	_____
α-Thujone and β-thujone: 2 pinkish-violet zones	2 pinkish-violet zones (α-thujone and β-thujone)
Cineole: a blue zone	A blue zone (cineole)
_____	_____
	Blue zones
Reference solution	Test solution

TESTS

Ethanol content (2.9.10): 64 per cent *V/V* to 69 per cent *V/V*.

Methanol and 2-propanol (2.9.11): maximum 0.05 per cent *V/V* of methanol and maximum 0.05 per cent of 2-propanol.

Dry residue (2.8.16): minimum 2.0 per cent *m/m*, determined on 3.00 g.

ASSAY

In a 500 ml round-bottomed flask, place 30.0 g of the tincture and add 100 ml of *water R*. Distil, using a descending condenser, into a separating funnel which has been marked beforehand at 50 ml. Stop the distillation process as soon as the distillate reaches the 50 ml mark. Rinse the condenser with 10 ml of *pentane R*. Dissolve in the distillate sufficient *sodium chloride R* to produce a saturated solution. Shake with 3 quantities, each of 20 ml, of *pentane R*. Dry the combined pentane layers, including the pentane from rinsing the condenser, over *anhydrous sodium sulphate R* and filter through a plug of absorbent cotton into a weighed 100 ml round-bottomed flask. Wash the sodium sulphate several times with small quantities of *pentane R*. Remove the pentane carefully at a temperature not exceeding 40 °C. Dry the residue in a desiccator over *diphosphorus pentoxide R* and hard paraffin at atmospheric pressure and at room temperature for 2 h. Weigh the residue (essential oil).

01/2005:0529

SALBUTAMOL

Salbutamolum

$C_{13}H_{21}NO_3$

M_r 239.3

DEFINITION

(1*R,S*)-2-[(1,1-Dimethylethyl)amino]-1-[4-hydroxy-3-(hydroxymethyl)phenyl]ethanol.

Content: 98.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: sparingly soluble in water, soluble in alcohol.

mp: about 155 °C, with decomposition.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

A. Dissolve 80.0 mg in a 10 g/l solution of *hydrochloric acid R* and dilute to 100.0 ml with the same acid. Dilute 10.0 ml of the solution to 100.0 ml with a 10 g/l solution of *hydrochloric acid R*. Examined between 230 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 276 nm. The specific absorbance at the maximum is 66 to 75.

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: *salbutamol CRS*.

C. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 50 ml with the same solvent.

Reference solution. Dissolve 10 mg of *salbutamol CRS* in *methanol R* and dilute to 50 ml with the same solvent.

Plate: *TLC silica gel plate R*.

Mobile phase: concentrated ammonia *R*, water *R*, ethyl acetate *R*, 2-propanol *R*, methyl isobutyl ketone *R* (3:18:35:45:50 V/V/V/V/V).

Application: 5 µl.

Development: over a path of 18 cm.

Drying: in air.

Detection: spray with a 1 g/l solution of methylbenzothiazolone hydrazone hydrochloride *R* in a 90 per cent V/V solution of *methanol R*, followed by a 20 g/l solution of potassium ferricyanide *R* in a mixture of 1 volume of concentrated ammonia *R1* and 3 volumes of water *R*, followed by a further spraying with a 1 g/l solution of methylbenzothiazolone hydrazone hydrochloride *R* in a 90 per cent V/V solution of *methanol R*.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

- D. Dissolve about 10 mg in 50 ml of a 20 g/l solution of disodium tetraborate *R*. Add 1 ml of a 30 g/l solution of aminopyrazolone *R*, 10 ml of methylene chloride *R* and 10 ml of a 20 g/l solution of potassium ferricyanide *R*. Shake and allow to separate. An orange-red colour develops in the methylene chloride layer.

TESTS

Solution S. Dissolve 0.50 g in *methanol R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₅ (2.2.2, Method II).

Optical rotation (2.2.7): -0.10° to $+0.10^{\circ}$ determined on solution S.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution. Dissolve 2.0 mg of *salbutamol CRS*, 2.0 mg of *salbutamol impurity B CRS*, 3.0 mg of *salbutamol impurity D CRS*, 3.0 mg of *salbutamol impurity F CRS*, 3.0 mg of *salbutamol impurity G CRS* and 3.0 mg of *salbutamol impurity I CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase. Dilute 2.0 ml of the solution to 100.0 ml with the mobile phase.

Column:

- size: $l = 0.15$ m, $\varnothing = 3.9$ mm,
- stationary phase: spherical end-capped octylsilyl silica gel for chromatography *R* (5 µm) with a specific surface of 335 m²/g, a pore size of 10 nm and a carbon loading of 11.7 per cent.

Mobile phase: mix 22 volumes of acetonitrile *R* and 78 volumes of a solution containing 2.87 g/l of sodium heptanesulphonate *R* and 2.5 g/l of potassium dihydrogen phosphate *R* adjusted to pH 3.65 with dilute phosphoric acid *R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 20 µl.

Run time: 25 times the retention time of salbutamol.

Relative retention with reference to salbutamol (retention time = about 1.9 min): impurity B = about 1.3, impurity A = about 1.7, impurity C = about 2.0, impurity D = about 2.7, impurity H = about 3.0, impurity E = about 3.1, impurity G = about 4.1, impurity F = about 6.2, impurity I = about 23.2.

System suitability: reference solution:

- resolution: minimum of 3.0 between the peaks due to salbutamol and to impurity B.

Limits:

- impurity D: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (0.3 per cent),
- impurity F: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (0.3 per cent),
- impurity G: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (0.3 per cent),
- impurity I: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (0.3 per cent),
- any other impurity: not more than 1.5 times the area of the peak due to salbutamol in the chromatogram obtained with reference solution (0.3 per cent),
- total: maximum 1.0 per cent,
- disregard limit: 0.05 per cent.

Impurity J: maximum 0.2 per cent.

Dissolve 50.0 mg in a 1 g/l solution of hydrochloric acid *R* and dilute to 25.0 ml with the same solvent. The absorbance (2.2.25) of the solution measured at 310 nm is not greater than 0.10.

Boron: maximum 50 ppm.

Test solution. To 50 mg of the substance to be examined add 5 ml of a solution containing 13 g/l of anhydrous sodium carbonate *R* and 17 g/l of potassium carbonate *R*. Evaporate to dryness on a water-bath and dry at 120 °C. Ignite the residue rapidly until the organic matter has been destroyed, allow to cool and add 0.5 ml of water *R* and 3.0 ml of a freshly prepared 1.25 g/l solution of curcumin *R* in glacial acetic acid *R*. Warm gently to effect solution, allow to cool and add 3.0 ml of a mixture prepared by adding 5 ml of sulphuric acid *R*, slowly and with stirring, to 5 ml of glacial acetic acid *R*. Mix and allow to stand for 30 min. Dilute to 100.0 ml with alcohol *R*, filter and use the filtrate.

Reference solution. Dissolve 0.572 g of boric acid *R* in 1000.0 ml of water *R*. Dilute 1.0 ml to 100.0 ml with water *R*. To 2.5 ml of the solution add 5 ml of a solution containing 13 g/l of anhydrous sodium carbonate *R* and 17 g/l of potassium carbonate *R*, and treat this mixture in the same manner as the test solution.

Measure the absorbance (2.2.25) of the test solution and of the reference solution at the maximum at about 555 nm. The absorbance of the test solution is not greater than that of the reference solution.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 30 ml of anhydrous acetic acid *R*. Titrate with 0.1 M perchloric acid, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M perchloric acid is equivalent to 23.93 mg of $C_{13}H_{21}NO_3$.

STORAGE

Protected from light.

IMPURITIES

- A. R1 = OCH_3 , R2 = CH_2OH : [5-[(1*RS*)-2-[(1,1-dimethylethyl)amino]-1-methoxyethyl]-2-hydroxyphenyl]methanol,

- J. R1+R2 = O, R3 = H: 2-[(1,1-dimethylethyl)amino]-1-[4-hydroxy-3-(hydroxymethyl)phenyl]ethanone (salbutamone),

- F. 1,1'-[oxybis[methylene(4-hydroxy-1,3-phenylene)]]bis[2-[(1,1-dimethylethyl)amino]ethanol],

- H. R1 = R2 = H: 4-[2-[(1,1-dimethylethyl)amino]ethyl]-2-methylphenol,
- I. R1 = OH, R2 = $CH_2-C_6H_5$: (1*RS*)-2-[(1,1-dimethylethyl)amino]-1-[3-(hydroxymethyl)-4-benzyloxyphenyl]ethanol.

SALBUTAMOL SULPHATE

Salbutamoli sulfas

$C_{26}H_{44}N_2O_{10}S$

M_r 576.7

DEFINITION

Bis[(1*RS*)-2-[(1,1-dimethylethyl)amino]-1-[4-hydroxy-3-(hydroxymethyl)phenyl]ethanol] sulphate.

Content: 98.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water, practically insoluble or very slightly soluble in alcohol and in methylene chloride.

IDENTIFICATION

First identification: B, E.

Second identification: A, C, D, E.

- A. Dissolve 80.0 mg in a 10 g/l solution of hydrochloric acid R and dilute to 100.0 ml with the same acid. Dilute 10.0 ml of the solution to 100.0 ml with a 10 g/l solution of hydrochloric acid R. Examined between 230 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 276 nm. The specific absorbance at the maximum is 55 to 64.

- B. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs of potassium bromide R.

Comparison: salbutamol sulphate CRS.

- C. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 12 mg of the substance to be examined in water R and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 12 mg of salbutamol sulphate CRS in water R and dilute to 10 ml with the same solvent.

Plate: TLC silica gel plate R.

Mobile phase: concentrated ammonia R, water R, ethyl acetate R, 2-propanol R, methyl isobutyl ketone R (3:18:35:45:50 V/V/V/V/V).

Application: 1 µl.

Development: over a path of 18 cm.

Drying: in air.

Detection: spray with a 1 g/l solution of methylbenzothiazolone hydrazone hydrochloride R in a 90 per cent V/V solution of methanol R, followed by a 20 g/l solution of potassium ferricyanide R in a mixture of 1 volume of concentrated ammonia R1 and 3 volumes of water R, followed by a further spraying with a 1 g/l solution of methylbenzothiazolone hydrazone hydrochloride R in a 90 per cent V/V solution of methanol R.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

D. Dissolve about 10 mg in 50 ml of a 20 g/l solution of *disodium tetraborate R*. Add 1 ml of a 30 g/l solution of *aminopyrazolone R*, 10 ml of *methylene chloride R* and 10 ml of a 20 g/l solution of *potassium ferricyanide R*. Shake and allow to separate. An orange-red colour develops in the methylene chloride layer.

E. It gives reaction (a) of sulphates (2.3.1).

TESTS

Solution S. Dissolve 0.250 g in *carbon dioxide-free water R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, Method II).

Optical rotation (2.2.7): -0.10° to $+0.10^{\circ}$, determined on solution S.

Acidity or alkalinity. To 10 ml of solution S add 0.15 ml of *methyl red solution R* and 0.2 ml of 0.01 M *sodium hydroxide*. The solution is yellow. Not more than 0.4 ml of 0.01 M *hydrochloric acid* is required to change the colour of the indicator to red.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution. Dissolve 2.4 mg of *salbutamol sulphate CRS*, 2.0 mg of *salbutamol impurity B CRS*, 3.0 mg of *salbutamol impurity D CRS*, 3.0 mg of *salbutamol impurity F CRS*, 3.0 mg of *salbutamol impurity G CRS* and 3.0 mg of *salbutamol impurity I CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase. Dilute 2.0 ml of the solution to 100.0 ml with the mobile phase.

Column:

- **size:** $l = 0.15$ m, $\varnothing = 3.9$ mm,
- **stationary phase:** spherical *end-capped octylsilyl silica gel for chromatography R* (5 μ m) with a specific surface area of 335 m²/g, a pore size of 10 nm and a carbon loading of 11.7 per cent.

Mobile phase: mix 22 volumes of *acetonitrile R* and 78 volumes of a solution containing 2.87 g/l of *sodium heptanesulphonate R* and 2.5 g/l of *potassium dihydrogen phosphate R* adjusted to pH 3.65 with *dilute phosphoric acid R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 20 μ l.

Run time: 25 times the retention time of salbutamol.

Relative retention with reference to salbutamol (retention time = about 1.9 min): impurity B = about 1.3, impurity A = about 1.7, impurity C = about 2.0, impurity D = about 2.7, impurity H = about 3.0, impurity E = about 3.1, impurity G = about 4.1, impurity F = about 6.2, impurity I = about 23.2.

System suitability: reference solution:

- **resolution:** minimum of 3.0 between the peaks due to salbutamol and to impurity B.

Limits:

- **impurity D:** not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.3 per cent),
- **impurity F:** not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.3 per cent),
- **impurity G:** not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.3 per cent),
- **impurity I:** not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.3 per cent),
- **any other impurity:** not more than 1.5 times the area of the peak due to salbutamol in the chromatogram obtained with the reference solution (0.3 per cent),
- **total:** maximum 1.0 per cent,
- **disregard limit:** 0.05 per cent.

Impurity J: maximum 0.2 per cent.

Dissolve 60.0 mg in a 1 g/l solution of *hydrochloric acid R* and dilute to 25.0 ml with the same solvent. The absorbance (2.2.25) of the solution measured at 310 nm is not greater than 0.10.

Boron: maximum 50 ppm.

Test solution. To 50 mg of the substance to be examined add 5 ml of a solution containing 13 g/l of *anhydrous sodium carbonate R* and 17 g/l of *potassium carbonate R*. Evaporate to dryness on a water-bath and dry at 120 °C. Ignite the residue rapidly until the organic matter has been destroyed, allow to cool and add 0.5 ml of *water R* and 3.0 ml of a freshly prepared 1.25 g/l solution of *curcumin R* in *glacial acetic acid R*. Warm gently to effect solution, allow to cool and add 3.0 ml of a mixture prepared by adding 5 ml of *sulphuric acid R*, slowly and with stirring, to 5 ml of *glacial acetic acid R*. Mix and allow to stand for 30 min. Dilute to 100.0 ml with *alcohol R*, filter and use the filtrate.

Reference solution. Dissolve 0.572 g of *boric acid R* in 1000.0 ml of *water R*. Dilute 1.0 ml to 100.0 ml with *water R*. To 2.5 ml of the solution add 5 ml of a solution containing 13 g/l of *anhydrous sodium carbonate R* and 17 g/l of *potassium carbonate R*, and treat this mixture in the same manner as the test solution.

Measure the absorbance (2.2.25) of the test solution and of the reference solution at the maximum at about 555 nm. The absorbance of the test solution is not greater than that of the reference solution.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.400 g in 5 ml of *anhydrous formic acid R* and add 35 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 57.67 mg of C₂₆H₄₄N₂O₁₀S.

STORAGE

Protected from light.

- H. R1 = R2 = H: 4-[2-[(1,1-dimethylethyl)amino]ethyl]-2-methylphenol,
- I. R1 = OH, R2 = CH₂-C₆H₅: (1RS)-2-[(1,1-dimethylethyl)amino]-1-[3-(hydroxymethyl)-4-benzyloxyphenyl]ethanol.

SALICYLIC ACID

Acidum salicylicum

C₇H₆O₃M_r 138.1

DEFINITION

Salicylic acid contains not less than 99.0 per cent and not more than the equivalent of 100.5 per cent of 2-hydroxybenzenecarboxylic acid, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder or white or colourless, acicular crystals, slightly soluble in water, freely soluble in alcohol, sparingly soluble in methylene chloride.

IDENTIFICATION

First identification: A, B.

Second identification: A, C.

- A. Melting point (2.2.14): 158 °C to 161 °C.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *salicylic acid CRS*.
- C. Dissolve about 30 mg in 5 ml of 0.05 M sodium hydroxide, neutralise if necessary and dilute to 20 ml with *water R*. 1 ml of the solution gives reaction (a) of salicylates (2.3.1).

TESTS

Solution S. Dissolve 2.5 g in 50 ml of boiling *distilled water R*, cool and filter.

Appearance of solution. Dissolve 1 g in 10 ml of *alcohol R*. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.50 g of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 10 mg of *phenol R* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 25 mg of 4-hydroxyisophthalic acid *R* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (c). Dissolve 50 mg of 4-hydroxybenzoic acid *R* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (d). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the mobile phase.

Reference solution (e). Dilute a mixture of 1.0 ml of each of reference solutions (a), (b) and (c) to 10.0 ml with the mobile phase.

Reference solution (f). Dilute a mixture of 0.1 ml of each of reference solutions (a), (b) and (c) to 10.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 4.6 mm in internal diameter packed with non-deactivated octadecylsilyl silica gel for chromatography *R* (5 µm),

- as mobile phase at a flow rate of 0.5 ml/min a mixture of 1 volume of *glacial acetic acid R*, 40 volumes of *methanol R* and 60 volumes of *water R*,
- as detector a spectrophotometer set at 270 nm.

Inject 10 µl of reference solutions (d) and (e). When the chromatograms are recorded in the prescribed conditions, the retention times relative to phenol are: 4-hydroxybenzoic acid about 0.70 and 4-hydroxyisophthalic acid about 0.90. Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with reference solution (f) is at least 70 per cent of the full scale of the recorder. The test is not valid unless: in the chromatogram obtained with reference solution (e), the third peak corresponds to the phenol peak in the chromatogram obtained with reference solution (d) and the resolution between the peaks corresponding to 4-hydroxyisophthalic acid and to phenol is at least 1.0. If this resolution is not obtained adjust the quantity of acetic acid in the mobile phase.

Inject 10 µl of the test solution and 10 µl of reference solution (f). In the chromatogram obtained with the test solution: the areas of the peaks due to 4-hydroxybenzoic acid, 4-hydroxyisophthalic acid and phenol are not greater than the areas of the corresponding peaks in the chromatogram obtained with reference solution (f) (0.1 per cent for 4-hydroxybenzoic acid; 0.05 per cent for 4-hydroxyisophthalic acid and 0.02 per cent for phenol).

In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak and the peaks due to 4-hydroxybenzoic acid, 4-hydroxyisophthalic acid and phenol, is not greater than that of the peak due to 4-hydroxyisophthalic acid in the chromatogram obtained with reference solution (f) (0.05 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than twice the area of the peak due to 4-hydroxybenzoic acid in the chromatogram obtained with reference solution (f) (0.2 per cent). Disregard any peak with an area less than 0.01 times that of the principal peak in the chromatogram obtained with reference solution (f).

Chlorides (2.4.4). 10 ml of solution S diluted to 15 ml with *water R* complies with the limit test for chlorides (100 ppm).

Sulphates. Not more than 200 ppm. Dissolve 1.0 g in 5 ml of *dimethylformamide R* and add 4 ml of *water R*. Mix thoroughly. Add 0.2 ml of *dilute hydrochloric acid R* and 0.5 ml of a 25 per cent *m/m* solution of *barium chloride R*. After 15 min any opalescence in the solution is not more intense than that in a standard prepared as follows: to 2 ml of *sulphate standard solution (100 ppm SO₄) R* add 0.2 ml of *dilute hydrochloric acid R*, 0.5 ml of a 25 per cent *m/m* solution of *barium chloride R*, 3 ml of *water R* and 5 ml of *dimethylformamide R*.

Heavy metals (2.4.8). Dissolve 2.0 g in 15 ml of *alcohol R* and add 5 ml of *water R*. 12 ml of the solution complies with limit test B for heavy metals (20 ppm). Prepare the standard using lead standard solution (2 ppm Pb) prepared by diluting *lead standard solution (100 ppm Pb) R* with a mixture of 5 volumes of *water R* and 15 volumes of *alcohol R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in a desiccator.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 2.0 g.

ASSAY

Dissolve 0.120 g in 30 ml of *alcohol R* and add 20 ml of *water R*. Titrate with 0.1 M *sodium hydroxide*, using 0.1 ml of *phenol red solution R* as indicator.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 13.81 mg of C₇H₆O₃.

STORAGE

Store protected from light.

IMPURITIES

- A. R = H: 4-hydroxybenzoic acid,
- B. R = CO₂H: 4-hydroxyisophthalic acid,
- C. phenol.

01/2005:1910

SALMON OIL, FARMED

Salmonis domestici oleum

DEFINITION

Purified fatty oil obtained from fresh farmed *Salmo salar*. The positional distribution (β(2)-acyl) is 60-70 per cent for cervonic (docosahexaenoic) acid (C22:6 n-3; DHA), 25-35 per cent for timnodonic (eicosapentaenoic) acid (C20:5 n-3; EPA) and 40-55 per cent for moroctic acid (C18:4 n-3).

Content:

- sum of the contents of EPA and DHA (expressed as triglycerides): 10.0 per cent to 28.0 per cent.

Authorised antioxidants in concentrations not exceeding the levels specified by the competent authority may be added.

PRODUCTION

The fish shall only be given feed with a composition that is in accordance with the relevant EU or other applicable regulations.

The oil is produced by mechanical expression of fresh raw materials, either from the whole fish, or fish where the fillets have been removed, at a temperature not exceeding 100 °C, and without using solvents. After centrifugation, solid substances may be removed from the oil by cooling and filtering (winterisation).

CHARACTERS

Appearance: pale pink liquid.

Solubility: practically insoluble in water, very soluble in acetone and in heptane, slightly soluble in anhydrous ethanol.

IDENTIFICATION

Examine the ¹³C NMR spectra obtained in the assay for positional distribution (β(2)-acyl) of fatty acids. The spectra contain peaks between 172 ppm and 173 ppm with shifts similar to those in the type spectrum (Figure 1910-2). The oil to be examined complies with the limits of this assay.

TESTS

Absorbance (2.2.25): minimum 0.10, measured at the maximum between 470 nm and 480 nm.

Dissolve 5.0 ml in 5.0 ml of *trimethylpentane R*.

Acid value (2.5.1): maximum 2.0.

Anisidine value (2.5.36): maximum 10.0.

Peroxide value (2.5.5, Method A): maximum 5.0.

Unsaponifiable matter (2.5.7): maximum 1.5 per cent, determined on 5.0 g.

Linoleic acid (2.4.29): maximum 11.0 per cent.

Identify the peak due to linoleic acid using the chromatogram in Figure 1910.-1. Determine the percentage content by normalisation.

ASSAY

Positional distribution (β (2)-acyl) of fatty acids (2.2.33)

Use a high resolution FT-NMR spectrometer operating at minimum 300 MHz.

Test solution. Dissolve 190-210 mg of fresh salmon oil in 500 μ l of deuterated chloroform *R*. Prepare at least 3 samples and examine within 3 days.

Acquisition of ^{13}C NMR spectra. The following parameters may be used.

- *sweep width*: 200 ppm (–5 to 195 ppm),
- *irradiation frequency offset*: 95 ppm,

- *time domain*: 64 K,
- *pulse delay*: 2 s,
- *pulse program*: zgig 30 (inverse gated, 30° excitation pulse),
- *dummy scans*: 4,
- *number of scans*: 4096.

Processing and plotting. The following parameters may be used:

- *size*: 64 K (zero-filling),
- *window multiplication*: exponential,
- *Lorentzian broadening factor*: 0.2 Hz.

Use the CDCl_3 signal for shift referencing. The shift of the central peak of the 1:1:1 triplet is set to 77.16 ppm.

Plot the spectral region δ 171.5-173.5 ppm. Compare the spectrum with the reference spectrum in Figure 1910.-2. The shift values lie within the ranges given in Table 1910.-1.

1. C14:0	6. C18:1 n-9	11. C20:1 n-9	16. C21:5 n-3
2. C16:0	7. C18:1 n-7	12. C20:4 n-6	17. C22:5 n-6
3. C16:1 n-7	8. C18:2 n-6	13. C20:4 n-3	18. C22:5 n-3
4. C16:4 n-1	9. C18:3 n-3	14. EPA	19. DHA
5. C18:0	10. C18:4 n-3	15. C22:1 n-11	

Figure 1910.-1. – Chromatogram for the composition of fatty acids in farmed salmon oil

Figure 1910.-2. – ^{13}C NMR spectrum carbonyl region of farmed salmon oil

Table 1910.-1 – Shift values

Signal	Shift range (ppm)
β DHA	172.05 - 172.09
α DHA	172.43 - 172.47
β EPA	172.52 - 172.56
α EPA	172.90 - 172.94
β C18:4	172.56 - 172.60
α C18:4	172.95 - 172.99

System suitability: calculate the signal-to-noise ratio for the smallest relevant peak corresponding to α C18:4 signal (in the range δ 172.95-172.99 ppm). Measure the peak width at half-height for the central CDCl_3 signal (at δ 77.16 ppm). The system suitability criteria in Table 1910.-2 are fulfilled.

Table 1910.-2 – System suitability criteria

S/N smallest peak	Peak width (ppm)
minimum 5	maximum 0.02

Calculation of positional distribution: calculate the positional distribution ($\beta(2)$ -acyl) using the expression:

$$\frac{\beta}{\alpha + \beta} \times 100$$

- α = peak area of the corresponding α -carbonyl peak,
 β = peak area of β -carbonyl peak from C22:6 n-3, C20:5 n-3 or C18:4 n-3, respectively.

Limits:

	Positional distribution (mole %)		
	β DHA	β EPA	β C18:4
Limits	60 - 70	25 - 35	40 - 55

EPA and DHA (2.4.29). See Figure 1910.-1.

STORAGE

In an airtight, well-filled container, protected from light, under inert gas.

LABELLING

The label states the name and concentration of any added antioxidant.

01/2005:1848

SAW PALMETTO FRUIT

Sabal serrulatae fructus

DEFINITION

Dried ripe fruit of *Serenoa repens* (Bartram) Small. (*Sabal serrulata* (Michaux) Nichols).

Content: minimum 11.0 per cent of total fatty acids (dried drug).

CHARACTERS

Characteristic, strong, unpleasant but not rancid odour.

Macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

First identification: A, B, D.

Second identification: A, B, C.

- A. The fruit is an ovoid to subspherical drupe, with a dark brown to blackish, roughly wrinkled surface and more or less coppery sheen, up to 2.5 cm long and 1.5 cm in diameter. The apex sometimes bears the remains of the style and tubular calyx, with 3 teeth, and the base bears a small depression with the scar of the stalk. The epicarp and underlying mesocarp form a thin fragile layer, which partially peels off, revealing the thin, hard, pale brown endocarp, which is fibrous and easily separable. The

seed is irregularly spherical to ovoid, up to 12 mm long and 8 mm in diameter, with a hard, smooth or finely pitted surface which is reddish-brown with a paler, raised and membranous area over the raphe and micropyle; cut transversely, the seed has a thin testa, narrow perisperm and a large area of dense, horny, greyish-white endosperm, with the embryo positioned to one side.

- B. Reduce to a powder (710). The powder is reddish or blackish-brown and oily. Examine under a microscope using *chloral hydrate solution R*. The powder shows fragments of epicarp composed of several layers of thin-walled, reddish-brown, pigmented, polyhedral cells (10 µm to 40 µm) which are strongly cuticularised; those of the outer layers are much smaller than those of the inner layers. Parenchyma cells of the mesocarp may be large and filled with oil droplets, or smaller and containing nodules of silica. Groups of xylem tissue of the mesocarp show small lignified, annular or spirally thickened vessels. Stone cells of the mesocarp (20 µm to 200 µm) may be found scattered, usually singly but sometimes in small groups, the walls are moderately thickened, distinctly striated and finely pitted. Fragments of endocarp contain groups of elongated sclereids about 300 µm long, with strongly thickened walls and numerous pits. The seed testa consists of small, thin-walled cells with brownish contents and underlying sclereids; albumen cells are thick-walled with large conspicuous pits and contain aleurone grains and fixed oil.

C. Thin-layer chromatography (2.2.27).

Test solution. To 1.5 g of the powdered drug (710), add 20 ml of *alcohol R* and stir for 15 min. Filter.

Reference solution. Dissolve 4 mg of *β-amyryn R* and 10 mg of *β-sitosterol R* in 10 ml of *alcohol R*.

Plate: TLC silica gel plate *R* (2-10 µm).

Mobile phase: *acetic acid R*, *ethyl acetate R*, *toluene R* (1:30:70 V/V/V).

Application: 8 µl of the test solution and 2 µl of the reference solution, as bands.

Development: over a path of 10 cm.

Drying: in air.

Detection: spray with *anisaldehyde solution R*; dry the plate at 100-105 °C for 5-10 min; examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other faint zones are present, especially in the lower third, in the chromatogram obtained with the test solution.

Top of the plate	
	A strong blue zone
	A faint blue zone
	A faint blue zone
	A strong bluish-violet zone
	A faint blue zone
β-Amyryn: a blue zone	
β-Sitosterol: a blue zone	
	A faint blue zone
Reference solution	Test solution

- D. Examine the chromatograms obtained in the assay of total fatty acids.

Results: the characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to the characteristic peaks in the chromatogram obtained with the reference solution. The principal peak is due to lauric acid.

TESTS

Foreign matter (2.8.2): maximum 2.0 per cent.

Loss on drying (2.2.32): maximum 12.0 per cent, determined on 1.000 g of the powdered drug (710) by drying in an oven at 100-105 °C for 2 h.

Total ash (2.4.16): maximum 5.0 per cent.

ASSAY

Total fatty acids. Gas chromatography (2.2.28).

Internal standard solution. Dissolve 0.47 g of *methyl pelargonate R* and 0.47 g of *methyl margarate R* in 20.0 ml of *dimethylformamide R* and dilute to 100.0 ml with the same solvent.

Test solution. Reduce 50 g of the drug to a powder (200). Place 4.0 g of the powdered drug in a 100 ml volumetric flask. Add 60.0 ml of *dimethylformamide R*. Mix using sonication for 15 min and then shake for 30 min. Dilute to 100.0 ml with *dimethylformamide R*. Allow to stand for a few minutes and filter. To 20.0 ml of this solution add 4.0 ml of the internal standard solution and dilute to 25.0 ml with *dimethylformamide R*. To 0.4 ml of this solution add 0.6 ml of an 18.84 g/l solution of *trimethylsulphonium hydroxide R* in *methanol R* and mix.

Reference solution. Dissolve 32.0 mg of *caproic acid R*, 62.0 mg of *caprylic acid R*, 68.0 mg of *capric acid R*, 0.699 g of *lauric acid R*, 0.267 g of *myristic acid R*, 10.0 mg of *palmitoleic acid R*, 0.217 g of *palmitic acid R*, 0.115 g of *linoleic acid R*, 18.0 mg of *linolenic acid R*, 0.870 g of *oleic acid R* and 49.0 mg of *stearic acid R* in *dimethylformamide R* and dilute to 10.0 ml with the same solvent. To 1.0 ml of the solution add 4.0 ml of the internal standard solution and dilute to 25.0 ml with *dimethylformamide R*. To 0.4 ml of this solution add 0.6 ml of an 18.84 g/l solution of *trimethylsulphonium hydroxide R* in *methanol R* and mix.

Column:

- **material:** fused silica,
- **size:** *l* = 25 m (a film thickness of 1 µm may be used) to 60 m (a film thickness of 0.2 µm may be used), Ø = 0.20-0.53 mm,
- **stationary phase:** *poly(dimethyl)siloxane R*.

Carrier gas: *helium for chromatography R*.

Flow rate: 0.5 ml/min.

Split ratio: 1:40.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 2	150
	2 - 7	150 → 190
	7 - 22	190 → 220
Injection port		300
Detector		300

Detection: flame ionisation.

Injection: 1.0 µl.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution on the chromatogram obtained with the test solution.

Use the expression below to determine the percentage content of the different fatty acids. Determine the content of caproic acid, caprylic acid, capric acid and lauric acid using methyl pelargonate as the internal standard. Determine the content of myristic acid, palmitoleic acid, palmitic acid, linoleic acid, linolenic acid, oleic acid and stearic acid using methyl margarate as the internal standard. The peak area of lauric acid is not less than 20 per cent of the total area of the peaks.

$$\frac{A_1}{A_3} \times \frac{A_2}{A_4} \times \frac{m_2}{m_1} \times p \times 0.5$$

- A_1 = area of the peak due to the considered derivatised fatty acid in the chromatogram obtained with the test solution,
- A_2 = area of the peak due to methyl pelargonate or methyl margarate in the chromatogram obtained with the reference solution,
- A_3 = area of the peak due to methyl pelargonate or methyl margarate in the chromatogram obtained with the test solution,
- A_4 = area of the peak due to the considered derivatised fatty acid in the chromatogram obtained with the reference solution,
- m_1 = mass of the test sample, in grams,
- m_2 = mass of the considered fatty acid in the reference solution, in grams,
- p = percentage purity of the considered fatty acid in the reference solution.

01/2005:1260

SELEGILINE HYDROCHLORIDE

Selegilini hydrochloridum

 $C_{13}H_{18}ClN$ M_r 223.7

DEFINITION

Selegiline hydrochloride contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of *N*-methyl-*N*[(1*R*)-1-methyl-2-phenylethyl]prop-2-yn-1-amine hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, freely soluble in water and in methanol, slightly soluble in acetone.

It melts at about 143 °C.

IDENTIFICATION

- A. Dissolve 2.000 g in *carbon dioxide-free water R* and dilute to 20.0 ml with the same solvent. The specific optical rotation (2.2.7) is -10.0 to -12.0 , calculated with reference to the dried substance.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *selegiline hydrochloride CRS*. Examine the substances as discs prepared using *potassium chloride R*.

C. It gives reaction (a) of chlorides (2.3.1).

TESTS

pH (2.2.3). Dissolve 0.20 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent. The pH of the solution is 3.5 to 4.5.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 20 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 50.0 mg of *selegiline hydrochloride CRS* and 10.0 mg of *butyl parahydroxybenzoate R* in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 1.0 ml to 20.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 1.0 ml to 50.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture prepared as follows: dilute 500 ml of *acetonitrile R* to 1000.0 ml with a butylammonium acetate buffer solution pH 6.5 prepared by dissolving 4 ml of *butylamine R* in 900 ml of *water R* and adjusting to pH 6.5 with *acetic acid R* before diluting to 1000.0 ml with *water R*,
- as detector a spectrophotometer set at 215 nm.

Inject 20 µl of reference solution (a). The test is not valid unless, in the chromatogram obtained with reference solution (a), the resolution between the peaks corresponding to selegiline and butyl parahydroxybenzoate is greater than three. Inject 20 µl of the test solution and 20 µl of reference solution (b). Continue the chromatography for 1.7 times the retention time of selegiline. In the chromatogram obtained with the test solution: the area of any peak apart from the principal peak is not greater than that of the peak in the chromatogram obtained with reference solution (b) (0.2 per cent); and the sum of the areas of such peaks is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Disregard any peak due to chlorides and any peak with an area less than 0.1 times that of the principal peak in the chromatogram obtained with reference solution (b) (0.02 per cent).

(S)-Selegiline. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 20.0 mg of the substance to be examined in a mixture of 1 ml of *2-propanol R* and 10 µl of *butylamine R* and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 8.0 mg of *(RS)*-selegiline hydrochloride CRS in a mixture of 10 µl of *butylamine R* and 1 ml of *2-propanol R* and dilute to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 0.5 ml of reference solution (a) to 20.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *silica gel OD for chiral separation R*,
- as the mobile phase at a flow rate of 1 ml/min a mixture of 0.2 volumes of *2-propanol R* and 99.8 volumes of *cyclohexane R*,
- as detector a spectrophotometer set at 220 nm.

Inject 20 µl of each solution. When the chromatograms are recorded in the prescribed conditions, the retention time of (S)-selegiline is about 10 min. Adjust the sensitivity of the system so that the height of the peaks in the chromatogram obtained with reference solution (b) is about 10 per cent of the full scale of the recorder. The test is not valid unless in the chromatogram obtained with reference solution (a) the resolution between the peaks corresponding to (S)-selegiline and (R)-selegiline is at least 1.5. If necessary, adjust the concentration of 2-propanol in the mobile phase. In the chromatogram obtained with the test solution, any peak due to (S)-selegiline is not greater than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.5 per cent).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying at 60 °C at a pressure not exceeding 0.5 kPa.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.180 g in 50 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 22.37 mg of C₁₃H₁₈ClN.

STORAGE

Store protected from light.

IMPURITIES

- A. (2*RS*)-*N*-methyl-1-phenylpropan-2-amine [(*RS*)-metamphetamine],
- B. (2*R*)-1-phenylpropan-2-amine (amphetamine),
- C. (1*RS*,2*SR*)-2-amino-1-phenylpropan-1-ol (phenylpropanolamine),

- D. R₁ = R₃ = H, R₂ = CH₃: *N*-[(1*R*)-1-methyl-2-phenylethyl]prop-2-yn-1-amine (demethylselegiline),
- E. R₁ = R₃ = CH₃, R₂ = H: *N*-methyl-*N*-[(1*S*)-1-methyl-2-phenylethyl]prop-2-yn-1-amine [(*S*)-selegiline].

01/2005:1147

SELENIUM DISULPHIDE

Selenii disulfidum

SeS₂

*M*_r 143.1

DEFINITION

Selenium disulphide contains not less than 52.0 per cent and not more than 55.5 per cent of Se.

CHARACTERS

A bright-orange or reddish-brown powder, practically insoluble in water.

IDENTIFICATION

- A. Gently boil about 50 mg with 5 ml of *nitric acid R* for 30 min. Dilute to 50 ml with *water R* and filter. To 5 ml of the filtrate add 10 ml of *water R* and 5 g of *urea R*. Heat to boiling, cool and add 1.5 ml of *potassium iodide solution R*. A yellow to orange colour is produced which darkens rapidly on standing. This solution is used in identification test B.
- B. Allow the coloured solution obtained under identification A to stand for 10 min and filter through *kieselguhr for chromatography R*. 5 ml of the filtrate give reaction (a) of sulphates (2.3.1).

TESTS

Soluble selenium compounds. To 10 g add 100 ml of *water R*, mix well, allow to stand for 1 h with frequent shaking and filter. To 10 ml of the filtrate add 2 ml of a 115 g/l solution of *anhydrous formic acid R*, dilute to 50 ml with *water R* and adjust to pH 2.0 to 3.0 with an 115 g/l solution of *anhydrous formic acid R*. Add 2 ml of a 5 g/l solution of 3,3'-*diaminobenzidine tetrahydrochloride R*. Allow to stand for 45 min and then adjust to pH 6.0 to 7.0 with *dilute ammonia R1*. Shake the solution for 1 min with 10 ml of *toluene R* and allow the phases to separate. The absorbance (2.2.25) of the upper layer measured at 420 nm is not greater than that of a standard prepared at the same time and in the same manner beginning at the words "add 2 ml of an 115 g/l solution of *anhydrous formic acid R*" and using 5 ml of *selenium standard solution (1 ppm Se) R* (5 ppm, calculated as Se).

ASSAY

To 0.100 g add 25 ml of *fuming nitric acid R* and heat on a water-bath for 1 h; a small insoluble residue may remain. Cool and dilute to 100.0 ml with *water R*. To 25.0 ml add 50 ml of *water R* and 5 g of *urea R* and heat to boiling. Cool, add 7 ml of *potassium iodide solution R*, 3 ml of *starch solution R* and titrate immediately with 0.1 M *sodium thiosulphate*. Carry out a blank titration.

1 ml of 0.1 M *sodium thiosulphate* is equivalent to 1.974 mg of Se.

01/2005:0202

SENEGA ROOT

Polygalae radix

DEFINITION

Senega root consists of the dried and usually fragmented root and root crown of *Polygala senega* L. or of certain other closely related species or of a mixture of these *Polygala* species.

CHARACTERS

Senega root has a faint, sweet odour, slightly rancid or reminiscent of methyl salicylate.

Reduced to a powder, it is irritant and sternutatory. Shaken with water, the powder produces a copious froth.

It has the macroscopic and microscopic characters described under identification tests A, B and C.

IDENTIFICATION

- A. The root crown is greyish-brown and wider than the root; it forms an irregular head consisting of numerous remains of stems and tightly packed purplish-brown buds. The taproot is brown to yellow, occasionally branched, sometimes flexuous, usually tortuous without secondary

roots, except in the Japanese varieties and species, which contain numerous fibrous rootlets. The diameter is usually 1 mm to 8 mm at the crown, gradually tapering to the tip; the surface is transversely and longitudinally striated and often shows a more or less distinct decurrent, elongated spiral keel. The fracture is short and shows a yellowish cortex of varying thickness surrounding a paler central woody area somewhat circular or irregular in shape depending on the species.

- B. Examine under a microscope using *chloral hydrate solution R*. The transverse section of the root shows cork formed from several layers of thin-walled cells, phelloderm of slightly collenchymatous cells containing droplets of oil; the phloem and xylem arrangement is usually normal, especially near the crown but where a keel is present this is formed by increased development of phloem; other anomalous secondary development sometimes occurs, resulting in the formation of one or two large wedge-shaped rays in the phloem and xylem, the parenchymatous cells of which contain droplets of oil. The xylem is usually central and consists of vessels up to 60 µm in diameter associated with numerous thin-walled tracheids and a few small lignified parenchymatous cells.
- C. Reduce to a powder (355). The powder is light brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: longitudinal fragments of lignified tissue made up of pitted tracheids and somewhat larger vessels with numerous bordered pits or with reticulate thickening; yellowish parenchyma and collenchymatous cells containing droplets of oil; occasional fragments of cork, and of epidermal tissue with stomata and unicellular trichomes from the bud scales. Crystals and stone cells are absent.
- D. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. To 1.0 g of the powdered drug (355) add 10 ml of *alcohol (70 per cent V/V) R*, boil under a reflux condenser for 15 min, filter and allow to cool.

Reference solution. Dissolve 10 mg of *aescin R* in *alcohol (70 per cent V/V) R* and dilute to 10 ml with the same solvent.

Apply to the plate as bands 20 mm by 3 mm 10 µl of the test solution and 10 µl and 40 µl of the reference solution. Develop over a path of 12 cm using the upper layer of a mixture of 10 volumes of *glacial acetic acid R*, 40 volumes of *water R* and 50 volumes of *butanol R*. Dry the plate at 100-105 °C, spray with about 10 ml of *anisaldehyde solution R* for a plate 200 mm square and heat again at 100-105 °C, observing the chromatogram obtained with the test solution until red zones (corresponding to saponosides) appear. In the chromatogram obtained with the test solution, three to five red zones appear in the lower and middle parts, similar in position to the grey-violet zones corresponding to aescin in the chromatogram obtained with the reference solution. Spray the plate with about 10 ml of a 200 g/l solution of *phosphomolybdic acid R* in *ethanol R* and heat at 100-105 °C, observing the chromatograms, until the zones corresponding to saponosides become blue. The intensity and size of the zones in the chromatogram obtained with the test solution are between those of the two bands corresponding to aescin in the chromatograms obtained respectively with 10 µl and 40 µl of the reference solution.

TESTS

Foreign matter (2.8.2). It complies with the test for foreign matter.

Total ash (2.4.16). Not more than 6.0 per cent.

Ash insoluble in hydrochloric acid (2.8.1). Not more than 3.0 per cent.

STORAGE

Store protected from light and humidity.

01/2005:0206

SENNA LEAF

Sennae folium

DEFINITION

Senna leaf consists of the dried leaflets of *Cassia senna* L. (*C. acutifolia* Delile), known as Alexandrian or Khartoum senna, or *Cassia angustifolia* Vahl, known as Tinnevely senna, or a mixture of the two species. It contains not less than 2.5 per cent of hydroxyanthracene glycosides, calculated as sennoside B ($C_{42}H_{38}O_{20}$; M_r 863) with reference to the dried drug.

CHARACTERS

Senna leaf has a slight characteristic odour.

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. *C. senna* occurs as greyish-green to brownish-green, thin, fragile leaflets, lanceolate, mucronate, asymmetrical at the base, usually 15 mm to 40 mm long and 5 mm to 15 mm wide, the maximum width being at a point slightly below the centre; the lamina is slightly undulant with both surfaces covered with fine, short trichomes. Pinnate venation is visible mainly on the lower surface, with lateral veins leaving the midrib at an angle of about 60° and anastomosing to form a ridge near the margin. **Stomatal index (2.8.3):** 10-12.5-15.

C. angustifolia occurs as yellowish-green to brownish-green leaflets, elongated and lanceolate, slightly asymmetrical at the base, usually 20 mm to 50 mm long and 7 mm to 20 mm wide at the centre. Both surfaces are smooth with a very small number of short trichomes and are frequently marked with transverse or oblique lines. **Stomatal index (2.8.3):** 14-17.5-20

- B. Reduce to a powder (355). The powder is light green to greenish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: polygonal epidermal cells showing paracytic stomata (2.8.3); unicellular trichomes, conical in shape, with warted walls, isolated or attached to fragments of epidermis; fragments of vascular bundles with a crystal sheath of prismatic crystals of calcium oxalate; cluster crystals isolated or in fragments of parenchyma.
- C. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.
- Test solution.** To 0.5 g of the powdered drug (180) add 5 ml of a mixture of equal volumes of *alcohol R* and *water R* and heat to boiling. Centrifuge and use the supernatant liquid.
- Reference solution.** Dissolve 10 mg of *senna extract CRS* in 1 ml of a mixture of equal volumes of *alcohol R* and *water R* (a slight residue remains).

Apply to the plate as bands 20 mm by 2 mm 10 µl of each solution. Develop over a path of 10 cm using a mixture of 1 volume of *glacial acetic acid R*, 30 volumes of *water R*, 40 volumes of *ethyl acetate R* and 40 volumes of *propanol R*. Allow the plate to dry in air, spray with a 20 per cent V/V solution of *nitric acid R* and heat at 120 °C for 10 min. Allow to cool and spray with a 50 g/l solution of *potassium hydroxide R* in *alcohol (50 per cent V/V) R* until the zones appear. The principal zones in the chromatogram obtained with the test solution are similar in position (sennosides B, A, D and C in the order of increasing R_f value), colour and size to the principal zones in the chromatogram obtained with the reference solution. Between the zones corresponding to sennosides D and C a red zone corresponding to rhein-8-glucoside may be visible.

- D. Place about 25 mg of the powdered drug (180) in a conical flask and add 50 ml of *water R* and 2 ml of *hydrochloric acid R*. Heat in a water-bath for 15 min, cool and shake with 40 ml of *ether R*. Separate the ether, dry over *anhydrous sodium sulphate R*, evaporate 5 ml to dryness and to the cooled residue add 5 ml of *dilute ammonia R1*. A yellow or orange colour develops. Heat on a water-bath for 2 min. A reddish-violet colour develops.

TESTS

Foreign matter (2.8.2). Not more than 3 per cent of foreign organs and not more than 1 per cent of foreign elements.

Loss on drying (2.2.32). Not more than 12.0 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100-105 °C for 2 h.

Total ash (2.4.16). Not more than 12.0 per cent.

Ash insoluble in hydrochloric acid (2.8.1). Not more than 2.5 per cent.

ASSAY

Carry out the assay protected from bright light.

Place 0.150 g of the powdered drug (180) in a 100 ml flask. Add 30.0 ml of *water R*, mix, weigh and place in a water-bath. Heat under a reflux condenser for 15 min. Allow to cool, weigh and adjust to the original mass with *water R*. Centrifuge and transfer 20.0 ml of the supernatant liquid to a 150 ml separating funnel. Add 0.1 ml of *dilute hydrochloric acid R* and shake with three quantities, each of 15 ml, of *chloroform R*. Allow to separate and discard the chloroform layer. Add 0.10 g of *sodium hydrogen carbonate R* and shake for 3 min. Centrifuge and transfer 10.0 ml of the supernatant liquid to a 100 ml round-bottomed flask with a ground-glass neck. Add 20 ml of *ferric chloride solution R1* and mix. Heat for 20 min under a reflux condenser in a water-bath with the water level above that of the liquid in the flask; add 1 ml of *hydrochloric acid R* and heat for a further 20 min, with frequent shaking, to dissolve the precipitate. Cool, transfer the mixture to a separating funnel and shake with three quantities, each of 25 ml, of *ether R* previously used to rinse the flask. Combine the ether layers and wash with two quantities, each of 15 ml, of *water R*. Transfer the ether layers to a volumetric flask and dilute to 100.0 ml with *ether R*. Evaporate 10.0 ml carefully to dryness and dissolve the residue in 10.0 ml of a 5 g/l solution of *magnesium acetate R* in *methanol R*. Measure the absorbance (2.2.25) at 515 nm, using *methanol R* as the compensation liquid.

Calculate the percentage content of sennoside B from the expression:

$$\frac{A \times 1.25}{m}$$

taking the specific absorbance to be 240.

A = absorbance at 515 nm,

m = mass of the substance to be examined, in grams.

STORAGE

Store protected from light and moisture.

01/2005:1261

SENNA LEAF DRY EXTRACT, STANDARDISED

Sennae folii extractum siccum normatum

DEFINITION

Standardised senna leaf dry extract is produced from *Senna leaf (0206)*. It contains not less than 5.5 per cent and not more than 8.0 per cent of hydroxyanthracene glycosides, calculated as sennoside B ($C_{42}H_{38}O_{20}$; M_r 863) with reference to the dried extract.

The measured content does not deviate from the value stated on the label by more than ± 10 per cent.

PRODUCTION

The extract is produced from the drug and ethanol 50 to 80 per cent V/V with an appropriate procedure.

CHARACTERS

Brownish or brown powder.

IDENTIFICATION

- A. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution. To 0.1 g of the extract add 5 ml of a mixture of equal volumes of *alcohol R* and *water R* and heat to boiling. Cool and centrifuge. Use the supernatant liquid.

Reference solution. Dissolve 10 mg of *senna extract CRS* in 1 ml of a mixture of equal volumes of *alcohol R* and *water R* (a slight residue remains).

Apply separately to the plate, as bands, 10 µl of each solution. Develop over a path of 10 cm using a mixture of 1 volume of *glacial acetic acid R*, 30 volumes of *water R*, 40 volumes of *ethyl acetate R* and 40 volumes of *1-propanol R*. Allow the plate to dry in air, spray with a 20 per cent V/V solution of *nitric acid R* and heat at 120 °C for 10 min. Allow to cool and spray with a 50 g/l solution of *potassium hydroxide R* in *alcohol (50 per cent V/V) R* until the zones appear. The principal zones in the chromatogram obtained with the test solution are similar in position, colour and size to the principal zones in the chromatogram obtained with the reference solution. The chromatograms show in the lower third a prominent brown zone corresponding to sennoside B and above it a yellow zone followed by another prominent brown zone corresponding to sennoside A. In the upper half of the chromatograms are visible, in increasing R_f value, a prominent reddish-brown band and an orange-brown zone followed by a faint pink band and two yellow bands. Close to the solvent front a dark pink zone appears, which may be followed by several faint bands.

- B. Place about 25 mg of the extract in a conical flask and add 50 ml of *water R* and 2 ml of *hydrochloric acid R*. Heat in a water-bath for 15 min, cool and shake with 40 ml of *ether R*. Separate the ether, dry over *anhydrous sodium sulphate R*, evaporate 5 ml to dryness and to

the cooled residue add 5 ml of *dilute ammonia R1*. A yellow or orange colour develops. Heat on a water-bath for 2 min. A reddish-violet colour develops.

TESTS

Loss on drying (2.8.17): maximum 5.0 per cent.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10^4 micro-organisms per gram, of which not more than 10^2 fungi per gram, determined by plate-count. It complies with the tests for *Escherichia coli* and for *Salmonella* (2.6.13).

ASSAY

Carry out the assay protected from bright light.

Place 0.150 g of the extract in a 100 ml flask, dissolve in *water R* and dilute to 100.0 ml with the same solvent. Filter the solution, discard the first 10 ml of the filtrate. Transfer 20.0 ml of the filtrate to a 150 ml separating funnel. Add 0.1 ml of *dilute hydrochloric acid R* and shake with three quantities, each of 15 ml, of *ether R*. Allow the layers to separate and discard the ether layer. Add 0.10 g of *sodium hydrogen carbonate R* to the aqueous layer and shake for 3 min. Centrifuge and transfer 10.0 ml of the supernatant liquid to a 100 ml round-bottomed flask with a ground-glass neck. Add 20 ml of *ferric chloride solution R1* and mix. Heat for 20 min under a reflux condenser in a water-bath with the water level above that of the liquid in the flask; add 3 ml of *hydrochloric acid R* and heat for a further 30 min with frequent shaking to dissolve the precipitate. Cool, transfer the mixture to a separating funnel and shake with three quantities, each of 25 ml, of *ether R* previously used to rinse the flask. Combine the ether layers and wash with two quantities, each of 15 ml, of *water R*. Transfer the ether layers to a volumetric flask and dilute to 100.0 ml with *ether R*. Evaporate 10.0 ml carefully to dryness and dissolve the residue in 10.0 ml of a 5.0 g/l solution of *magnesium acetate R* in *methanol R*. Measure the absorbance (2.2.25) at 515 nm using *methanol R* as the compensation liquid.

Calculate the percentage of hydroxyanthracene glycosides expressed as sennoside B from the expression:

$$\frac{A \times 4.167}{m}$$

i.e. taking the specific absorbance of sennoside B to be 240.

A = absorbance at 515 nm,

m = mass of the substance to be examined, in grams.

STORAGE

Store in an airtight container, protected from light.

LABELLING

The label states the content of hydroxyanthracene glycosides.

01/2005:0207

SENNA PODS, ALEXANDRIAN

Sennae fructus acutifoliae

DEFINITION

Alexandrian senna pods consist of the dried fruit of *Cassia senna* L. (*C. acutifolia* Delile). They contain not less than 3.4 per cent of hydroxyanthracene glycosides, calculated as sennoside B ($C_{42}H_{38}O_{20}$; M_r 863) with reference to the dried drug.

CHARACTERS

Alexandrian senna pods have a slight odour.

They have the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

A. They occur as flattened reniform pods, green to greenish-brown with brown patches at the positions corresponding to the seeds, usually 40 mm to 50 mm long and at least 20 mm wide. At one end is a styler point and at the other a short stalk. The pods contain six or seven flattened and obovate seeds, green to pale brown, with a continuous network of prominent ridges on the testa.

B. Reduce to a powder (355). The powder is brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: epicarp with polygonal cells and a small number of conical warty trichomes and occasional anomocytic or paracytic stomata (2.8.3); fibres in two crossed layers accompanied by a crystal sheath of calcium oxalate prisms; characteristic palisade cells in the seed and stratified cells in the endosperm; clusters and prisms of calcium oxalate.

C. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. To 0.5 g of the powdered drug (180) add 5 ml of a mixture of equal volumes of *alcohol R* and *water R* and heat to boiling. Centrifuge and use the supernatant liquid.

Reference solution. Dissolve 10 mg of *senna extract CRS* in 1 ml of a mixture of equal volumes of *alcohol R* and *water R* (a slight residue remains).

Apply to the plate as bands 20 mm by 2 mm, 10 µl of each solution. Develop over a path of 10 cm using a mixture of 1 volume of *glacial acetic acid R*, 30 volumes of *water R*, 40 volumes of *ethyl acetate R* and 40 volumes of *propanol R*. Allow the plate to dry in air, spray with a 20 per cent V/V solution of *nitric acid R* and heat at 120 °C for 10 min. Allow to cool and spray with a 50 g/l solution of *potassium hydroxide R* in *alcohol (50 per cent V/V) R* until the zones appear. The principal zones in the chromatogram obtained with the test solution are similar in position (sennosides B, A, D and C in the order of increasing R_f value), colour and size to the principal zones in the chromatogram obtained with the reference solution. Between the zones corresponding to sennosides D and C, a red zone corresponding to rhein-8-glucoside may be visible. The zones corresponding to sennosides D and C are faint in the chromatogram obtained with the test solution.

D. Place about 25 mg of the powdered drug (180) in a conical flask and add 50 ml of *water R* and 2 ml of *hydrochloric acid R*. Heat in a water-bath for 15 min, cool and shake with 40 ml of *ether R*. Separate the ether, dry over *anhydrous sodium sulphate R*, evaporate 5 ml to dryness and to the cooled residue add 5 ml of *dilute ammonia R1*. A yellow or orange colour develops. Heat on a water-bath for 2 min. A reddish-violet colour develops.

TESTS

Foreign matter (2.8.2). Not more than 1 per cent.

Loss on drying (2.2.32). Not more than 12.0 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100-105 °C for 2 h.

Total ash (2.4.16). Not more than 9.0 per cent.

Ash insoluble in hydrochloric acid (2.8.1). Not more than 2.0 per cent.

ASSAY

Carry out the assay protected from bright light.

Place 0.150 g of the powdered drug (180) in a 100 ml flask. Add 30.0 ml of *water R*, mix, weigh and place in a water-bath. Heat under a reflux condenser for 15 min. Allow to cool, weigh and adjust to the original mass with *water R*. Centrifuge and transfer 20.0 ml of the supernatant liquid to a 150 ml separating funnel. Add 0.1 ml of *dilute hydrochloric acid R* and shake with three quantities, each of 15 ml, of *chloroform R*. Allow to separate and discard the chloroform layer. Add 0.10 g of *sodium hydrogen carbonate R* and shake for 3 min. Centrifuge and transfer 10.0 ml of the supernatant liquid to a 100 ml round-bottomed flask with a ground-glass neck. Add 20 ml of *ferric chloride solution R1* and mix. Heat for 20 min under a reflux condenser in a water-bath with the water level above that of the liquid in the flask; add 1 ml of *hydrochloric acid R* and heat for a further 20 min, with frequent shaking, to dissolve the precipitate. Cool, transfer the mixture to a separating funnel and shake with three quantities, each of 25 ml, of *ether R* previously used to rinse the flask. Combine the ether layers and wash with two quantities, each of 15 ml, of *water R*. Transfer the ether layers to a volumetric flask and dilute to 100.0 ml with *ether R*. Evaporate 10.0 ml carefully to dryness and dissolve the residue in 10.0 ml of a 5 g/l solution of *magnesium acetate R* in *methanol R*. Measure the absorbance (2.2.25) at 515 nm using *methanol R* as the compensation liquid. Calculate the percentage content of sennoside B from the expression:

$$\frac{A \times 1.25}{m}$$

i.e. taking the specific absorbance to be 240.

A = absorbance at 515 nm,

m = mass of the substance to be examined, in grams.

STORAGE

Store protected from light and moisture.

01/2005:0208

SENNA PODS, TINNEVELLY

Sennae fructus angustifoliae

DEFINITION

Tinnevelly senna pods consist of the dried fruit of *Cassia angustifolia* Vahl. They contain not less than 2.2 per cent of hydroxyanthracene glycosides, calculated as sennoside B ($C_{42}H_{38}O_{20}$; M_r 863) with reference to the dried drug.

CHARACTERS

Tinnevelly senna pods have a slight odour.

They have the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

A. They occur as flattened, slightly reniform pods, yellowish-brown to brown with dark brown patches at the positions corresponding to the seeds, usually 35 mm to 60 mm long and 14 mm to 18 mm wide. At one end is a stylar point and at the other a short stalk. The pods contain five to eight flattened and obovate seeds, green to pale brown, with incomplete, wavy, transverse ridges on the testa.

B. Reduce to a powder (355). The powder is brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: epicarp with polygonal cells and a small number of conical warty trichomes and occasional anomocytic or paracytic stomata (2.8.3); fibres in two crossed layers accompanied by a crystal sheath of calcium oxalate prisms; characteristic palisade cells in the seed and stratified cells in the endosperm; clusters and prisms of calcium oxalate.

C. Examine by thin-layer chromatography (2.2.27), using *silica gel g R* as the coating substance.

Test solution. To 0.5 g of the powdered drug (180) add 5 ml of a mixture of equal volumes of *alcohol R* and *water R* and heat to boiling. Centrifuge and use the supernatant liquid.

Reference solution. Dissolve 10 mg of *senna extract CRS* in 1 ml of a mixture of equal volumes of *alcohol R* and *water R* (a slight residue remains).

Apply to the plate as bands 20 mm by 2 mm 10 µl of each solution. Develop over a path of 10 cm using a mixture of 1 volume of *glacial acetic acid R*, 30 volumes of *water R*, 40 volumes of *ethyl acetate R* and 40 volumes of *propanol R*. Allow the plate to dry in air, spray with a 20 per cent V/V solution of *nitric acid R* and heat at 120 °C for 10 min. Allow to cool and spray with a 50 g/l solution of *potassium hydroxide R* in *alcohol* (50 per cent V/V) *R* until the zones appear. The principal zones in the chromatogram obtained with the test solution are similar in position (sennosides B, A, D and C in the order of increasing R_f value), colour and size to the principal zones in the chromatogram obtained with the reference solution. Between the zones corresponding to sennosides D and C a red zone corresponding to rhein-8-glucoside may be visible. The zones corresponding to sennosides D and C are faint in the chromatogram obtained with the test solution.

D. Place about 25 mg of the powdered drug (180) in a conical flask and add 50 ml of *water R* and 2 ml of *hydrochloric acid R*. Heat in a water-bath for 15 min, cool and shake with 40 ml of *ether R*. Separate the ether, dry over *anhydrous sodium sulphate R*, evaporate 5 ml to dryness and to the cooled residue add 5 ml of *dilute ammonia R1*. A yellow or orange colour develops. Heat on a water-bath for 2 min. A reddish-violet colour develops.

TESTS

Foreign matter (2.8.2). Not more than 1 per cent.

Loss on drying (2.2.32). Not more than 12.0 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100-105 °C for 2 h.

Total ash (2.4.16). Not more than 9.0 per cent.

Ash insoluble in hydrochloric acid (2.8.1). Not more than 2.0 per cent.

ASSAY

Carry out the assay protected from bright light.

Place 0.150 g of the powdered drug (180) in a 100 ml flask. Add 30.0 ml of *water R*, mix, weigh and place in a water-bath. Heat under a reflux condenser for 15 min. Allow to cool, weigh and adjust to the original mass with *water R*. Centrifuge and transfer 20.0 ml of the supernatant liquid to a 150 ml separating funnel. Add 0.1 ml of *dilute hydrochloric acid R* and shake with three quantities, each of 15 ml, of *chloroform R*. Allow to separate and discard the chloroform layer. Add 0.10 g of *sodium hydrogen carbonate R* and shake for 3 min. Centrifuge and transfer 10.0 ml of the

supernatant liquid to a 100 ml round-bottomed flask with a ground-glass neck. Add 20 ml of *ferric chloride solution R1* and mix. Heat for 20 min under a reflux condenser in a water-bath with the water level above that of the liquid in the flask; add 1 ml of *hydrochloric acid R* and heat for a further 20 min, with frequent shaking, to dissolve the precipitate. Cool, transfer the mixture to a separating funnel and shake with three quantities, each of 25 ml, of *ether R* previously used to rinse the flask. Combine the ether layers and wash with two quantities, each of 15 ml, of *water R*. Transfer the ether layers to a volumetric flask and dilute to 100.0 ml with *ether R*. Evaporate 10.0 ml carefully to dryness and dissolve the residue in 10.0 ml of a 5 g/l solution of *magnesium acetate R* in *methanol R*. Measure the absorbance (2.2.25) at 515 nm using *methanol R* as the compensation liquid. Calculate the percentage content of sennoside B from the expression:

$$\frac{A \times 1.25}{m}$$

i.e. taking the specific absorbance to be 240.

A = absorbance at 515 nm,

m = mass of the substance to be examined, in grams.

STORAGE

Store protected from light and moisture.

01/2005:0788

SERINE

Serinum

$C_3H_7NO_3$

M_r 105.1

DEFINITION

Serine contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (S)-2-amino-3-hydroxypropanoic acid, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder or colourless crystals, freely soluble in water, practically insoluble in alcohol.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

- It complies with the test for specific optical rotation (see Tests).
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *serine CRS*. Examine the substances prepared as discs.
- Examine the chromatograms obtained in the test for ninhydrin-positive substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- To 1 ml of a 10 g/l solution of the substance to be examined in a test-tube, add 5 ml of a 20 g/l solution of *sodium periodate R*. Heat on a water-bath and collect the vapour on glass wool moistened with *water R* and

inserted in the opening of the test tube. After heating for 5 min, transfer the glass wool to a test-tube containing 1 ml of a 15 g/l solution of *chromotropic acid, sodium salt R* and 3 ml of *sulphuric acid R*. Heat on a water-bath for 10 min. A violet-red colour is produced.

TESTS

Solution S. Dissolve 2.5 g in *distilled water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, Method II).

Specific optical rotation (2.2.7). Dissolve 2.50 g in *dilute hydrochloric acid R* and dilute to 25.0 ml with the same acid. The specific optical rotation is + 14.0 to + 16.0, calculated with reference to the dried substance.

Ninhydrin-positive substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution (a). Dissolve 0.10 g of the substance to be examined in 0.1 M *hydrochloric acid* and dilute to 10 ml with the same acid.

Test solution (b). Dilute 1 ml of test solution (a) to 50 ml with *water R*.

Reference solution (a). Dissolve 10 mg of *serine CRS* in 0.1 M *hydrochloric acid* and dilute to 50 ml with the same acid.

Reference solution (b). Dilute 5 ml of test solution (b) to 20 ml with *water R*.

Reference solution (c). Dissolve 10 mg of *methionine CRS* and 10 mg of *serine CRS* in 0.1 M *hydrochloric acid* and dilute to 25 ml with the same acid.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of *glacial acetic acid R*, 20 volumes of *water R* and 60 volumes of *butanol R*. Allow the plate to dry in air, spray with *ninhydrin solution R* and heat at 100 °C to 105 °C for 15 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Chlorides (2.4.4). Dilute 5 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides (200 ppm).

Sulphates (2.4.13). Dilute 10 ml of solution S to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (300 ppm).

Ammonium (2.4.1). 50 mg complies with limit test B for ammonium (200 ppm). Prepare the standard using 0.1 ml of *ammonium standard solution (100 ppm NH₄) R*.

Iron (2.4.9). In a separating funnel, dissolve 1.0 g in 10 ml of *dilute hydrochloric acid R*. Shake with three quantities, each of 10 ml, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers add 10 ml of *water R* and shake for 3 min. The aqueous layer complies with the limit test for iron (10 ppm).

Heavy metals (2.4.8). Dissolve 2.0 g in *water R* and dilute to 20 ml with the same solvent. 12 ml of the solution complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in 3 ml of *anhydrous formic acid R*. Add 30 ml of *anhydrous acetic acid R*. Using 0.1 ml of *naphtholbenzein solution R* as indicator, titrate with 0.1 M *perchloric acid* until the colour changes from brownish-yellow to green.

1 ml of 0.1 M *perchloric acid* is equivalent to 10.51 mg of $C_{20}H_{16}Cl_3N_3O_4S$.

STORAGE

Store protected from light.

01/2005:1148

SERTACONAZOLE NITRATE

Sertaconazoli nitras

 $C_{20}H_{16}Cl_3N_3O_4S$
 M_r 500.8

DEFINITION

Sertaconazole nitrate contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (RS)-1-[2-[(7-chloro-1-benzothiophen-3-yl)methoxy]-2-(2,4-dichlorophenyl)ethyl]-1H-imidazole nitrate, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white powder, practically insoluble in water, soluble in methanol, sparingly soluble in alcohol and in methylene chloride.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D, E.

- Melting point (2.2.14): 156 °C to 161 °C.
- Dissolve 0.1 g in *methanol R* and dilute to 100 ml with the same solvent. Dilute 10 ml of the solution to 100 ml with *methanol R*. Examined between 240 nm and 320 nm (2.2.25), the solutions shows three absorption maxima, at 260 nm, 293 nm and 302 nm. The ratio of the absorbance measured at the maximum at 302 nm to that measured at the maximum at 293 nm is 1.16 to 1.28.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *sertaconazole nitrate CRS*. Dry the substances at 100-105 °C for 2 h and examine as discs prepared using *potassium bromide R*.
- Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.
Test solution. Dissolve 40 mg of the substance to be examined in a mixture of 1 volume of *concentrated ammonia R* and 9 volumes of *methanol R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dissolve 40 mg of *sertaconazole nitrate CRS* in a mixture of 1 volume of *concentrated ammonia R* and 9 volumes of *methanol R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dissolve 20 mg of *miconazole nitrate CRS* in reference solution (a) and dilute to 5 ml with the same solution.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 1 volume of *concentrated ammonia R*, 40 volumes of *toluene R* and 60 volumes of *dioxan R*. Dry the plate in a current of air for 15 min and expose the plate to iodine vapour for 30 min. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

E. About 1 mg gives the reaction of nitrates (2.3.1).

TESTS

Appearance of solution. Dissolve 0.1 g in *alcohol R* and dilute to 10 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₅ (2.2.2, *Method II*).

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 10.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dilute 5.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 20.0 ml with the mobile phase.

Reference solution (b). Dissolve 5.0 mg of *sertaconazole nitrate CRS* and 5.0 mg of *miconazole nitrate CRS* in the mobile phase and dilute to 20.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 50.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.0 mm in internal diameter packed with *nitrile silica gel for chromatography R1* (10 µm),
- as mobile phase at a flow rate of 1.6 ml/min a mixture of 37 volumes of *acetonitrile R* and 63 volumes of a 1.5 g/l solution of *sodium dihydrogen phosphate R*,
- as detector a spectrophotometer set at 220 nm.

Inject 20 µl of reference solution (a) and 20 µl of reference solution (b). When the chromatograms are recorded in the prescribed conditions, the retention times are: nitrate ion, about 1 min; miconazole, about 17 min; sertaconazole, about 19 min. When using a recorder, adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with reference solution (a) is not less than 25 per cent of the full scale of the recorder. The test is not valid unless in the chromatogram obtained with reference solution (b), the resolution between the peaks due to miconazole and sertaconazole is at least 2.0.

Inject separately 20 µl of the test solution and 20 µl of reference solution (a). Continue the chromatography for 1.3 times the retention time of the principal peak. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak and the peak due to nitrate ion, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.25 per cent) and the sum of the areas of such peaks, is not greater than twice the area of the principal peak in

the chromatogram obtained with the reference solution (a) (0.5 per cent). Disregard any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a).

Water (2.5.12). Not more than 1.0 per cent, determined on 0.50 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.400 g in 50 ml of a mixture of equal volumes of *anhydrous acetic acid R* and *methyl ethyl ketone R*. Titrate with 0.1 M perchloric acid, determining the end-point potentiometrically (2.2.20). Carry out a blank titration.

1 ml of 0.1 M perchloric acid is equivalent to 50.08 mg of $C_{20}H_{16}Cl_3N_3O_4S$.

STORAGE

Store protected from light.

IMPURITIES

A. (1*RS*)-1-(2,4-dichlorophenyl)-2-(1*H*-imidazol-1-yl)ethanol,

B. R = Br: 3-(bromomethyl)-7-chloro-1-benzothiophen,

C. R = OH: (7-chloro-1-benzothiophen-3-yl)methanol.

01/2005:0433

SESAME OIL, REFINED

Sesami oleum raffinatum

DEFINITION

Refined sesame oil is the fatty oil obtained from the ripe seeds of *Sesamum indicum* L. by expression or extraction, then refined. Improved colour and odour may be obtained by further refining. It may contain a suitable antioxidant.

CHARACTERS

A clear, light yellow liquid, almost colourless, practically insoluble in alcohol, miscible with light petroleum.

It has a relative density of about 0.919.

It solidifies to a soft mass at about $-4\text{ }^{\circ}\text{C}$.

IDENTIFICATION

First identification: C.

Second identification: A, B.

A. It complies with the test for refractive index (see Tests).

B. Carry out the identification of fatty oils by thin-layer chromatography (2.3.2). The chromatogram obtained is similar to the type chromatogram for sesame oil.

C. It complies with the test for composition of triglycerides (see Tests).

TESTS

Refractive index (2.2.6): 1.470 to 1.476.

Acid value (2.5.1). Not more than 0.6, determined on 10.0 g. If intended for use in the manufacture of parenteral dosage forms, not more than 0.3.

Peroxide value (2.5.5). Not more than 10.0. If intended for use in the manufacture of parenteral dosage forms, not more than 5.0.

Figure 0433-1. – Chromatogram for the composition of triglycerides in sesame oil

01/2005:1149

Unsaponifiable matter (2.5.7). Not more than 2.0 per cent, determined on 5.0 g.

Alkaline impurities (2.4.19). It complies with the test for alkaline impurities in fatty oils.

Cottonseed oil. Mix 5 ml in a test-tube with 5 ml of a mixture of equal volumes of *pentanol R* and a 10 g/l solution of *sulphur R* in *carbon disulphide R*. Warm the mixture carefully until the carbon disulphide is expelled, and immerse the tube to one-third of its depth in boiling *saturated sodium chloride solution R*. No reddish colour develops within 15 min.

Composition of triglycerides. Examine by liquid chromatography (2.2.29).

Test solution. Into a 10 ml volumetric flask, weigh 0.200 g and dilute to 10.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- two stainless steel columns 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm) in series,
- as mobile phase at a flow rate of 1.0 ml/min a mixture of 1 volume of *methylene chloride R* and 2 volumes of *acetonitrile R*,
- as detector a refractometer.

Inject 20 µl of the test solution. Identify the peaks from the type chromatogram (Figure 0433.-1). The fatty acid radicals are designated as linolenic (Ln), linoleic (L), oleic (O), palmitic (P) and stearic (S).

Calculate the percentage content of triglycerides from the areas of the peaks in the chromatogram obtained with the test solution by the normalisation procedure.

The composition of triglycerides is the following:

- LLL: 7.0 per cent to 19.0 per cent,
- OLL: 13.0 per cent to 30.0 per cent,
- PLL: 5.0 per cent to 9.0 per cent,
- OOL: 14.0 per cent to 25.0 per cent,
- POL: 8.0 per cent to 16.0 per cent,
- OOO: 5.0 per cent to 14.0 per cent,
- SOL: 2.0 per cent to 8.0 per cent,
- POO: 2.0 per cent to 10.0 per cent.

Water (2.5.12). If intended for use in the manufacture of parenteral dosage forms, not more than 0.05 per cent, determined on 5.0 g by the semi-micro determination of water.

STORAGE

Store in an airtight, well-filled container, protected from light.

Refined sesame oil intended for use in the manufacture of parenteral dosage forms is stored under an inert gas in an airtight container.

When the container has been opened, its contents are to be used as soon as possible. Any part of the contents not used at once is protected by an atmosphere of an inert gas.

LABELLING

The label states:

- whether the oil is obtained by expression or extraction,
- where applicable, the name and amount of any added antioxidant,
- where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms,
- where applicable, the name of the inert gas used.

SHELLAC

Lacca

DEFINITION

Shellac is a purified material obtained from the resinous secretion of the female insect *Kerria lacca* (Kerr) Lindinger (*Laccifer lacca* Kerr). There are four types of shellac depending on the nature of the treatment of crude secretion (seedlac): wax-containing shellac, bleached shellac, dewaxed shellac and bleached, dewaxed shellac.

Wax-containing shellac is obtained from seedlac; it is purified by filtration of the molten substance and/or by hot extraction using a suitable solvent.

Bleached shellac is obtained from seedlac by treatment with sodium hypochlorite after dissolution in a suitable alkaline solution, precipitation by dilute acid and drying.

Dewaxed shellac is obtained from wax-containing shellac or seedlac by treatment with a suitable solvent and removal of the insoluble wax by filtering.

Bleached, dewaxed shellac is obtained from wax-containing shellac or seedlac by treatment with sodium hypochlorite after dissolution in a suitable alkaline solution; the insoluble wax is removed by filtration. It is precipitated by dilute acid and dried.

CHARACTERS

Shellac occurs as brownish-orange or yellow, shining, translucent, hard or brittle, more or less thin flakes (wax-containing shellac and dewaxed shellac), or a creamy white or brownish-yellow powder (bleached shellac and bleached, dewaxed shellac).

Shellac is practically insoluble in water. With ethanol, it gives a more or less opalescent solution (wax containing shellac and bleached shellac) or a clear solution (dewaxed shellac and bleached, dewaxed shellac). When warmed, it is sparingly soluble or soluble in alkaline solutions.

IDENTIFICATION

- A. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Heat 0.25 g of the powdered substance (500) on a water-bath with 2 ml of *dilute sodium hydroxide solution R* for 5 min. Cool, add 5 ml of *ethyl acetate R* and slowly, with stirring, 2 ml of *dilute acetic acid R*. Shake and filter the upper layer through *anhydrous sodium sulphate R*.

Reference solution. Dissolve 6.0 mg of *aleuritic acid R* in 1.0 ml of *methanol R*, heating slightly if necessary.

Apply to the plate as bands 10 µl of each solution. Develop twice over a path of 15 cm using a mixture of 1 volume of *acetic acid R*, 8 volumes of *methanol R*, 32 volumes of *methylene chloride R* and 60 volumes of *ethyl acetate R*. Allow the plate to dry in air. Spray the plate with *anisaldehyde solution R*. Heat the plate at 100° C to 105° C for 5 min to 10 min and examine in daylight. The chromatogram obtained with the test solution shows several coloured zones, one of which is similar in position and colour to the zone in the chromatogram obtained with the reference solution. Above this zone the chromatogram obtained with the test solution shows a pink zone and below it several violet zones. Below the zone corresponding to aleuritic acid,

there is a light blue zone (shellolic acid) accompanied by zones of the same colour but of lower intensity. Other faint grey and violet zones may be visible.

- B. Examine the chromatograms obtained in the test for colophony. For wax-containing shellac, in the chromatogram obtained with the test solution, a more or less strong bluish-grey zone is visible, just above the zone due to thymolphthalein in the chromatogram obtained with the reference solution. For dewaxed shellac, no such zone is visible just above the zone due to thymolphthalein in the chromatogram obtained with the reference solution.

TESTS

Colophony. Examine by thin-layer chromatography (2.2.27), as described under identification test A with the following modifications.

Test solution. Dissolve 50 mg of the powdered substance (500), while heating, in a mixture of 0.5 ml of *methylene chloride R* and 0.5 ml of *methanol R*.

Reference solution. Dissolve 2.0 mg of *thymolphthalein R* in 1.0 ml of *methanol R*.

Examine the plate in ultraviolet light at 254 nm. Mark the quenching zones in the chromatogram obtained with the test solution that have similar R_f values to that of the quenching zone of thymolphthalein in the chromatogram obtained with the reference solution. Spray with *anisaldehyde solution R*, heat the plate at 100 °C to 105 °C for 5 min to 10 min and examine in daylight. The chromatogram obtained with the reference solution shows a principal zone with a reddish-violet colour (thymolphthalein). None of the quenching zones in the chromatogram obtained with the test solution that have an R_f value similar to the zone due to thymolphthalein in the reference solution show a more or less strong violet or brownish colour (colophony). Disregard any faint violet zone at this level that does not show quenching before spraying and heating.

Acid value (2.5.1): 65 to 95, calculated with reference to the dried substance. Examine 1.00 g of the coarsely ground substance. Determine the end-point by potentiometry (2.2.20).

Arsenic (2.4.2). Introduce 0.33 g of the substance to be examined and 5 ml of *sulphuric acid R* into a combustion flask. Carefully add a few millilitres of *strong hydrogen peroxide solution R* and heat to boiling until a clear, colourless solution is obtained. Continue heating to eliminate the water and as much sulphuric acid as possible and dilute to 25 ml with *water R*. The solution complies with limit test A for arsenic (3 ppm).

Heavy metals (2.4.8). 2.0 g complies with limit test D for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 2.0 per cent for unbleached shellac and not more than 6.0 per cent for bleached shellac, determined on 1.000 g of the powdered substance (500) by drying in an oven at 40 °C to 45 °C for 24 h.

STORAGE

Store protected from light. Store bleached shellac and bleached, dewaxed shellac at a temperature not exceeding 15 °C.

LABELLING

The label indicates the type of shellac.

01/2005:0434

SILICA, COLLOIDAL ANHYDROUS

Silica colloidalis anhydrica

SiO₂ M_r 60.1

DEFINITION

Colloidal anhydrous silica contains not less than 99.0 per cent and not more than the equivalent of 100.5 per cent of SiO₂, determined on the ignited substance.

CHARACTERS

A light, fine, white, amorphous powder, with a particle size of about 15 nm, practically insoluble in water and in mineral acids except hydrofluoric acid. It dissolves in hot solutions of alkali hydroxides.

IDENTIFICATION

About 20 mg gives the reaction of silicates (2.3.1).

TESTS

pH (2.2.3). Shake 1.0 g with 30 ml of *carbon dioxide-free water R*. The pH of the suspension is 3.5 to 5.5.

Chlorides (2.4.4). To 1.0 g add a mixture of 20 ml of *dilute nitric acid R* and 30 ml of *water R* and heat on a water-bath for 15 min, shaking frequently. Dilute to 50 ml with *water R* if necessary, filter and cool. 10 ml of the filtrate diluted to 15 ml with *water R* complies with the limit test for chlorides (250 ppm).

Heavy metals (2.4.8). Suspend 2.5 g in sufficient *water R* to produce a semi-fluid slurry. Dry at 140 °C. When the dried substance is white, break up the mass with a glass rod. Add 25 ml of 1 M *hydrochloric acid* and boil gently for 5 min, stirring frequently with the glass rod. Centrifuge for 20 min and filter the supernatant liquid through a membrane filter. To the residue in the centrifuge tube add 3 ml of *dilute hydrochloric acid R* and 9 ml of *water R* and boil. Centrifuge for 20 min and filter the supernatant liquid through the same membrane filter. Wash the residue with small quantities of *water R*, combine the filtrates and washings and dilute to 50 ml with *water R*. To 20 ml of the solution add 50 mg of *ascorbic acid R* and 1 ml of *concentrated ammonia R*. Neutralise with *dilute ammonia R2*. Dilute to 25 ml with *water R*. 12 ml of the solution complies with limit test A for heavy metals (25 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on ignition. Not more than 5.0 per cent, determined on 0.200 g by ignition in a platinum crucible at 900 °C for 2 h. Allow to cool in a desiccator before weighing.

ASSAY

To the residue obtained in the test for loss on ignition add 0.2 ml of *sulphuric acid R* and sufficient *alcohol R* to moisten the residue completely. Add 6 ml of *hydrofluoric acid R* and evaporate to dryness on a hot-plate at 95 °C to 105 °C, taking care to avoid loss from sputtering. Wash down the sides of the dish with 6 ml of *hydrofluoric acid R* and evaporate to dryness. Ignite at 900 °C, allow to cool in a desiccator and weigh.

The difference between the mass of the final residue and the mass of the residue obtained in the test for loss on ignition gives the amount of SiO₂ in the quantity of the substance to be examined used.

01/2005:0738 ASSAY

SILICA, COLLOIDAL HYDRATED**Silica colloidalis hydrica****DEFINITION**

Colloidal hydrated silica contains not less than 98.0 per cent and not more than the equivalent of 100.5 per cent of SiO_2 (M_r 60.1), determined on the ignited substance.

CHARACTERS

A white or almost white, light, fine, amorphous powder, practically insoluble in water and in mineral acids, with the exception of hydrofluoric acid. It dissolves in hot solutions of alkali hydroxides.

IDENTIFICATION

- A. About 20 mg gives the reaction of silicates (2.3.1).
B. When heated in an oven at 100 °C to 105 °C for 2 h, it shows a loss of mass greater than 3 per cent.

TESTS

Solution S. To 2.5 g add 50 ml of *hydrochloric acid R* and mix. Heat on a water-bath for 30 min, stirring from time to time. Maintain the original volume by adding *dilute hydrochloric acid R*. Evaporate to dryness. Add to the residue a mixture of 8 ml of *dilute hydrochloric acid R* and 24 ml of *water R*. Heat to boiling and filter under reduced pressure through a sintered-glass filter (16). Wash the residue on the filter with a hot mixture of 3 ml of *dilute hydrochloric acid R* and 9 ml of *water R*. Wash with small quantities of *water R*, combine the filtrate and washings and dilute to 50 ml with *water R*.

pH (2.2.3). Suspend 1.0 g in 30 ml of a 75 g/l solution of *potassium chloride R*. The pH of the suspension is 4.0 to 7.0.

Water-absorption capacity. In a mortar, triturate 5 g with 5 ml of *water R*, added drop by drop. The mixture remains powdery.

Substances soluble in hydrochloric acid. In a platinum dish, evaporate to dryness 10.0 ml of solution S and dry to constant mass at 100 °C to 105 °C. The mass of the residue is not more than 10 mg (2.0 per cent).

Chlorides (2.4.4). Heat 0.5 g with 50 ml of *water R* on a water-bath for 15 min. Dilute to 100 ml with *water R* and centrifuge at 1500 *g* for 5 min. 10 ml of the supernatant solution diluted to 15 ml with *water R* complies with the limit test for chlorides (0.1 per cent).

Sulphates (2.4.13). Dilute 2 ml of solution S to 100 ml with *distilled water R*. 15 ml of the solution complies with the limit test for sulphates (1 per cent).

Iron (2.4.9). To 2 ml of solution S add 28 ml of *water R*. 10 ml of the solution complies with the limit test for iron (300 ppm).

Heavy metals (2.4.8). To 20 ml of solution S add 50 mg of *hydroxylamine hydrochloride R* and 1 ml of *concentrated ammonia R*. Adjust to pH 3.5 by adding *dilute ammonia R2*, monitoring the pH potentiometrically. Dilute to 25 ml with *water R*. 12 ml of the solution complies with limit test A for heavy metals (25 ppm). Prepare the standard using *lead standard solution* (1 ppm Pb) *R*.

Loss on ignition. Not more than 20.0 per cent, determined on 0.200 g in a platinum crucible by heating at 100 °C to 105 °C for 1 h and then at 900 °C for 2 h.

ASSAY

To the residue obtained in the test for loss on ignition add 0.2 ml of *sulphuric acid R* and a quantity of *alcohol R* sufficient to moisten the residue completely. Add 6 ml of *hydrofluoric acid R* and evaporate to dryness at 95 °C to 105 °C, taking care to avoid loss from sputtering. Wash the inside of the dish with 6 ml of *hydrofluoric acid R* and evaporate to dryness again. Ignite at 900 °C, allow to cool in a desiccator and weigh. The difference between the mass of the final residue and that of the mass obtained in the test for loss on ignition corresponds to the mass of SiO_2 in the test sample.

01/2005:1562

SILICA, DENTAL TYPE**Silica ad usum dentalem****DEFINITION**

Dental type silica is an amorphous silica (precipitated, gel or obtained by flame hydrolysis). It contains not less than 94.0 per cent and not more than 100.5 per cent of SiO_2 determined on the ignited substance.

CHARACTERS

A white or almost white, light, fine amorphous powder, practically insoluble in water and in mineral acids. It dissolves in hydrofluoric acid and hot solutions of alkali hydroxides.

IDENTIFICATION

About 20 mg gives the reaction of silicates (2.3.1).

TESTS

Solution S. To 2.5 g add 50 ml of *hydrochloric acid R* and mix. Heat on a water-bath for 30 min, stirring from time to time. Evaporate to dryness. Add to the residue a mixture of 8 ml of *dilute hydrochloric acid R* and 24 ml of *water R*. Heat to boiling and filter under reduced pressure through a sintered-glass filter (16). Wash the residue on the filter with a hot mixture of 3 ml of *dilute hydrochloric acid R* and 9 ml of *water R*. Wash with small quantities of *water R*, combine the washings and the filtrate and dilute to 50 ml with *water R*.

pH (2.2.3). Suspend 5 g in a mixture of 5 ml of a 7.46 g/l solution of *potassium chloride R* and 90 ml of *carbon dioxide-free water R*. The pH of the suspension is 3.2 to 8.9.

Chlorides. Examine by liquid chromatography (2.2.29) as prescribed under sulphates.

Inject 25 µl of the test solution and 25 µl of the reference solution. In the chromatogram obtained with the test solution the area of any peak corresponding to chloride is not greater than that of the corresponding peak in the chromatogram obtained with the reference solution (0.3 per cent).

Sulphates. Examine by liquid chromatography (2.2.29).

Test solution. To 0.625 g add 30 ml of *water R* and boil for 2 h. Allow to cool and quantitatively transfer to a 50 ml graduated flask. Dilute to 50.0 ml with *water R*. Dilute 5.0 ml of the supernatant to 50.0 ml with *water R* and filter through a membrane filter (nominal pore size: 0.45 µm).

Reference solution. Dissolve 0.50 g of *anhydrous sodium sulphate R* and 0.062 g of *sodium chloride R* in *water R* and dilute to 1000.0 ml with *water R*. Dilute 5.0 ml of this solution to 50.0 ml with *water R*.

The chromatographic procedure may be carried out using:

- a non-metallic column 0.25 m long and 4.6 mm in internal diameter packed with a suitable anion-exchange resin (30 µm to 50 µm),
- as mobile phase at a flow rate of 1.2 ml/min a solution prepared as follows: dissolve 0.508 g of *sodium carbonate R* and 0.05 g of *sodium hydrogen carbonate R* in *water R* and dilute to 1000 ml with the same solvent,
- a conductivity detector,
- a loop injector.

Inject 25 µl of the test solution and 25 µl of the reference solution. When the chromatograms are recorded in the prescribed conditions, the retention times are: sulphate about 8 min and chloride about 4 min.

In the chromatogram obtained with the test solution the area of any peak corresponding to sulphate is not greater than that of the corresponding peak in the chromatogram obtained with the reference solution (4.0 per cent calculated as sodium sulphate).

Iron (2.4.9). Dilute 2 ml of solution S to 40 ml with *water R*. 10 ml of the solution complies with the limit test for iron (400 ppm).

Heavy metals (2.4.8). To 20 ml of solution S, add 50 mg of *hydroxylamine hydrochloride R* and 1 ml of *concentrated ammonia R*. Adjust to pH 3.5 by adding *dilute ammonia R2*, monitoring the pH potentiometrically. Dilute to 25 ml with *water R*. 12 ml of the solution complies with limit test A for heavy metals (25 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on ignition. Not more than 25.0 per cent, determined on 0.200 g in a platinum crucible by heating at 100 °C to 105 °C for 1 h and then at 1000 °C for 2 h.

ASSAY

To the residue obtained in the test for loss on ignition add 0.2 ml of *sulphuric acid R* and a quantity of *alcohol R* sufficient to moisten the residue completely. Add 6 ml of *hydrofluoric acid R* and evaporate to dryness at 95 °C to 105 °C, taking care to avoid loss from sputtering. Wash the inside of the crucible with 6 ml of *hydrofluoric acid R* and evaporate to dryness again. Ignite at 900 °C, allow to cool in a desiccator and weigh. The difference between the mass of the final residue and that of the mass obtained in the test for loss on ignition corresponds to the mass of SiO₂ in the test sample.

01/2005:0009

SILVER NITRATE

Argenti nitras

AgNO₃

M_r 169.9

DEFINITION

Silver nitrate contains not less than 99.0 per cent and not more than the equivalent of 100.5 per cent of AgNO₃.

CHARACTERS

A white, crystalline powder or transparent, colourless crystals, very soluble in water, soluble in alcohol.

IDENTIFICATION

- 10 mg gives the reaction of nitrates (2.3.1).
- 10 mg gives the reaction of silver (2.3.1).

TESTS

Solution S. Dissolve 2.0 g in *water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 2 ml of solution S add 0.1 ml of *bromocresol green solution R*. The solution is blue. To 2 ml of solution S add 0.1 ml of *phenol red solution R*. The solution is yellow.

Foreign salts. To 30 ml of solution S, add 7.5 ml of *dilute hydrochloric acid R*, shake vigorously, heat for 5 min on a water-bath and filter. Evaporate 20 ml of the filtrate to dryness on a water-bath and dry at 100-105 °C. The residue weighs not more than 2 mg (0.3 per cent).

Aluminium, lead, copper and bismuth. Dissolve 1.0 g in a mixture of 4 ml of *concentrated ammonia R* and 6 ml of *water R*. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

ASSAY

Dissolve 0.300 g in 50 ml of *water R* and add 2 ml of *dilute nitric acid R* and 2 ml of *ferric ammonium sulphate solution R2*. Titrate with 0.1 M *ammonium thiocyanate* until a reddish-yellow colour is obtained.

1 ml of 0.1 M *ammonium thiocyanate* is equivalent to 16.99 mg of AgNO₃.

STORAGE

Store in a non-metallic container, protected from light.

01/2005:1470

SIMETICONE

Simeticonum

DEFINITION

Simeticone is prepared by incorporation of 4 per cent to 7 per cent silica into poly(dimethylsiloxane) with a degree of polymerisation between 20 and 400. Simeticone contains 90.5 per cent to 99.0 per cent of poly(dimethylsiloxane).

PRODUCTION

Poly(dimethylsiloxane) is obtained by hydrolysis and polycondensation of dichlorodimethylsilane and chlorotrimethylsilane and the silica is modified at the surface by incorporation of methylsilyl groups.

CHARACTERS

A viscous, greyish-white, opalescent liquid, practically insoluble in water, very slightly soluble to practically insoluble in ethanol, practically insoluble in methanol, partly miscible with ethyl acetate, with methylene chloride, with methyl ethyl ketone and with toluene.

IDENTIFICATION

- Examine by infrared absorption spectrophotometry (2.2.24). Absorption maxima are observed at 2964 cm⁻¹, 2905 cm⁻¹, 1412 cm⁻¹, 1260 cm⁻¹ and 1020 cm⁻¹. Examine the substances as thin films between *sodium chloride R* plates.
- Heat 0.5 g in a test-tube over a small flame until white fumes begin to appear. Invert the tube over a second tube containing 1 ml of a 1 g/l solution of *chromotropic acid, sodium salt R* in *sulphuric acid R* so that the fumes reach the solution. Shake the second tube for about 10 s and heat on a water-bath for 5 min. The solution is violet.

C. The residue obtained in the test for silica under Assay, gives the reaction of silicates (2.3.1).

TESTS

Acidity. To 2.0 g add 25 ml of a mixture of equal volumes of *ethanol R* and *ether R* previously neutralised to 0.2 ml of *bromothymol blue solution R1*, and shake. Not more than 3.0 ml of 0.01 M *sodium hydroxide* is required to change the colour of the solution to blue.

Defoaming activity

Foaming solution. Dissolve 5.0 g of *docusate sodium R* in 1 litre of *water R* (warm to 50 °C if necessary).

Defoaming solution. To 50 ml of *methyl ethyl ketone R* add 0.250 g of simeticone, warm to not more than 50 °C with shaking.

Into a 250 ml cylindrical tube about 5 cm in diameter introduce 100 ml of foaming solution and 1 ml of defoaming solution. Close tightly and fix the tube on a suitable oscillating shaker that complies with the following conditions:

- 250 to 300 oscillations per minute,
- angle of oscillation of about 10°,
- oscillation radius of about 10 cm.

Shake for 10 s and record the time between the end of the shaking and the instant the first portion of foam-free liquid surface appears.

This duration does not exceed 15 s.

Mineral oils. Place 2.0 g in a test-tube and examine in ultraviolet light at 365 nm. The fluorescence is not more intense than that of a solution containing 0.1 ppm of *quinine sulphate R* in 0.005 M *sulphuric acid* examined in the same conditions.

Phenylated compounds. Dissolve 5.0 g with shaking in 10.0 ml of *cyclohexane R*. Determine the absorbance of the solution between 200 nm and 350 nm (2.2.25) using *cyclohexane R* as the compensation liquid. The corrected absorbance (absorbance measured at the maximum between 250 nm and 270 nm minus the absorbance measured at 300 nm) is not greater than 0.2.

Heavy metals. Mix 1.0 g with *methylene chloride R* and dilute to 20 ml with the same solvent. Add 1.0 ml of a freshly prepared 0.02 g/l solution of *dithizone R* in *methylene chloride R*, 0.5 ml of *water R* and 0.5 ml of a mixture of 1 volume of *dilute ammonia R2* and 9 volumes of a 2 g/l solution of *hydroxylamine hydrochloride R*. At the same time, prepare a standard as follows: to 20 ml of *methylene chloride R* add 1.0 ml of a freshly prepared 0.02 g/l solution of *dithizone R* in *methylene chloride R*, 0.5 ml of *lead standard solution* (10 ppm Pb) *R* and 0.5 ml of a mixture of 1 volume of *dilute ammonia R2* and 9 volumes of a 2 g/l solution of *hydroxylamine hydrochloride R*. Immediately shake each solution vigorously for 1 min. Any red colour in the test solution is not more intense than that in the standard (5 ppm).

Volatile matter. Not more than 1.0 per cent, determined on 1.00 g by heating in an oven at 150 °C for 2 h. Carry out the test using a dish 60 mm in diameter and 10 mm deep.

ASSAY

Silica. Not more than 7 per cent, determined on not less than 20.0 mg. Heat the substance to be examined to 800 °C increasing the temperature by 20 °C/min under a current of *nitrogen R* at a flow rate of 200 ml/min and weigh the residue (silica).

Dimeticone

Test solution. Place about 50 mg (*E*) in a screw-capped 125 ml cylindrical tube, add 25.0 ml of *toluene R*, swirl manually to disperse and add 50 ml of *dilute hydrochloric acid R*, close the tube and place on a vortex mixer; shake for 5 min. Transfer the contents of the tube to a separating funnel, allow to settle and transfer 5 ml of the upper layer to a screw-capped test tube containing 0.5 g of *anhydrous sodium sulphate R*. Cap and shake vigorously manually. Centrifuge to obtain a clear test solution.

Reference solution. Introduce about 0.20 g of *dimeticone CRS* in 100.0 ml of *toluene R*. Prepare the reference solution in the same way as for the test solution, using 25.0 ml of the dimeticone solution obtained above. Prepare a blank by shaking 10 ml of *toluene R* with 1 g of *anhydrous sodium sulphate R*. Centrifuge the resulting suspension.

Record the infrared absorption spectra for the test solution and the reference solution in 0.5 mm cells, from 1330 cm⁻¹ to 1180 cm⁻¹, and determine the absorbance of the band at 1260 cm⁻¹ (2.2.24).

Calculate the percentage content of dimeticone using the expression:

$$\frac{25C \times A_M \times 100}{A_E \times E}$$

A_M = absorbance of the test solution,

A_E = absorbance of the reference solution,

C = concentration of the reference solution, in milligrams per millilitre,

E = mass of the substance to be examined, in milligrams.

01/2005:1563

SIMVASTATIN

Simvastatinum

C₂₅H₃₈O₅

M_r 418.6

DEFINITION

Simvastatin contains not less than 97.0 per cent and not more than the equivalent of 102.0 per cent of (1*S*,3*R*,7*S*,8*S*,8*aR*)-8-[2-[(2*R*,4*R*)-4-hydroxy-6-oxotetrahydro-2*H*-pyran-2-yl]ethyl]-3,7-dimethyl-1,2,3,7,8,8*a*-hexahydronaphthalen-1-yl 2,2-dimethylbutanoate, calculated with reference to the dried substance. A suitable antioxidant may be added.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, very soluble in methylene chloride, freely soluble in alcohol.

IDENTIFICATION

- A. It complies with the test for specific optical rotation (see Tests).
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *simvastatin CRS*. Examine the substances prepared as discs.

TESTS

Appearance of solution. Dissolve 0.200 g in *methanol R* and dilute to 20 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution BY₇ (2.2.2, *Method II*).

Specific optical rotation (2.2.7). Dissolve 0.125 g in *acetonitrile R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 285 to + 300, calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29) as prescribed under Assay.

Inject 5 µl of reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained is at least 20 per cent of the full scale of the recorder. Inject 5 µl of test solution (a) and continue the chromatography for five times the retention time of simvastatin. When the chromatograms are recorded under the prescribed conditions the relative retentions are: impurity A about 0.45, lovastatin (impurity E) and epilovastatin (impurity F) about 0.60, impurity G about 0.80, impurity B about 2.38, impurity C about 2.42 and impurity D about 3.80 (retention time of simvastatin: about 2.6 min). In the chromatogram obtained with test solution (a): the area of the peak due to lovastatin and epilovastatin is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent); the area of any peak apart from the principal peak and the peak due to lovastatin and epilovastatin is not greater than 0.8 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent); the sum of the areas of all peaks, apart from the principal peak and the peak due to lovastatin and epilovastatin, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in a desiccator under high vacuum at 60 °C for 3 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Examine by liquid chromatography (2.2.29). *Prepare the solutions immediately before use.*

Solvent mixture. Prepare a mixture of 40 volumes of a solution of a 1.4 g/l solution of *potassium dihydrogen phosphate R*, adjusted to pH 4.0 with *phosphoric acid R*, and 60 volumes of *acetonitrile R*. Filter.

Test solution (a). Dissolve 75.0 mg of the substance to be examined in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Test solution (b). Dissolve 40.0 mg of the substance to be examined in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). Dissolve 1.0 mg of *simvastatin CRS* and 1.0 mg of *lovastatin CRS* in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (b). Dilute 0.5 ml of test solution (a) to 100.0 ml with the solvent mixture.

Reference solution (c). Dissolve 40.0 mg of *simvastatin CRS* in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.033 m long and 4.6 mm in internal diameter packed with *end-capped octadecylsilyl silica gel for chromatography R* (3 µm),
- as mobile phase at a flow rate of 3.0 ml/min:

Mobile phase A. Mix 50 volumes of *acetonitrile R* and 50 volumes of a 0.1 per cent V/V solution of *phosphoric acid R*,

Mobile phase B. A 0.1 per cent V/V solution of *phosphoric acid R* in *acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 4.5	100	0	isocratic
4.5 - 4.6	100 → 95	0 → 5	linear gradient
4.6 - 8.0	95 → 25	5 → 75	linear gradient
8.0 - 11.5	25	75	isocratic
11.5 - 11.6	25 → 100	75 → 0	linear gradient
11.6 - 13	100	0	re-equilibration

- as detector a spectrophotometer set at 238 nm.

Inject 5 µl of reference solution (a). The test and the assay are not valid unless, in the chromatogram obtained, the resolution between the peak corresponding to lovastatin and epilovastatin and the peak corresponding to simvastatin is at least 5.0. When the chromatograms are recorded under the prescribed conditions the retention times are: lovastatin and epilovastatin about 1.6 min and simvastatin about 2.6 min. Inject 5 µl of reference solution (c). Adjust the sensitivity of the system so that the height of the principal peak is at least 50 per cent of the full scale of the recorder. Inject 5 µl of test solution (b).

Calculate the content of simvastatin from the peak areas in the chromatograms obtained with test solution (b) and reference solution (c) and the declared content of *simvastatin CRS*.

STORAGE

Store under nitrogen, in an airtight container, protected from light.

LABELLING

The label states the name and concentration of any added antioxidant.

IMPURITIES

- A. (3*R*,5*R*)-7-[(1*S*,2*S*,6*R*,8*S*,8*aR*)-8-[(2,2-dimethylbutanoyl)oxy]-2,6-dimethyl-1,2,6,7,8,8*a*-hexahydronaphthalen-1-yl]-3,5-dihydroxyheptanoic acid (hydroxy acid),

- B. (1*S*,3*R*,7*S*,8*S*,8*aR*)-8-[2-[(2*R*,4*R*)-4-(acetyloxy)-6-oxotetrahydro-2*H*-pyran-2-yl]ethyl]-3,7-dimethyl-1,2,3,7,8,8*a*-hexahydronaphthalen-1-yl 2,2-dimethylbutanoate (acetate ester),

- C. (1*S*,3*R*,7*S*,8*S*,8*aR*)-3,7-dimethyl-8-[2-[(2*R*)-6-oxo-3,6-dihydro-2*H*-pyran-2-yl]ethyl]-1,2,3,7,8,8*a*-hexahydronaphthalen-1-yl 2,2-dimethylbutanoate (anhydrosimvastatin),

- D. (2*R*,4*R*)-2-[(1*S*,2*S*,6*R*,8*S*,8*aR*)-8-[(2,2-dimethylbutanoyl)oxy]-2,6-dimethyl-1,2,6,7,8,8*a*-hexahydronaphthalen-1-yl]ethyl]-6-oxotetrahydro-2*H*-pyran-4-yl (3*R*,5*R*)-7-[(1*S*,2*S*,6*R*,8*S*,8*aR*)-8-[(2,2-dimethylbutanoyl)oxy]-2,6-dimethyl-1,2,6,7,8,8*a*-hexahydronaphthalen-1-yl]-3,5-dihydroxyheptanoate (dimer),

- E. R1 = CH₃, R2 = H: (1*S*,3*R*,7*S*,8*S*,8*aR*)-8-[2-[(2*R*,4*R*)-4-hydroxy-6-oxotetrahydro-2*H*-pyran-2-yl]ethyl]-3,7-dimethyl-1,2,3,7,8,8*a*-hexahydronaphthalen-1-yl (2*S*)-2-methylbutanoate (lovastatin),
- F. R1 = H, R2 = CH₃: (1*S*,3*R*,7*S*,8*S*,8*aR*)-8-[2-[(2*R*,4*R*)-4-hydroxy-6-oxotetrahydro-2*H*-pyran-2-yl]ethyl]-3,7-dimethyl-1,2,3,7,8,8*a*-hexahydronaphthalen-1-yl (2*R*)-2-methylbutanoate (epilovastatin),

- G. (1*S*,7*S*,8*S*,8*aR*)-8-[2-[(2*R*,4*R*)-4-hydroxy-6-oxotetrahydro-2*H*-pyran-2-yl]ethyl]-7-methyl-3-methylene-1,2,3,7,8,8*a*-hexahydronaphthalen-1-yl 2,2-dimethylbutanoate.

01/2005:0411

SODIUM ACETATE TRIHYDRATE

Natrii acetat trihydricus

C₂H₃NaO₂·3H₂OM_r 136.1

DEFINITION

Sodium ethanoate trihydrate.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: colourless crystals.*Solubility*: very soluble in water, soluble in alcohol.

IDENTIFICATION

- A. 1 ml of solution S (see Tests) gives reaction (b) of acetates (2.3.1).
- B. 1 ml of solution S gives reaction (a) of sodium (2.3.1).
- C. It complies with the test for loss on drying (see Tests).

TESTS

Solution S. Dissolve 10.0 g in carbon dioxide-free water *R* prepared from distilled water *R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, Method II).

pH (2.2.3): 7.5 to 9.0.

Dilute 5 ml of solution S to 10 ml with *carbon dioxide-free water R*.

Reducing substances. Dissolve 1.0 g in 100 ml of boiling *water R*, add 5 ml of *dilute sulphuric acid R* and 0.5 ml of 0.002 M *potassium permanganate*, mix and boil gently for 5 min. The pink colour is not completely discharged.

Chlorides (2.4.4): maximum 200 ppm.

2.5 ml of solution S diluted to 15 ml with *water R* complies with the limit test for chlorides.

Sulphates (2.4.13): maximum 200 ppm.

7.5 ml of solution S diluted to 15 ml with *distilled water R* complies with the limit test for sulphates.

Aluminium (2.4.17): maximum 0.2 ppm, if intended for use in the manufacture of dialysis solutions.

Dissolve 20 g in 100 ml of *water R* and adjust to pH 6.0 by the addition of 1 M *hydrochloric acid* (about 10 ml). The solution complies with the limit test for aluminium. Use as the reference solution a mixture of 2 ml of *aluminium standard solution* (2 ppm Al) *R*, 10 ml of *acetate buffer solution pH 6.0 R* and 98 ml of *water R*. To prepare the blank, use a mixture of 10 ml of *acetate buffer solution pH 6.0 R* and 100 ml of *water R*.

Arsenic (2.4.2): maximum 2 ppm.

0.5 g complies with limit test A.

Calcium and magnesium: maximum 50 ppm, calculated as Ca.

To 200 ml of *water R* add 10 ml of *ammonium chloride buffer solution pH 10.0 R*, 0.1 g of *mordant black 11 triturate R*, 2.0 ml of 0.05 M *zinc chloride* and, dropwise, 0.02 M *sodium edetate* until the colour changes from violet to blue. Add to the solution 10.0 g of the substance to be examined and shake to dissolve. Titrate with 0.02 M *sodium edetate* until the blue colour is restored. Not more than 0.65 ml of 0.02 M *sodium edetate* is required.

Heavy metals (2.4.8): maximum 10 ppm.

12 ml of solution S complies with limit test A. Prepare the standard using *lead standard solution* (1 ppm Pb) *R*.

Iron (2.4.9): maximum 10 ppm.

10 ml of solution S complies with the limit test for iron.

Loss on drying (2.2.32): 39.0 per cent to 40.5 per cent, determined on 1.000 g by drying in an oven at 130 °C. Introduce the substance to be examined into the oven while the latter is cold.

ASSAY

Dissolve 0.250 g in 50 ml of *anhydrous acetic acid R*, add 5 ml of *acetic anhydride R*, mix and allow to stand for 30 min. Using 0.3 ml of *naphtholbenzein solution R* as indicator, titrate with 0.1 M *perchloric acid* until a green colour is obtained.

1 ml of 0.1 M *perchloric acid* is equivalent to 8.20 mg of $C_4H_{12}NNaO_7P_2 \cdot 3H_2O$.

STORAGE

In an airtight container.

LABELLING

The label states, where applicable, that the substance is suitable for use in the manufacture of dialysis solutions.

corrected

SODIUM ALENDRONATE

Natrii alendronas

$C_4H_{12}NNaO_7P_2 \cdot 3H_2O$

M_r 325.1

DEFINITION

Sodium alendronate contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of (4-amino-1-hydroxybutylidene)bisphosphonic acid monosodium salt, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, soluble in water, very slightly soluble in methanol, practically insoluble in methylene chloride.

IDENTIFICATION

A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *sodium alendronate CRS*. Examine the substances prepared as discs.

B. It gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 0.5 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution B₇ or BY₇ (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 4.0 to 5.0.

4-aminobutanoic acid. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution. Dissolve 0.10 g of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 0.10 g of 4-aminobutanoic acid *R* in *water R* and dilute to 200 ml with the same solvent.

Reference solution (b). Dilute 1 ml of reference solution (a) to 10 ml with *water R*.

Apply to the plate 5 µl of the test solution and 5 µl of reference solution (b). Allow the plate to dry in air. Develop over a path of 15 cm using a mixture of 20 volumes of *water R*, 20 volumes of *glacial acetic acid R* and 60 volumes of *butanol R*. Dry the plate in a current of warm air. Spray with *ninhydrin solution R* and heat at 100 °C to 105 °C for 15 min. Any spots corresponding to 4-aminobutanoic acid in the chromatogram obtained with the test solution are not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Phosphate and phosphite. Examine the chromatograms obtained in the assay. In the chromatogram obtained with the test solution: the area of any peak corresponding to phosphate is not greater than that of the peak due to phosphate in the chromatogram obtained with reference solution (d) (0.5 per cent); the area of any peak corresponding

to phosphite is not greater than that of the peak due to phosphite in the chromatogram obtained with reference solution (d) (0.5 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test F for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) R.

Loss on drying (2.2.32): 16.1 per cent to 17.1 per cent, determined on 1.000 g by drying in an oven at 140 °C to 145 °C.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in *water R* and dilute to 25.0 ml with the same solvent.

Reference solution (a). Dissolve 50.0 mg of *sodium alendronate CRS* in *water R* and dilute to 25.0 ml with the same solvent.

Reference solution (b). Dissolve 3.0 g of *phosphoric acid R* in *water R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 100.0 ml with *water R*.

Reference solution (c). Dissolve 2.5 g of *phosphorous acid R* in *water R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 100.0 ml with *water R*.

Reference solution (d). Mix 2.0 ml of reference solution (b) and 2.0 ml of reference solution (c) and dilute to 50.0 ml with *water R*.

The chromatographic procedure may be carried out using:

- a column 0.15 m long and 4.6 mm in internal diameter packed with *anion exchange resin R1* (7 µm),
- as mobile phase at a flow rate of 1.2 ml/min a solution of 0.2 ml of *anhydrous formic acid R* in 1000 ml of *water R*, adjusted to pH 3.5 with 2 M *sodium hydroxide solution*,
- as detector a refractometer,
- a 100 µl loop injector,

maintaining the temperature of the column at 35 °C.

Inject reference solution (a) six times. The assay is not valid unless the relative standard deviation of the peak area of sodium alendronate is at most 1.0 per cent. Inject the test solution, reference solution (a) and reference solution (d). The retention time of sodium alendronate is about 16 min and the relative retention times are: phosphate about 1.3 and phosphite about 1.6. Record the chromatograms for twice the retention time of the principal peak in the chromatogram obtained with the test solution.

Calculate the percentage content of C₄H₁₂NNaO₇P₂ from the peak areas and the declared content of *sodium alendronate CRS*.

IMPURITIES

- A. 4-aminobutanoic acid,
- B. phosphate,
- C. phosphite.

01/2005:0625

SODIUM ALGINATE

Natrii alginas

DEFINITION

Sodium alginate consists mainly of the sodium salt of alginic acid, which is a mixture of polyuronic acids [C₆H₈O₆]_n composed of residues of D-mannuronic acid and L-guluronic acid, and is obtained mainly from algae belonging to the Phaeophyceae.

CHARACTERS

A white or pale yellowish-brown powder, slowly soluble in water forming a viscous, colloidal solution, practically insoluble in alcohol.

IDENTIFICATION

- A. Dissolve 0.2 g with shaking in 20 ml of *water R*. To 5 ml of this solution add 1 ml of *calcium chloride solution R*. A voluminous gelatinous mass is formed.
- B. To 10 ml of the solution prepared in identification test A add 1 ml of *dilute sulphuric acid R*. A gelatinous mass is formed.
- C. To 5 mg add 5 ml of *water R*, 1 ml of a freshly prepared 10 g/l solution of *1,3-dihydroxynaphthalene R* in *alcohol R* and 5 ml of *hydrochloric acid R*. Boil for 3 min, cool, add 5 ml of *water R*, and shake with 15 ml of *di-isopropyl ether R*. Carry out a blank test. The upper layer obtained with the substance to be examined exhibits a deeper bluish-red colour than that obtained with the blank.
- D. It complies with the test for sulphated ash. The residue obtained, dissolved in 2 ml of *water R*, gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 0.10 g in *water R*, with constant stirring, dilute to 30 ml with the same solvent and allow to stand for 1 h.

Appearance of solution. Dilute 1 ml of solution S to 10 ml with *water R*. The solution is not more opalescent than reference suspension II (2.2.1) and not more intensely coloured than intensity 6 of the range of reference solutions of the most appropriate colour (2.2.2, *Method II*).

Chlorides. Not more than 1.0 per cent. To 2.50 g add 50 ml of *dilute nitric acid R*, shake for 1 h and dilute to 100.0 ml with *dilute nitric acid R*. Filter. To 50.0 ml of the filtrate add 10.0 ml of 0.1 M *silver nitrate* and 5 ml of *toluene R*. Titrate with 0.1 M *ammonium thiocyanate*, using 2 ml of *ferric ammonium sulphate solution R2* as indicator and shaking vigorously towards the end point.

1 ml of 0.1 M *silver nitrate* is equivalent to 3.545 mg of Cl.

Calcium. Not more than 1.5 per cent of Ca, determined by atomic absorption spectrometry (2.2.23, *Method II*).

Test solution. Dissolve 0.10 g of the substance to be examined in 50 ml of *dilute ammonia R2*, heating on a water-bath. Allow to cool and dilute to 100.0 ml with *distilled water R* (solution (a)). Dilute 3.0 ml of solution (a) to 100.0 ml with *distilled water R*.

Reference solutions. Prepare three reference solutions in the same manner as the test solution but add 0.75 ml, 1.0 ml and 1.5 ml respectively of *calcium standard solution* (100 ppm Ca) R to the 3.0 ml of solution (a).

Set the zero of the instrument using a mixture of 1.5 volumes of *dilute ammonia R2* and 98.5 volumes of *distilled water R*. Measure the absorbance at 422.7 nm using a calcium hollow-cathode lamp as source of radiation and an air-acetylene flame.

Heavy metals (2.4.8). 1.0 g complies with the limit test F for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 15.0 per cent, determined on 0.1000 g by drying in an oven at 100 °C to 105 °C for 4 h.

Sulphated ash (2.4.14): 30.0 per cent to 36.0 per cent, determined on 0.1000 g and calculated with reference to the dried substance.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10³ micro-organisms per gram, determined by plate-count. It complies with the tests for *Escherichia coli* and *Salmonella* (2.6.13).

01/2005:1150

SODIUM AMIDOTRIZOATE

Natrii amidotrizoas

C₁₁H₈I₃N₂NaO₄M_r 636

DEFINITION

Sodium amidotrizoate contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of sodium 3,5-bis(acetylamino)-2,4,6-tri-iodobenzoate, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white powder, freely soluble in water, slightly soluble in alcohol, practically insoluble in acetone. It melts at about 261 °C with decomposition.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *sodium amidotrizoate CRS*. Dry both the substance to be examined and the reference substance at 100 °C to 105 °C for 3 h.
- Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (b).
- Heat 50 mg gently in a small porcelain dish over a naked flame. Violet vapour is evolved.
- It gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 10 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Appearance of solution. Dilute 1 ml of solution S to 10 ml with *water R*. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 7.5 to 9.5.

Related substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel GF₂₅₄ plate R*. Prepare the solutions in subdued light and develop the chromatograms protected from light.

Test solution (a). Dissolve 0.50 g of the substance to be examined in a 3 per cent V/V solution of *ammonia R* in *methanol R* and dilute to 10 ml with the same solution.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with a 3 per cent V/V solution of *ammonia R* in *methanol R*.

Reference solution (a). Dilute 1 ml of test solution (b) to 50 ml with a 3 per cent V/V solution of *ammonia R* in *methanol R*.

Reference solution (b). Dissolve 50 mg of *sodium amidotrizoate CRS* in a 3 per cent V/V solution of *ammonia R* in *methanol R* and dilute to 10 ml with the same solution.

Apply separately to the plate 2 µl of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of *anhydrous formic acid R*, 25 volumes of *methyl ethyl ketone R* and 60 volumes of *toluene R*. Allow the plate to dry until the solvents have evaporated and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.2 per cent).

Free aromatic amines. Maintain the solutions and reagents in iced water, protected from light. To 0.50 g in a 50 ml volumetric flask add 15 ml of *water R*. Shake and add 1 ml of *dilute sodium hydroxide solution R*. Cool in iced water, add 5 ml of a freshly prepared 5 g/l solution of *sodium nitrite R* and 12 ml of *dilute hydrochloric acid R*. Shake gently and allow to stand for exactly 2 min after adding the hydrochloric acid. Add 10 ml of a 20 g/l solution of *ammonium sulphamate R*. Allow to stand for 5 min, shaking frequently, and add 0.15 ml of a 100 g/l solution of *α-naphthol R* in *alcohol R*. Shake and allow to stand for 5 min. Add 3.5 ml of *buffer solution pH 10.9 R*, mix and dilute to 50.0 ml with *water R*. The absorbance (2.2.25), measured within 20 min at 485 nm using as the compensation liquid a solution prepared at the same time and in the same manner but omitting the substance to be examined, is not greater than 0.30.

Free iodine and iodides. Not more than 50 ppm. Dissolve 1.0 g in *distilled water R* and dilute to 10 ml with the same solvent. Add dropwise *dilute nitric acid R* until the precipitation is complete, then add 3 ml of *dilute nitric acid R*. Filter and wash the precipitate with 5 ml of *water R*. Collect the filtrate and washings. Add 1 ml of *strong hydrogen peroxide solution R* and 1 ml of *methylene chloride R*. Shake. The lower layer is not more intensely coloured than a reference solution prepared simultaneously and in the same manner, using a mixture of 5 ml of *iodide standard solution (10 ppm I) R*, 3 ml of *dilute nitric acid R* and 15 ml of *water R*.

Heavy metals (2.4.8). Dilute 4 ml of solution S to 20 ml with *water R*. 12 ml of this solution complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (2 ppm Pb) R*.

Water (2.5.12). Not more than 11.0 per cent, determined on 0.400 g by the semi-micro determination of water.

ASSAY

To 0.150 g in a 250 ml round-bottomed flask add 5 ml of *strong sodium hydroxide solution R*, 20 ml of *water R*, 1 g of *zinc powder R* and a few glass beads. Boil under a reflux condenser for 30 min. Allow to cool and rinse the condenser with 20 ml of *water R*, adding the rinsings to the flask. Filter through a sintered-glass filter and wash the filter with several quantities of *water R*. Collect the filtrate and washings. Add 40 ml of *dilute sulphuric acid R* and titrate immediately with 0.1 M *silver nitrate*. Determine the end-point potentiometrically (2.2.20), using a suitable electrode system such as silver-mercurous sulphate.

1 ml of 0.1 M *silver nitrate* is equivalent to 21.20 mg of $C_{11}H_8I_3N_2NaO_4$.

STORAGE

Store protected from light.

IMPURITIES

- A. $R_1 = NH_2$, $R_2 = I$: 3-acetylamino-5-amino-2,4,6-tri-iodobenzoic acid,
 B. $R_1 = NHCOCH_3$, $R_2 = H$: 3,5-bis(acetylamino)-2,4-di-iodobenzoic acid.

01/2005:1993

SODIUM AMINOSALICYLATE
DIHYDRATE

Natrii aminosalicylas dihydricus

 $C_7H_6NNaO_3 \cdot 2H_2O$ M_r 211.2

DEFINITION

Sodium 4-amino-2-hydroxybenzoate dihydrate.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white, crystalline powder or white or almost white crystals, slightly hygroscopic.

Solubility: freely soluble in water, sparingly soluble in alcohol, practically insoluble in methylene chloride.

IDENTIFICATION

First identification: A, E.

Second identification: B, C, D, E.

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of sodium aminosalicylate dihydrate.

B. Introduce 0.3 g into a porcelain crucible. Cautiously heat on a small flame until vapour is evolved. Cover the crucible with a watch glass and collect the white sublimate. The melting point (2.2.14) of the sublimate is 120 °C to 124 °C.

C. To 0.1 ml of solution S (see Tests) add 5 ml of *water R* and 0.1 ml of *ferric chloride solution R1*. A reddish-brown colour develops.

D. 2 ml of solution S gives the reaction of primary aromatic amines (2.3.1).

E. 0.5 ml of solution S gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 0.50 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent.

Appearance of solution. The freshly prepared solution is clear (2.2.1) and not more intensely coloured than reference solution B₅ (2.2.2, *Method II*).

Dissolve 2.5 g in *water R* and dilute to 25 ml with the same solvent.

pH (2.2.3): 6.5 to 8.5 for solution S.

Related substances. Liquid chromatography (2.2.29). Use freshly prepared solutions and mobile phases.

Test solution. Dissolve 50.0 mg of the substance to be examined in *water R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dissolve 5.0 mg of 3-aminophenol R in *water R* and dilute to 100.0 ml with the same solvent.

Reference solution (b). Dissolve 5.0 mg of mesalazine CRS in *water R* and dilute to 100.0 ml with the same solvent. To 10.0 ml of this solution add 1.0 ml of reference solution (a) and dilute to 50.0 ml with *water R*.

Column:

- *size*: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- *stationary phase*: spherical base-deactivated octylsilyl silica gel for chromatography R (5 μ m).

Mobile phase:

- *mobile phase A*: dissolve 2.2 g of *perchloric acid R* and 1.0 g of *phosphoric acid R* in *water R* and dilute to 1000.0 ml with the same solvent,
- *mobile phase B*: dissolve 1.7 g of *perchloric acid R* and 1.0 g of *phosphoric acid R* in *acetonitrile R* and dilute to 1000.0 ml with the same solvent,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 15	100	0
15 - 30	100 → 40	0 → 60
30 - 35	40 → 100	60 → 0
35 - 45	100	0

Flow rate: 1.25 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 10 μ l.

Relative retention with reference to 4-aminosalicylate (retention time = about 12 min): impurity A = about 0.30; impurity B = about 0.37.

System suitability: reference solution (b):

- *resolution*: minimum 4.0 between the peaks due to impurity A and impurity B.

Limits:

- *impurity A*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- *impurity B*: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (1.0 per cent),

- *any other impurity*: for each impurity, not more than 0.1 times the area of the peak due to impurity B in the chromatogram obtained with reference solution (b) (0.1 per cent),
- *total*: not more than the area of the peak due to impurity B in the chromatogram obtained with reference solution (b) (1.0 per cent),
- *disregard limit*: 0.05 times the area of the peak due to impurity B in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.4.8): maximum 10 ppm.

2.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) R.

Loss on drying (2.2.32): 16.0 per cent to 17.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Pyrogens (2.6.8). If intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of pyrogens, it complies with the test for pyrogens. Inject per kilogram of the rabbit's mass, 10 ml of a 20 mg/ml solution of the substance to be examined in *water for injections* R.

ASSAY

Dissolve 0.150 g in 20 ml of *water* R. Add 10 ml of a 500 g/l solution of *sodium bromide* R and 25 ml of *glacial acetic acid* R. Add 5 ml of 0.1 M *sodium nitrite* rapidly and continue the titration with the same titrant, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *sodium nitrite* is equivalent to 17.52 mg of $C_7H_6NNaO_3$.

STORAGE

In an airtight container, protected from light. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is apyrogenic.

IMPURITIES

Specified impurities: A, B.

A. R1 = R3 = H, R2 = NH₂: 3-aminophenol,

B. R1 = CO₂H, R2 = H, R3 = NH₂: 5-amino-2-hydroxybenzoic acid (mesalazine).

01/2005:1791

SODIUM ASCORBATE

Natrii ascorbas

$C_6H_7NaO_6$

M_r 198.1

DEFINITION

Sodium (2*R*)-2-[(1*S*)-1,2-dihydroxyethyl]-4-hydroxy-5-oxo-2,5-dihydrofuran-3-olate.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or yellowish, crystalline powder or crystals.

Solubility: freely soluble in water, sparingly soluble in alcohol, practically insoluble in methylene chloride.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. Specific optical rotation (2.2.7) (see Tests).

B. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: *sodium ascorbate CRS*.

C. To 1 ml of solution S (see Tests) add 0.2 ml of *dilute nitric acid* R and 0.2 ml of *silver nitrate solution* R2. A grey precipitate is formed.

D. 1 ml of solution S gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water* R prepared from *distilled water* R and dilute to 100.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₆ or BY₆ (2.2.2, *Method II*). Examine the colour immediately after preparation of the solution.

pH (2.2.3): 7.0 to 8.0 for solution S.

Specific optical rotation (2.2.7): + 103 to + 108 (dried substance), determined on freshly prepared solution S.

Oxalic acid: maximum 0.3 per cent.

Test solution. Dissolve 0.25 g in 5 ml of *water* R. Add 1 ml of *dilute acetic acid* R and 0.5 ml of *calcium chloride solution* R.

Reference solution. Dissolve 70 mg of *oxalic acid* R in *water* R and dilute to 500 ml with the same solvent; to 5 ml of the solution add 1 ml of *dilute acetic acid* R and 0.5 ml of *calcium chloride solution* R.

Allow the solutions to stand for 1 h. Any opalescence in the test solution is not more intense than that in the reference solution.

Benzene (2.4.24, *System A*): maximum 2 ppm.

Sulphates (2.4.13): maximum 150 ppm.

To 10 ml of solution S add 2 ml of *hydrochloric acid* R1 and dilute to 15 ml with *distilled water* R. The solution complies with the limit test for sulphates.

Copper: maximum 5 ppm.

Atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dissolve 2.0 g in 0.1 M *nitric acid* and dilute to 25.0 ml with the same solvent.

Reference solutions. Prepare reference solutions (0.2 ppm, 0.4 ppm and 0.6 ppm) by diluting *copper standard solution* (10 ppm Cu) R with 0.1 M *nitric acid*.

Source: copper hollow-cathode lamp.

Wavelength: 324.8 nm.

Flame: air-acetylene.

Iron: maximum 2 ppm.

Atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dissolve 5.0 g in 0.1 M *nitric acid* and dilute to 25.0 ml with the same solvent.

Reference solutions. Prepare reference solutions (0.2 ppm, 0.4 ppm and 0.6 ppm) by diluting *iron standard solution* (20 ppm Fe) *R* with 0.1 M nitric acid.

Source: iron hollow-cathode lamp.

Wavelength: 248.3 nm.

Flame: air-acetylene.

Nickel: maximum 1 ppm.

Atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dissolve 10.0 g in 0.1 M nitric acid and dilute to 25.0 ml with the same solvent.

Reference solutions. Prepare reference solutions (0.2 ppm, 0.4 ppm and 0.6 ppm) by diluting *nickel standard solution* (10 ppm Ni) *R* with 0.1 M nitric acid.

Source: nickel hollow-cathode lamp.

Wavelength: 232.0 nm.

Flame: air-acetylene.

Heavy metals (2.4.8): maximum 10 ppm.

Dissolve 2.0 g in *water R* and dilute to 20 ml with the same solvent. 12 ml of the solution complies with limit test A.

Prepare the standard using *lead standard solution* (1 ppm Pb) *R*.

Loss on drying (2.2.32): maximum 0.25 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

ASSAY

Dissolve 80 mg in a mixture of 10 ml of *dilute sulphuric acid R* and 80 ml of *carbon dioxide-free water R*. Add 1 ml of *starch solution R*. Titrate with 0.05 M iodine until a persistent violet-blue colour is obtained.

1 ml of 0.05 M iodine is equivalent to 9.91 mg of C₆H₅NaO₂.

STORAGE

Non-metallic container, protected from light.

01/2005:0123

SODIUM BENZOATE

Natrii benzoas

C₇H₅NaO₂

*M*_r 144.1

DEFINITION

Sodium benzoate contains not less than 99.0 per cent and not more than the equivalent of 100.5 per cent of sodium benzenecarboxylate, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline or granular powder or flakes, slightly hygroscopic, freely soluble in water, sparingly soluble in alcohol (90 per cent V/V).

IDENTIFICATION

- A. It gives reactions (b) and (c) of benzoates (2.3.1).
- B. It gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of solution S add 10 ml of *carbon dioxide-free water R* and 0.2 ml of *phenolphthalein solution R*. Not more than 0.2 ml of 0.1 M sodium hydroxide or 0.1 M hydrochloric acid is required to change the colour of the indicator.

Halogenated compounds. All glassware used must be chloride-free and may be prepared by soaking overnight in a 500 g/l solution of nitric acid *R*, rinsed with *water R* and stored full of *water R*. It is recommended that glassware be reserved exclusively for this test.

To 20.0 ml of solution S add 5 ml of *water R* and dilute to 50.0 ml with *alcohol R* (test solution).

Determination of ionised chlorine. In three 25 ml volumetric flasks, prepare the following solutions.

Solution (a). To 4.0 ml of the test solution add 3 ml of *dilute sodium hydroxide solution R* and 3 ml of *alcohol R*. This solution is used to prepare solution A.

Solution (b). To 3 ml of *dilute sodium hydroxide solution R* add 2 ml of *water R* and 5 ml of *alcohol R*. This solution is used to prepare solution B.

Solution (c). To 4.0 ml of *chloride standard solution* (8 ppm Cl) *R* add 6.0 ml of *water R*. This solution is used to prepare solution C.

In a fourth 25 ml volumetric flask, place 10 ml of *water R*. To each flask add 5 ml of *ferric ammonium sulphate solution R5*, mix and add dropwise and with swirling 2 ml of *nitric acid R* and 5 ml of *mercuric thiocyanate solution R*. Shake. Dilute the contents of each flask to 25.0 ml with *water R* and allow the solutions to stand in a water-bath at 20 °C for 15 min. Measure at 460 nm in a 2 cm cell the absorbance (2.2.25) of solution A using solution B as the compensation liquid, and the absorbance of solution C using the solution obtained with 10 ml of *water R* as the compensation liquid. The absorbance of solution A is not greater than that of solution C (200 ppm).

Determination of total chlorine

Solution (a). To 10.0 ml of the test solution add 7.5 ml of *dilute sodium hydroxide solution R* and 0.125 g of *nickel-aluminium alloy R* and heat on a water-bath for 10 min. Allow to cool to room temperature, filter into a 25 ml volumetric flask and wash the filter with 3 quantities, each of 2 ml, of *alcohol R* (a slight precipitate may form that disappears on acidification). Dilute the filtrate and washings to 25.0 ml with *water R*. This solution is used to prepare solution A.

Solution (b). In the same manner, prepare a similar solution replacing the test solution by a mixture of 5 ml of *alcohol R* and 5 ml of *water R*. This solution is used to prepare solution B.

Solution (c). To 6.0 ml of *chloride standard solution* (8 ppm Cl) *R* add 4.0 ml of *water R*. This solution is used to prepare solution C.

In four 25 ml volumetric flasks, place separately 10 ml of solution (a), 10 ml of solution (b), 10 ml of solution (c) and 10 ml of *water R*. To each flask add 5 ml of *ferric ammonium sulphate solution R5*, mix and add dropwise and with swirling 2 ml of *nitric acid R* and 5 ml of *mercuric thiocyanate solution R*. Shake. Dilute the contents of each flask to 25.0 ml with *water R* and allow the solutions to stand in a water-bath at 20 °C for 15 min. Measure at 460 nm in a 2 cm cell the absorbance (2.2.25) of solution A using solution B as the compensation liquid, and the absorbance of

solution C using the solution obtained with 10 ml of *water R* as the compensation liquid. The absorbance of solution A is not greater than that of solution C (300 ppm).

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 2.0 per cent, determined on 1.00 g by drying in an oven at 100 °C to 105 °C.

ASSAY

Dissolve 0.250 g in 20 ml of *anhydrous acetic acid R*, heating to 50 °C if necessary. Cool. Using 0.05 ml of *naphtholbenzein solution R* as indicator, titrate with 0.1 M *perchloric acid* until a green colour is obtained.

1 ml of 0.1 M *perchloric acid* is equivalent to 14.41 mg of $C_7H_5NaO_2$.

01/2005:0190

SODIUM BROMIDE

Natrii bromidum

NaBr

 M_r 102.9

DEFINITION

Content: 98.0 per cent to 100.5 per cent (dried substance).

CHARACTERS

Appearance: white, granular powder or small, colourless, transparent or opaque crystals, slightly hygroscopic.

Solubility: freely soluble in water, soluble in alcohol.

IDENTIFICATION

- It gives reaction (a) of bromides (2.3.1).
- Solution S (see Tests) gives the reactions of sodium (2.3.1).

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.5 ml of 0.01 M *hydrochloric acid* or 0.01 M *sodium hydroxide* is required to change the colour of the indicator.

Bromates. To 10 ml of solution S add 1 ml of *starch solution R*, 0.1 ml of a 100 g/l solution of *potassium iodide R* and 0.25 ml of 0.5 M *sulphuric acid* and allow to stand protected from light for 5 min. No blue or violet colour develops.

Chlorides: maximum 0.6 per cent.

In a conical flask, dissolve 1.000 g in 20 ml of *dilute nitric acid R*. Add 5 ml of *strong hydrogen peroxide solution R* and heat on a water-bath until the solution is completely decolourised. Wash down the sides of the flask with a little *water R* and heat on a water-bath for 15 min. Allow to cool, dilute to 50 ml with *water R* and add 5.0 ml of 0.1 M *silver nitrate* and 1 ml of *dibutyl phthalate R*. Shake and titrate with 0.1 M *ammonium thiocyanate*, using 5 ml of *ferric ammonium sulphate solution R2* as indicator. Not more than 1.7 ml of 0.1 M *silver nitrate* is used. Note the volume of 0.1 M *silver nitrate* used (see Assay). Carry out a blank test.

Iodides. To 5 ml of solution S add 0.15 ml of *ferric chloride solution R1* and 2 ml of *methylen chloride R*. Shake and allow to separate. The lower layer is colourless (2.2.2, *Method I*).

Sulphates (2.4.13): maximum 100 ppm.

15 ml of solution S complies with the limit test for sulphates.

Iron (2.4.9): maximum 20 ppm.

5 ml of solution S diluted to 10 ml with *water R* complies with the limit test for iron.

Magnesium and alkaline-earth metals (2.4.7): maximum 200 ppm, calculated as Ca.

10.0 g complies with the limit test for magnesium and alkaline-earth metals. The volume of 0.01 M *sodium edetate* used does not exceed 5.0 ml.

Heavy metals (2.4.8): maximum 10 ppm.

12 ml of solution S complies with limit test A. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32): maximum 3.0 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 3 h.

ASSAY

Dissolve 2.000 g in *water R* and dilute to 100.0 ml with the same solvent. To 10.0 ml of the solution add 50 ml of *water R*, 5 ml of *dilute nitric acid R*, 25.0 ml of 0.1 M *silver nitrate* and 2 ml of *dibutyl phthalate R*. Shake. Titrate with 0.1 M *ammonium thiocyanate*, using 2 ml of *ferric ammonium sulphate solution R2* as indicator and shaking vigorously towards the end-point.

1 ml of 0.1 M *silver nitrate* is equivalent to 10.29 mg of NaBr. Calculate the percentage content of NaBr from the expression:

$$a - 2.902 b$$

a = percentage content of NaBr and NaCl obtained in the assay and calculated as NaBr,

b = percentage content of Cl in the test for chlorides.

STORAGE

In an airtight container.

01/2005:0231

SODIUM CALCIUM EDETATE

Natrii calcii edetas

$C_{10}H_{12}CaN_2Na_2O_{16} \cdot xH_2O$ M_r 374.3 (anhydrous substance)

DEFINITION

Disodium [(ethylenedinitrilo)tetraacetato]calciate(2-).

Content: 98.0 per cent to 102.0 per cent (anhydrous substance).

It contains a variable amount of water of crystallisation.

CHARACTERS

Appearance: white or almost white powder, hygroscopic.

Solubility: freely soluble in water, practically insoluble in alcohol.

IDENTIFICATION

First identification: A, C, D.

Second identification: B, C, D.

A. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: sodium calcium edetate CRS.

B. Dissolve 2 g in 10 ml of *water R*, add 6 ml of *lead nitrate solution R*, shake and add 3 ml of *potassium iodide solution R*. No yellow precipitate is formed. Make alkaline to *red litmus paper R* by the addition of *dilute ammonia R2* and add 3 ml of *ammonium oxalate solution R*. A white precipitate is formed.

C. Ignite. The residue gives the reactions of calcium (2.3.1).

D. The residue obtained in identification test C gives the reactions of sodium (2.3.1).

TESTS

Solution S. Dissolve 5.0 g in *water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3): 6.5 to 8.0.

Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent.

Impurity A. Liquid chromatography (2.2.29). Carry out the test protected from light.

Solvent mixture. Dissolve 10.0 g of *ferric sulphate pentahydrate R* in 20 ml of *0.5 M sulphuric acid* and add 780 ml of *water R*. Adjust to pH 2.0 with *1 M sodium hydroxide* and dilute to 1000 ml with *water R*.

Test solution. Dissolve 0.100 g of the substance to be examined in the solvent mixture and dilute to 25.0 ml with the solvent mixture.

Reference solution. Dissolve 40.0 mg of *nitrilotriacetic acid R* in the solvent mixture and dilute to 100.0 ml with the solvent mixture. To 1.0 ml of the solution add 0.1 ml of the test solution and dilute to 100.0 ml with the solvent mixture.

Column:

- size: $l = 0.10$ m, $\varnothing = 4.6$ mm,
- stationary phase: spherical graphitised carbon for chromatography R1 (5 μ m) with a specific surface area of 120 m²/g and a pore size of 25 nm.

Mobile phase: dissolve 50.0 mg of *ferric sulphate pentahydrate R* in 50 ml of *0.5 M sulphuric acid* and add 750 ml of *water R*. Adjust to pH 1.5 with *0.5 M sulphuric acid* or *1 M sodium hydroxide*, add 20 ml of *ethylene glycol R* and dilute to 1000 ml with *water R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 273 nm.

Injection: 20 μ l; filter the solutions and inject immediately.

Run time: 4 times the retention time of the iron complex of impurity A.

Retention time: iron complex of impurity A = about 5 min; iron complex of edetic acid = about 10 min.

System suitability: reference solution:

- resolution: minimum 7 between the peaks due to the iron complex of impurity A and the iron complex of edetic acid,
- signal-to-noise ratio: minimum 50 for the peak due to impurity A.

Limit:

- impurity A: not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.1 per cent).

Disodium edetate: maximum 1.0 per cent.

Dissolve 5.0 g in 250 ml of *water R*. Add 10 ml of *ammonium chloride buffer solution pH 10.0 R* and about 50 mg of *mordant black 11 triturate R*. Not more than 1.5 ml of *0.1 M magnesium chloride* is required to change the colour of the indicator to violet.

Chlorides (2.4.4): maximum 0.1 per cent.

To 20 ml of solution S add 30 ml of *dilute nitric acid R*, allow to stand for 30 min and filter. Dilute 2.5 ml of the filtrate to 15 ml with *water R*.

Iron (2.4.9): maximum 80 ppm.

Dilute 2.5 ml of solution S to 10 ml with *water R*. Add 0.25 g of *calcium chloride R* to the test solution and the standard before the addition of the *thioglycollic acid R*.

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test D. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (2.5.12, *Method B*): 5.0 per cent to 13.0 per cent, determined on 0.100 g.

ASSAY

Dissolve 0.300 g in *water R* and dilute to 300 ml with the same solvent. Add 2 g of *hexamethylenetetramine R* and 2 ml of *dilute hydrochloric acid R*. Titrate with *0.1 M lead nitrate*, using about 50 mg of *xylene orange triturate R* as indicator.

1 ml of *0.1 M lead nitrate* is equivalent to 37.43 mg of $C_{10}H_{12}CaN_2Na_2O_8$.

STORAGE

In an airtight container, protected from light.

IMPURITIES

Specified impurities: A.

A. nitrilotriacetic acid.

01/2005:1471

SODIUM CAPRYLATE

Natrii caprylas

$C_8H_{15}NaO_2$

M_r 166.2

DEFINITION

Sodium caprylate contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of sodium octanoate, calculated with reference to the anhydrous substance.

CHARACTERS

A white, crystalline powder, very soluble or freely soluble in water, freely soluble in acetic acid, sparingly soluble in alcohol, practically insoluble in acetone.

IDENTIFICATION

A. Examine the chromatograms obtained in the test for related substances. The retention time and size of the principal peak in the chromatogram obtained with the

test solution are approximately the same as those of the principal peak in the chromatogram obtained with reference solution (a).

- B. To 0.2 ml of solution S (see Tests) add 0.3 ml of *water R*. The solution gives reaction (b) of sodium (2.3.1).

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 8.0 to 10.5.

Related substances. Examine by gas chromatography (2.2.28).

Test solution. Dissolve 0.116 g in *water R* and dilute to 5 ml with the same solvent. Add 1 ml of a 2.8 per cent V/V solution of *sulphuric acid R* and shake with 10 ml of *ethyl acetate R*. Separate the organic layer and dry over *anhydrous sodium sulphate R*.

Reference solution (a). Dissolve 0.10 g of *caprylic acid CRS* in *ethyl acetate R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 1 ml of the test solution to 100 ml with *ethyl acetate R*. Dilute 5 ml of the solution to 50 ml with *ethyl acetate R*.

The chromatographic procedure may be carried out using:

- a fused-silica column 30 m long and 0.25 mm in internal diameter coated with *macrogol 20 000 2-nitroterephthalate R* (film thickness 0.25 µm),
- *helium for chromatography R* as the carrier gas at a flow rate of 1.5 ml/min,
- a flame-ionisation detector,
- a split ratio of 1:100,

with the following temperature programme:

	Time (min)	Temperature (°C)	Rate (°C/min)	Comment
Column	0 - 1	100		isothermal
	1 - 25	100 → 220	5	linear gradient
	25 - 35	220		isothermal
Injection port		250		
Detector		250		

Inject 1 µl of reference solution (b). The test is not valid unless in the chromatogram obtained the principal peak has a signal-to-noise ratio of at least 5.

Inject 1 µl of the test solution and 1 µl of reference solution (a). Calculate the percentage of related substances from the areas of the peaks in the chromatogram obtained with the test solution by the normalisation procedure, disregarding any peaks with an area less than 0.5 times the area of the peak in the chromatogram obtained with reference solution (b) and any peak due to the solvent. The content of any related substance is not greater than 0.3 per cent and the sum of the related substances is not greater than 0.5 per cent.

Heavy metals (2.4.8). Dissolve 2.0 g in *glacial acetic acid R* and dilute to 10 ml with the same acid. Add 10 ml of *alcohol R*. 12 ml of the solution complies with limit test B for heavy metals (10 ppm). Prepare the standard using 1 ml of *lead standard solution (10 ppm Pb) R* and 9 ml of a mixture of equal volumes of *glacial acetic acid R* and *alcohol R*.

Water (2.5.12). Not more than 3.0 per cent, determined on 1.000 g by the semi-micro determination of water.

ASSAY

Dissolve 0.150 g in 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M perchloric acid is equivalent to 16.62 mg of $C_8H_{15}NaO_9$.

IMPURITIES

- A. $n = 4$: hexanoic acid,
B. $n = 5$: heptanoic acid,
C. $n = 7$: nonanoic acid,
D. $n = 8$: decanoic acid,
E. valproic acid.

- F. $R = \text{OCH}_3$, $n = 6$: methyl octanoate,
G. $R = \text{OC}_2\text{H}_5$, $n = 6$: ethyl octanoate,
H. $R = \text{OCH}_3$, $n = 8$: methyl decanoate,
I. $R = \text{CH}_2$, $n = 8$: undecan-2-one.

- J. (*RS*)-5-butyltetrahydrofuran-2-one (γ -hydroxyoctanoic acid lactone).

01/2005:0773

SODIUM CARBONATE, ANHYDROUS

Natrii carbonas anhydricus

 M_r 106.0

DEFINITION

Anhydrous sodium carbonate contains not less than 99.5 per cent and not more than the equivalent of 100.5 per cent of Na_2CO_3 , calculated with reference to the dried substance.

CHARACTERS

A white or almost white, slightly granular powder, hygroscopic, freely soluble in water, practically insoluble in alcohol.

IDENTIFICATION

- A. Dissolve 1 g in *water R* and dilute to 10 ml with the same solvent. The solution is strongly alkaline (2.2.4).
- B. The solution prepared for identification test A gives the reaction of carbonates (2.3.1).
- C. The solution prepared for identification test A gives reaction (a) of sodium (2.3.1).
- D. It complies with the test for loss on drying (see Tests).

TESTS

Solution S. Dissolve 2.0 g in portions in a mixture of 5 ml of *hydrochloric acid R* and 25 ml of *distilled water R*. Heat the solution to boiling and cool. Add *dilute sodium hydroxide solution R* until the solution is neutral and dilute to 50 ml with *distilled water R*.

Appearance of solution. Dissolve 2.0 g in 10 ml of *water R*. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, *Method I*).

Alkali hydroxides and bicarbonates. Dissolve 0.4 g in 20 ml of *water R*. Add 20 ml of *barium chloride solution R1* and filter. To 10 ml of the filtrate add 0.1 ml of *phenolphthalein solution R*. The solution does not become red. Boil the remainder of the filtrate for 2 min. The solution remains clear (2.2.1).

Chlorides (2.4.4). Dissolve 0.4 g in *water R*, add 4 ml of *dilute nitric acid R* and dilute to 15 ml with *water R*. The solution complies with the limit test for chlorides (125 ppm).

Sulphates (2.4.13). 15 ml of solution S complies with the limit test for sulphates (250 ppm).

Arsenic (2.4.2). 5 ml of solution S complies with limit test A for arsenic (5 ppm).

Iron (2.4.9). Dilute 5 ml of solution S to 10 ml with *water R*. The solution complies with the limit test for iron (50 ppm).

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (50 ppm). Prepare the standard using *lead standard solution (2 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying at 300 °C.

ASSAY

Dissolve 1.000 g in 25 ml of *water R*. Add 0.2 ml of *methyl orange solution R* as indicator. Titrate with 1 M *hydrochloric acid* until the colour changes from yellow to red.

1 ml of 1 M *hydrochloric acid* is equivalent to 52.99 mg of Na₂CO₃.

STORAGE

Store in an airtight container.

Appearance of solution. Dissolve 4.0 g in 10 ml of *water R*. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, *Method I*).

Alkali hydroxides and bicarbonates. Dissolve 1.0 g in 20 ml of *water R* add 20 ml of *barium chloride solution R1* and filter. To 10 ml of the filtrate add 0.1 ml of *phenolphthalein solution R*. The solution does not become red. Heat the remainder of the filtrate to boiling for 2 min. The solution remains clear (2.2.1).

Chlorides (2.4.4). Dissolve 1.0 g in *water R*, add 4 ml of *dilute nitric acid R* and dilute to 15 ml with *water R*. The solution complies with the limit test for chlorides (50 ppm).

Sulphates (2.4.13). 15 ml of solution S complies with the limit test for sulphates (100 ppm).

Arsenic (2.4.2). 5 ml of solution S complies with limit test A for arsenic (2 ppm).

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (2 ppm Pb) R*.

Iron (2.4.9). 5 ml of solution S diluted to 10 ml with *water R* complies with the limit test for iron (20 ppm).

ASSAY

Dissolve 2.000 g in 25 ml of *water R*. Titrate with 1 M *hydrochloric acid*, using 0.2 ml of *methyl orange solution R* as indicator.

1 ml of 1 M *hydrochloric acid* is equivalent to 52.99 mg of Na₂CO₃.

STORAGE

Store in an airtight container.

01/2005:0192

01/2005:0191

SODIUM CARBONATE DECAHYDRATE

Natrii carbonas decahydricus

Na₂CO₃·10H₂O *M_r* 286.1

DEFINITION

Sodium carbonate decahydrate contains not less than 36.7 per cent and not more than the equivalent of 40.0 per cent of Na₂CO₃.

CHARACTERS

A white, crystalline powder or colourless, transparent crystals, efflorescent, freely soluble in water, practically insoluble in alcohol.

IDENTIFICATION

- Dissolve 1 g in *water R* and dilute to 10 ml with the same solvent. The solution is strongly alkaline (2.2.4).
- The solution prepared for identification test A gives the reaction of carbonates (2.3.1).
- The solution prepared for identification test A gives the reactions of sodium (2.3.1).

TESTS

Solution S. Dissolve 5.0 g in portions in a mixture of 5 ml of *hydrochloric acid R* and 25 ml of *distilled water R*. Heat the solution to boiling and cool. Add *dilute sodium hydroxide solution R* until the solution is neutral and dilute to 50 ml with *distilled water R*.

SODIUM CARBONATE MONOHYDRATE

Natrii carbonas monohydricus

Na₂CO₃·H₂O *M_r* 124.0

DEFINITION

Sodium carbonate monohydrate contains not less than 83.0 per cent and not more than the equivalent of 87.5 per cent of Na₂CO₃.

CHARACTERS

A white, crystalline powder or colourless crystals, freely soluble in water, practically insoluble in alcohol.

IDENTIFICATION

- Dissolve 1 g in *water R* and dilute to 10 ml with the same solvent. The solution is strongly alkaline (2.2.4).
- The solution prepared for identification test A gives the reaction of carbonates (2.3.1).
- The solution prepared for identification test A gives the reactions of sodium (2.3.1).

TESTS

Solution S. Dissolve 2.0 g in portions in a mixture of 5 ml of *hydrochloric acid R* and 25 ml of *distilled water R*. Heat the solution to boiling and cool. Add *dilute sodium hydroxide solution R* until the solution is neutral and dilute to 50 ml with *distilled water R*.

Appearance of solution. Dissolve 2.0 g in 10 ml of *water R*. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, *Method I*).

Alkali hydroxides and bicarbonates. Dissolve 0.4 g in 20 ml of *water R*, add 20 ml of *barium chloride solution R1* and filter. To 10 ml of the filtrate add 0.1 ml of *phenolphthalein solution R*. The solution does not become red. Heat the remainder of the filtrate to boiling for 2 min. The solution remains clear (2.2.1).

Chlorides (2.4.4). Dissolve 0.4 g in *water R*, add 4 ml of *dilute nitric acid R* and dilute to 15 ml with *water R*. The solution complies with the limit test for chlorides (125 ppm).

Sulphates (2.4.13). 15 ml of solution S complies with the limit test for sulphates (250 ppm).

Arsenic (2.4.2). 5 ml of solution S complies with limit test A for arsenic (5 ppm).

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (50 ppm). Prepare the standard using *lead standard solution* (2 ppm Pb) *R*.

Iron (2.4.9). 5 ml of solution S diluted to 10 ml with *water R* complies with the limit test for iron (50 ppm).

ASSAY

Dissolve 1.000 g in 25 ml of *water R*. Titrate with 1 M *hydrochloric acid*, using 0.2 ml of *methyl orange solution R* as indicator.

1 ml of 1 M *hydrochloric acid* is equivalent to 52.99 mg of Na₂CO₃.

STORAGE

Store in an airtight container.

01/2005:0847

SODIUM CETOSTEARYL SULPHATE

Natrii cetylo- et stearylosulfas.

DEFINITION

Sodium cetostearyl sulphate is a mixture of sodium cetyl sulphate (C₁₆H₃₃NaO₄S; *M_r* 344.5) and sodium stearyl sulphate (C₁₈H₃₇NaO₄S; *M_r* 372.5). It contains not less than 90.0 per cent of sodium cetostearyl sulphate and not less than 40.0 per cent of sodium cetyl sulphate, both contents calculated with reference to the anhydrous substance. A suitable buffer may be added.

CHARACTERS

A white or pale yellow, amorphous or crystalline powder, soluble in hot water giving an opalescent solution, practically insoluble in cold water, partly soluble in alcohol.

IDENTIFICATION

First identification: B, D, F.

Second identification: A, C, D, E, F.

A. Examine by thin-layer chromatography (2.2.27), using a *TLC silanised silica gel plate R*.

Test solution. Dissolve 50 mg of the substance to be examined in 10 ml of *alcohol* (70 per cent V/V) *R*, heating on a water-bath.

Reference solution. Dissolve 50 mg of *sodium cetostearyl sulphate CRS* in 10 ml of *alcohol* (70 per cent V/V) *R*, heating on a water-bath.

Apply to the plate 2 µl of each solution. Develop over a path of 12 cm using a mixture of 20 volumes of *water R*, 40 volumes of *acetone R* and 40 volumes of *methanol R*.

Allow the plate to dry in air and spray with a 50 g/l solution of *phosphomolybdic acid R* in *alcohol R*. Heat at 120 °C until the appearance of the spots (about 3 h). The principal spots in the chromatogram obtained with the test solution are similar in position and colour to the principal spots in the chromatogram obtained with the reference solution.

- B. Examine the chromatograms obtained in the assay. The retention times of the two principal peaks in the chromatogram obtained with test solution (c) are similar to those of the two principal peaks in the chromatogram obtained with the reference solution.
- C. Dissolve 0.1 g in 10 ml of *water R* and shake. A foam is formed.
- D. It gives a yellow colour to a non-luminous flame.
- E. To 0.1 ml of the solution prepared for identification test C add 0.1 ml of a 1 g/l solution of *methylene blue R* and 2 ml of *dilute sulphuric acid R*. Add 2 ml of *methylene chloride R* and shake. The methylene chloride layer has an intense blue colour.
- F. Mix about 10 mg with 10 ml of *ethanol R*. Heat to boiling on a water-bath, shaking frequently. Filter immediately and evaporate to dryness. Dissolve the residue in 7 ml of *water R*, add 3 ml of *dilute hydrochloric acid R* and evaporate the solution to half its volume. Allow to cool. Filter. To the filtrate add 1 ml of *barium chloride solution R1*. A white, crystalline precipitate is formed.

TESTS

Acidity or alkalinity. Dissolve 0.5 g with heating in a mixture of 10 ml of *water R* and 15 ml of *alcohol* (90 per cent V/V) *R*. Add 0.1 ml of *phenolphthalein solution R1*. The solution is colourless. Add 0.1 ml of 0.1 M *sodium hydroxide*. The solution is red.

Sodium chloride and sodium sulphate. Not more than a total of 8.0 per cent.

Sodium chloride. Dissolve 5.00 g in 50 ml of *water R*, add *dilute nitric acid R* dropwise until the solution is neutral to *blue litmus paper R*. Add 2 ml of *potassium chromate solution R* and titrate with 0.1 M *silver nitrate*.

1 ml of 0.1 M *silver nitrate* is equivalent to 5.844 mg of NaCl.

Sodium sulphate. Dissolve 0.500 g in 20 ml of *water R*, warming gently if necessary, and add 1 ml of a 0.5 g/l solution of *dithizone R* in *acetone R*. If the solution is red, add 1 M *nitric acid*, dropwise, until a bluish-green colour is obtained. Add 2.0 ml of *dichloroacetic acid solution R* and 80 ml of *acetone R*. Titrate with 0.01 M *lead nitrate* until a persistent orange-red colour is obtained.

1 ml of 0.01 M *lead nitrate* is equivalent to 1.420 mg of Na₂SO₄.

Free cetostearyl alcohol. Not more than 4.0 per cent. Examine the chromatogram obtained with test solution (a) in the assay.

Calculate the percentage content of free cetostearyl alcohol in the substance to be examined, using the expression:

$$S \frac{100 \times m_H}{S_{Ha(corr)} \times m}$$

- S* = sum of the areas of the peaks corresponding to cetyl alcohol and stearyl alcohol in the chromatogram obtained with test solution (a),
- m_H* = mass of the internal standard added in the preparation of test solution (a), in milligrams,

$S_{Ha(corr)}$ = corrected area of the peak corresponding to the internal standard in the chromatogram obtained with test solution (a),

m = mass of sodium cetostearyl sulphate used for the preparation of test solution (a), in milligrams.

Water (2.5.12). Not more than 1.5 per cent, determined on 5.00 g by the semi-micro determination of water.

ASSAY

Examine by gas chromatography (2.2.28).

Internal standard solution. Dissolve 0.20 g of *heptadecanol CRS* in *ethanol R* and dilute to 50 ml with the same solvent.

Test solution (a). Dissolve 0.300 g of the substance to be examined in 50 ml of *ethanol R* and add 2 ml of the internal standard solution and 48 ml of *water R*. Shake with four quantities, each of 25 ml, of *pentane R*, adding *sodium chloride R*, if necessary, to facilitate the separation of the layers. Combine the organic layers. Reserve the hydro-alcoholic layer for the preparation of test solutions (c) and (d). Wash the organic layer with two quantities, each of 30 ml, of *water R*. Dry over *anhydrous sodium sulphate R* and filter.

Test solution (b). Dissolve 0.300 g of the substance to be examined in 50 ml of *ethanol R* and add 50 ml of *water R*. Shake with four quantities, each of 25 ml, of *pentane R*, adding *sodium chloride R*, if necessary, to facilitate the separation of the layers. Combine the organic layers, wash with two quantities, each of 30 ml, of *water R*. Dry over *anhydrous sodium sulphate R* and filter.

Test solution (c). Transfer 25 ml of the hydro-alcoholic solution obtained in the preparation of test solution (a) to a 200 ml flask that can be fitted with a reflux condenser. Add 20 ml of *hydrochloric acid R* and 10 ml of the internal standard solution. Boil under a reflux condenser for 2 h. Allow to cool and shake with four quantities, each of 20 ml, of *pentane R*. Combine the organic layers and wash with two quantities, each of 20 ml, of *water R*. Dry over *anhydrous sodium sulphate R* and filter.

Test solution (d). Transfer 25 ml of the hydro-alcoholic solution obtained in the preparation of test solution (a) to a 200 ml flask that can be fitted with a reflux condenser. Add 20 ml of *hydrochloric acid R* and 10 ml of *ethanol R*. Boil under a reflux condenser for 2 h. Allow to cool and shake with four quantities, each of 20 ml, of *pentane R*. Combine the organic layers and wash with two quantities, each of 20 ml, of *water R*. Dry over *anhydrous sodium sulphate R* and filter.

Reference solution. Dissolve 50 mg of *cetyl alcohol CRS* and 50 mg of *stearyl alcohol CRS* in *ethanol R* and dilute to 10 ml with the same solvent.

The chromatographic procedure may be carried out using:

- a fused-silica column 25 m long and 0.25 mm in internal diameter coated with *poly(dimethyl)siloxane R* or another suitable polar phase,
- *nitrogen for chromatography R* as the carrier gas at a flow rate of 1 ml/min,
- a flame-ionisation detector,
- a split ratio of 1:100,

with the following temperature programme:

	Time (min)	Temperature (°C)	Rate (°C/min)	Comment
Column	0 - 20	150 → 250	5	linear gradient
Injection port		250		
Detector		250		

The substances are eluted in the following order: cetyl alcohol, heptadecanol (internal standard) and stearyl alcohol.

Correction for interference. Inject 1 µl of test solution (a) and 1 µl of test solution (b). If the chromatogram obtained with test solution (b) shows a peak with the same retention time as the peak corresponding to the internal standard in the chromatogram obtained with test solution (a), calculate the ratio:

$$r = \frac{S_{ci}}{S_i}$$

S_{ci} = area of the peak corresponding to cetyl alcohol in the chromatogram obtained with test solution (b),

S_i = area of the peak with the same retention time as the peak corresponding to the internal standard in the chromatogram obtained with test solution (a).

If r is less than 300, calculate the corrected area $S_{Ha(corr)}$ of the peak corresponding to the internal standard in the chromatogram obtained with test solution (a):

$$S_{Ha(corr)} = S'_{Ha} - \frac{S_i \times S_c}{S_{ci}}$$

S'_{Ha} = area of the peak corresponding to the internal standard in the chromatogram obtained with test solution (a),

S_c = area of the peak corresponding to cetyl alcohol in the chromatogram obtained with test solution (a).

Inject 1 µl of test solution (c) and 1 µl of test solution (d). Carry out the correction for interference in the same manner as for test solution (a) and calculate the corrected area $S_{Hc(corr)}$ of the peak corresponding to the internal standard in the chromatogram obtained with test solution (c).

Inject equal volumes of the reference solution, test solution (c) and test solution (d). Identify the peaks in the chromatograms obtained with the test solutions by comparison of their retention times with those of the peaks in the chromatogram obtained with the reference solution. Determine the area of each peak.

Calculate the percentage content of sodium cetyl sulphate in the substance to be examined, using the expression:

$$\frac{(A \times 1.421) \times m'_H \times 100}{S_{Hc(corr)} \times m'}$$

A = area of the peak corresponding to cetyl alcohol in the chromatogram obtained with test solution (c),

m'_H = mass of the internal standard added in the preparation of test solution (c), in milligrams,

$S_{Hc(corr)}$ = corrected area of the peak corresponding to the internal standard in the chromatogram obtained with test solution (c),

m' = mass of the substance to be examined in test solution (c), in milligrams.

Calculate the percentage content of sodium stearyl sulphate in the substance to be examined, using the expression:

$$\frac{(B \times 1.377) \times m'_H \times 100}{S_{Hc(corr)} \times m'}$$

B = area of the peak corresponding to stearyl alcohol in the chromatogram obtained with test solution (c).

The percentage content of sodium cetostearyl sulphate corresponds to the sum of the percentage content of sodium cetyl sulphate and the percentage content of sodium stearyl sulphate.

LABELLING

The label states, where appropriate, the name and concentration of any added buffer.

01/2005:0193

SODIUM CHLORIDE

Natrii chloridum

NaCl

M_r 58.44

DEFINITION

Sodium chloride contains not less than 99.0 per cent and not more than the equivalent of 100.5 per cent of NaCl, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder or colourless crystals or white pearls, freely soluble in water, practically insoluble in ethanol.

IDENTIFICATION

- A. It gives the reactions of chlorides (2.3.1).
- B. It gives the reactions of sodium (2.3.1).

TESTS

If the substance is in the form of pearls crush before use.

Solution S. Dissolve 20.0 g in carbon dioxide-free water *R* prepared from distilled water *R* and dilute to 100.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, Method II).

Acidity or alkalinity. To 20 ml of solution S add 0.1 ml of bromothymol blue solution *R1*. Not more than 0.5 ml of 0.01 *M* hydrochloric acid or 0.01 *M* sodium hydroxide is required to change the colour of the indicator.

Bromides. To 0.5 ml of solution S add 4.0 ml of water *R*, 2.0 ml of phenol red solution *R2* and 1.0 ml of a 0.1 g/l solution of chloramine *R* and mix immediately. After exactly 2 min, add 0.15 ml of 0.1 *M* sodium thiosulphate, mix and dilute to 10.0 ml with water *R*. The absorbance (2.2.25) of the solution measured at 590 nm, using water *R* as the compensation liquid, is not greater than that of a standard prepared at the same time and in the same manner, using 5.0 ml of a 3.0 mg/l solution of potassium bromide *R* (100 ppm).

Ferrocyanides. Dissolve 2.0 g in 6 ml of water *R*. Add 0.5 ml of a mixture of 5 ml of a 10 g/l solution of ferric ammonium sulphate *R* in a 2.5 g/l solution of sulphuric acid *R* and 95 ml of a 10 g/l solution of ferrous sulphate *R*. No blue colour develops within 10 min.

Iodides. Moisten 5 g by the dropwise addition of a freshly prepared mixture of 0.15 ml of sodium nitrite solution *R*, 2 ml of 0.5 *M* sulphuric acid, 25 ml of iodide-free starch solution *R* and 25 ml of water *R*. After 5 min, examine in daylight. The substance shows no blue colour.

Nitrites. To 10 ml of solution S add 10 ml of water *R*. Measure the absorbance (2.2.25) of the solution at 354 nm. The absorbance is not greater than 0.01.

Phosphates (2.4.11). Dilute 2 ml of solution S to 100 ml with water *R*. The solution complies with the limit test for phosphates (25 ppm).

Sulphates (2.4.13). Dilute 7.5 ml of solution S to 30 ml with distilled water *R*. 15 ml of the solution complies with the limit test for sulphates (200 ppm).

Aluminium (2.4.17). If intended for use in the manufacture of peritoneal dialysis solutions, haemodialysis solutions or haemofiltration solutions, it complies with the test for aluminium. Dissolve 20.0 g in 100 ml of water *R* and add 10 ml of acetate buffer solution pH 6.0 *R*. The solution complies with the limit test for aluminium (0.2 ppm). Use as the reference solution a mixture of 2 ml of aluminium standard solution (2 ppm Al) *R*, 10 ml of acetate buffer solution pH 6.0 *R* and 98 ml of water *R*. To prepare the blank, use a mixture of 10 ml of acetate buffer solution pH 6.0 *R* and 100 ml of water *R*.

Arsenic (2.4.2). 5 ml of solution S complies with limit test A for arsenic (1 ppm).

Barium. To 5 ml of solution S add 5 ml of distilled water *R* and 2 ml of dilute sulphuric acid *R*. After 2 h, any opalescence in the solution is not more intense than that in a mixture of 5 ml of solution S and 7 ml of distilled water *R*.

Iron (2.4.9). 10 ml of solution S complies with the limit test for iron (2 ppm). Prepare the standard using a mixture of 4 ml of iron standard solution (1 ppm Fe) *R* and 6 ml of water *R*.

Magnesium and alkaline-earth metals (2.4.7). 10.0 g complies with the limit test for magnesium and alkaline-earth metals (use 150 mg of mordant black 11 triturate *R*. The volume of 0.01 *M* sodium edetate used does not exceed 2.5 ml (100 ppm, calculated as Ca).

Potassium. If intended for use in the manufacture of parenteral dosage forms or haemodialysis, haemofiltration or peritoneal dialysis solutions, it contains not more than 500 ppm of K, determined by atomic emission spectrometry (2.2.22, Method I).

Test solution. Dissolve 1.00 g of the substance to be examined in water *R* and dilute to 100.0 ml with the same solvent.

Reference solutions. Dissolve 1.144 g of potassium chloride *R*, previously dried at 100-105 °C for 3 h, in water *R* and dilute to 1000.0 ml with the same solvent (600 µg of K per millilitre). Dilute as required.

Measure the emission intensity at 766.5 nm.

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (5 ppm). Prepare the standard using lead standard solution (1 ppm Pb) *R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 2 h.

Bacterial endotoxins (2.6.14): less than 5 IU/g, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for removal of bacterial endotoxins.

ASSAY

Dissolve 50.0 mg in *water R* and dilute to 50 ml with the same solvent. Titrate with 0.1 M *silver nitrate* determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *silver nitrate* is equivalent to 5.844 mg of NaCl.

LABELLING

The label states:

- where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms,
- where applicable, that the substance is free from bacterial endotoxins,
- where applicable, that the substance is suitable for use in the manufacture of peritoneal dialysis solutions, haemodialysis solutions or haemofiltration solutions.

01/2005:0412

SODIUM CITRATE

Natrii citras

 $C_6H_5Na_3O_7 \cdot 2H_2O$
 M_r 294.1

DEFINITION

Sodium citrate contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of trisodium 2-hydroxypropane-1,2,3-tricarboxylate, calculated with reference to the anhydrous substance.

CHARACTERS

A white, crystalline powder or white, granular crystals, slightly deliquescent in moist air, freely soluble in water, practically insoluble in alcohol.

IDENTIFICATION

- A. To 1 ml of solution S (see Tests) add 4 ml of *water R*. The solution gives the reaction of citrates (2.3.1).
- B. 1 ml of solution S gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *phenolphthalein solution R*. Not more than 0.2 ml of 0.1 M *hydrochloric acid* or 0.1 M *sodium hydroxide* is required to change the colour of the indicator.

Readily carbonisable substances. To 0.20 g of the powdered substance to be examined add 10 ml of *sulphuric acid R* and heat in a water-bath at $90 \pm 1^\circ C$ for 60 min. Cool rapidly. The solution is not more intensely coloured than reference solution Y₂ or GY₂ (2.2.2, *Method II*).

Chlorides (2.4.4). Dilute 10 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides (50 ppm).

Oxalates. Dissolve 0.50 g in 4 ml of *water R*, add 3 ml of *hydrochloric acid R* and 1 g of granulated *zinc R* and heat on a water-bath for 1 min. Allow to stand for 2 min, decant the liquid into a test-tube containing 0.25 ml of a 10 g/l solution of *phenylhydrazine hydrochloride R* and heat to

boiling. Cool rapidly, transfer to a graduated cylinder and add an equal volume of *hydrochloric acid R* and 0.25 ml of *potassium ferricyanide solution R*. Shake and allow to stand for 30 min. Any pink colour in the solution is not more intense than that in a standard prepared at the same time in the same manner using 4 ml of a 50 mg/l solution of *oxalic acid R* (300 ppm).

Sulphates (2.4.13). To 10 ml of solution S add 2 ml of *hydrochloric acid R1* and dilute to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (150 ppm).

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution* (1 ppm Pb) R.

Water (2.5.12): 11.0 per cent to 13.0 per cent, determined on 0.300 g by the semi-micro determination of water. After adding the substance to be examined, stir for 15 min before titrating.

Pyrogens (2.6.8). If intended for use in large-volume preparations for parenteral use, the competent authority may require that it comply with the test for pyrogens. Inject per kilogram of the rabbit's mass 10 ml of a freshly prepared solution in *water for injections R* containing per millilitre 10.0 mg of the substance to be examined and 7.5 mg of pyrogen-free *calcium chloride R*.

ASSAY

Dissolve 0.150 g in 20 ml of *anhydrous acetic acid R*, heating to about $50^\circ C$. Allow to cool. Using 0.25 ml of *naphtholbenzein solution R* as indicator, titrate with 0.1 M *perchloric acid* until a green colour is obtained.

1 ml of 0.1 M *perchloric acid* is equivalent to 8.602 mg of $C_6H_5Na_3O_7$.

STORAGE

Store in an airtight container.

01/2005:0562

SODIUM CROMOGLICATE

Natrii cromoglicas

 $C_{23}H_{14}Na_2O_{11}$
 M_r 512.3

DEFINITION

Sodium cromoglicate contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of disodium 5,5'-[(2-hydroxypropane-1,3-diyl)bis(oxy)]bis(4-oxo-4H-1-benzopyran-2-carboxylate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, hygroscopic, soluble in water, practically insoluble in alcohol.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

- A. Dissolve 10.0 mg in *phosphate buffer solution pH 7.4 R* and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml of this solution to 100.0 ml with the same solvent. Examined between 230 nm and 350 nm (2.2.25), the solution shows two absorption maxima, at 239 nm and 327 nm. The ratio of the absorbance at the maximum at 327 nm to that at the maximum at 239 nm is 0.25 to 0.30.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *sodium cromoglicate CRS*. Examine the substances prepared as discs.
- C. Dissolve about 5 mg in 0.5 ml of *methanol R*. Add 3 ml of a solution in *methanol R* containing 5 g/l of *aminopyrazolone R* and 1 per cent V/V of *hydrochloric acid R*. Allow to stand for 5 min. The solution shows an intense yellow colour.
- D. It gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 0.5 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension II (2.2.1) and not more intensely coloured than reference solution BY₅ (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *phenolphthalein solution R*. The solution is colourless. Add 0.2 ml of 0.01 M *sodium hydroxide*. The solution is pink. Add 0.4 ml of 0.01 M *hydrochloric acid*. The solution is colourless. Add 0.25 ml of *methyl red solution R*. The solution is red.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 0.2 g of the substance to be examined in a mixture of 1 volume of *acetone R*, 4 volumes of *tetrahydrofuran R* and 6 volumes of *water R* and dilute to 10 ml with the same mixture of solvents.

Reference solution. Dissolve 10 mg of *1,3-bis(2-acetyl-3-hydroxyphenoxy)-2-propanol CRS* in *chloroform R* and dilute to 100 ml with the same solvent.

Apply separately to the plate 5 µl of each solution. Develop over a path of 10 cm using a mixture of 5 volumes of *glacial acetic acid R*, 50 volumes of *ethyl acetate R* and 50 volumes of *toluene R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot (which remains at the starting point), is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Oxalate. Dissolve 0.10 g in 20 ml of *water R*, add 5.0 ml of *iron salicylate solution R* and dilute to 50.0 ml with *water R*. Determine the absorbance (2.2.25) at 480 nm. The absorbance is not less than that of a standard prepared in the same manner using 0.35 mg of *oxalic acid R* instead of the substance to be examined.

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 10.0 per cent, determined on 1.000 g by drying over *diphosphorus pentoxide R* at 100 °C to 105 °C and at a pressure of 300 Pa to 600 Pa.

ASSAY

Dissolve 0.200 g with heating in a mixture of 5 ml of *2-propanol R* and 25 ml of *ethylene glycol R*. Cool and add 30 ml of *dioxan R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 25.62 mg of C₂₃H₁₄Na₂O₁₁.

STORAGE

Store in an airtight container, protected from light.

01/2005:0774

SODIUM CYCLAMATE

Natrii cyclamas

C₆H₁₂NNaO₃SM_r 201.2

DEFINITION

Sodium cyclamate contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of sodium *N*-cyclohexylsulphamate, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder or colourless crystals, freely soluble in water, slightly soluble in alcohol.

IDENTIFICATION

First identification: A, E.

Second identification: B, C, D, E.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *sodium cyclamate CRS*.
- B. Examine the chromatograms obtained in the test for sulphamic acid. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- C. To 1 ml of solution S (see Tests), add 1 ml of *water R* and 2 ml of *silver nitrate solution R1* and shake. A white, crystalline precipitate is formed.
- D. To 1 ml of solution S add 5 ml of *water R*, 2 ml of *dilute hydrochloric acid R* and 4 ml of *barium chloride solution R1* and mix. The solution is clear. Add 2 ml of *sodium nitrite solution R*. A voluminous white precipitate is formed and gas is given off.
- E. A mixture of 1 ml of solution S and 1 ml of *water R* gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 5 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 5.5 to 7.5.

Absorbance (2.2.25). The absorbance of solution S, measured at 270 nm, is not greater than 0.10.

Sulphamic acid. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel G plate R*.

Test solution (a). Use solution S.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *water R*.

Reference solution (a). Dissolve 0.10 g of *sodium cyclamate CRS* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *sulphamic acid R* in *water R* and dilute to 100 ml with the same solvent.

Apply to the plate 2 µl of each solution. Develop over a path of 12 cm using a mixture of 10 volumes of *concentrated ammonia R*, 10 volumes of *water R*, 20 volumes of *ethyl acetate R* and 70 volumes of *propanol R*. Dry the plate in a current of warm air, heat at 105 °C for 5 min and spray the hot plate with *strong sodium hypochlorite solution R* diluted to a concentration of 5 g/l of active chlorine. Place the plate in a current of cold air until an area of coating below the points of application gives at most a faint blue colour with a drop of *potassium iodide and starch solution R*; avoid prolonged exposure to cold air. Spray with *potassium iodide and starch solution R* and examine the chromatograms within 5 min. Any spot corresponding to sulphamic acid in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.1 per cent).

Aniline, cyclohexylamine and dicyclohexylamine. Not more than 1 ppm of aniline, not more than 10 ppm of cyclohexylamine and not more than 1 ppm of dicyclohexylamine determined by gas chromatography (2.2.28) using *tetradecane R* as the internal standard.

Internal standard solution. Dissolve 2 µl of *tetradecane R* in *methylene chloride R* and dilute to 100 ml with the same solvent.

Test solution. Dissolve 2.00 g of the substance to be examined in 20 ml of *water R* and add 0.5 ml of *strong sodium hydroxide solution R* and shake with 30 ml of *toluene R*. Shake 20 ml of the upper layer with 4 ml of a mixture of equal volumes of *dilute acetic acid R* and *water R*. Separate the lower layer and add 0.5 ml of *strong sodium hydroxide solution R* and 0.5 ml of the internal standard solution. Shake and use the lower layer for chromatography immediately after separation.

Reference solution. Dissolve 10.0 mg (about 12 µl) of *cyclohexylamine R*, 1.0 mg (about 1.1 µl) of *dicyclohexylamine R* and 1.0 mg (about 1 µl) of *aniline R* in *water R* and dilute to 1000 ml with the same solvent. Dilute 10.0 ml of this solution to 100.0 ml with *water R* (solution A). To 20.0 ml of solution A, add 0.5 ml of *strong sodium hydroxide solution R* and extract with 30 ml of *toluene R*. Shake 20 ml of the upper layer with 4 ml of a mixture of equal volumes of *dilute acetic acid R* and *water R*. Separate the lower layer and add 0.5 ml of *strong sodium hydroxide solution R* and 0.5 ml of the internal standard solution. Shake and use the lower layer for chromatography immediately after separation.

The chromatographic procedure may be carried out using:

- a fused silica column 25 m long and 0.32 mm in internal diameter coated with *poly(dimethyl)(diphenyl)siloxane R* (0.51 µm),
 - *helium for chromatography R* as the carrier gas at a flow rate of 1.8 ml/min,
 - a flame-ionisation detector,
 - a split vent at a flow rate of 20 ml/min,
- with the following temperature programme:

	Time (min)	Temperature (°C)	Rate (°C/min)	Comment
Column	0 - 1	85		isothermal
	1 - 9	85 → 150	8	linear gradient
	9 - 13	150		isothermal
Injection port		250		
Detector		270		

Inject 1.5 µl of each solution. When the chromatograms are recorded in the conditions prescribed, the retention times relative to cyclohexylamine (about 2.3 min) are the following: aniline about 1.4, tetradecane about 4.3 and dicyclohexylamine about 4.5.

Sulphates (2.4.13). Dilute 1.5 ml of solution S to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (0.1 per cent).

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g in an oven at 100 °C to 105 °C for 4 h.

ASSAY

Dissolve without heating 0.150 g in 60 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 20.12 mg of C₆H₁₂NNaO₃S.

IMPURITIES

A. sulphamic acid,

B. aniline (phenylamine),

C. cyclohexylamine,

D. *N*-cyclohexylcyclohexylamine.

01/2005:0194

SODIUM DIHYDROGEN PHOSPHATE DIHYDRATE

Natrii dihydrogenophosphas dihydricus

M_r 156.0

DEFINITION

Sodium dihydrogen phosphate dihydrate contains not less than 98.0 per cent and not more than the equivalent of 100.5 per cent of NaH₂PO₄, calculated with reference to the dried substance.

CHARACTERS

A white powder or colourless crystals, very soluble in water, very slightly soluble in alcohol.

IDENTIFICATION

- A. Solution S (see Tests) is faintly acid (2.2.4).
 B. Solution S gives the reactions of phosphates (2.3.1).
 C. Solution S previously neutralised using a 100 g/l solution of *potassium hydroxide R* gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). To 5 ml of solution S add 5 ml of *carbon dioxide-free water R*. The pH of the solution is 4.2 to 4.5.

Reducing substances. To 5 ml of solution S add 0.25 ml of 0.02 M *potassium permanganate* and 5 ml of *dilute sulphuric acid R* and heat in a water-bath for 5 min. The solution retains a slight red colour.

Chlorides (2.4.4). 2.5 ml of solution S diluted to 15 ml with *water R* complies with the limit test for chlorides (200 ppm).

Sulphates (2.4.13). To 5 ml of solution S add 0.5 ml of *hydrochloric acid R* and dilute to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (300 ppm).

Arsenic (2.4.2). 0.5 g complies with limit test A for arsenic (2 ppm).

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Iron (2.4.9). 10 ml of solution S complies with the limit test for iron (10 ppm).

Loss on drying (2.2.32). 21.5 per cent to 24.0 per cent, determined on 0.50 g by drying in an oven at 130 °C.

ASSAY

Dissolve 2.500 g in 40 ml of *water R*. Titrate with carbonate-free 1 M *sodium hydroxide*, determining the end-point potentiometrically (2.2.20).

1 ml of 1 M *sodium hydroxide* is equivalent to 0.120 g of NaH_2PO_4 .

DEFINITION

Sodium fluoride contains not less than 98.5 per cent and not more than the equivalent of 100.5 per cent of NaF, calculated with reference to the dried substance.

CHARACTERS

A white powder or colourless crystals, soluble in water, practically insoluble in alcohol.

IDENTIFICATION

- A. To 2 ml of solution S (see Tests) add 0.5 ml of *calcium chloride solution R*. A gelatinous white precipitate is formed which dissolves on adding 5 ml of *ferric chloride solution R1*.
 B. To about 4 mg add a mixture of 0.1 ml of *alizarin S solution R* and 0.1 ml of *zirconyl nitrate solution R* and mix. The colour changes from red to yellow.
 C. Solution S gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* without heating and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. Dissolve 2.5 g of *potassium nitrate R* in 40 ml of solution S and dilute to 50 ml with *carbon dioxide-free water R*. Cool to 0 °C and add 0.2 ml of *phenolphthalein solution R*. If the solution is colourless, not more than 1.0 ml of 0.1 M *sodium hydroxide* is required to produce a red colour that persists for at least 15 s. If the solution is red, not more than 0.25 ml of 0.1 M *hydrochloric acid* is required to change the colour of the indicator.

Chlorides (2.4.4). Dilute 10 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides (200 ppm).

Fluorosilicates. Heat to boiling the neutralised solution obtained in the test for acidity or alkalinity and titrate whilst hot. Not more than 0.75 ml of 0.1 M *sodium hydroxide* is required to change the colour of the indicator to red.

Sulphates (2.4.13). Dissolve 0.25 g in 10 ml of a saturated solution of *boric acid R* in *distilled water R*. Add 5 ml of *distilled water R* and 0.6 ml of *hydrochloric acid R1*. The solution complies with the limit test for sulphates (200 ppm). Prepare the standard by mixing 0.6 ml of *hydrochloric acid R1*, 5 ml of *sulphate standard solution (10 ppm SO₄) R* and 10 ml of a saturated solution of *boric acid R* in *distilled water R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 130 °C for 3 h.

01/2005:0514

ASSAY

To 80.0 mg add a mixture of 5 ml of *acetic anhydride R* and 20 ml of *anhydrous acetic acid R* and heat to dissolve. Allow to cool and add 20 ml of *dioxan R*. Using 0.1 ml of *crystal violet solution R* as indicator, titrate with 0.1 M *perchloric acid* until a green colour is obtained. Carry out a blank titration.

1 ml of 0.1 M *perchloric acid* is equivalent to 4.199 mg of NaF.

SODIUM FLUORIDE

Natrii fluoridum

NaF

 M_r 41.99

01/2005:0848

SODIUM FUSIDATE

Natrii fusidas

 $C_{31}H_{47}NaO_6$ M_r 538.7

DEFINITION

Sodium fusidate is sodium sodium (*Z*)-*ent*-16 α -(acetyloxy)-3 β ,11 β -dihydroxy-4 β ,8,14-trimethyl-18-nor-5 β ,10 α -cholesta-17(20),24-dien-21-oate, an antimicrobial substance produced by the growth of certain strains of *Fusidium coccineum* or by any other means. It contains not less than 97.5 per cent and not more than the equivalent of 101.0 per cent of $C_{31}H_{47}NaO_6$, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, slightly hygroscopic, freely soluble in water and in alcohol.

IDENTIFICATION

- A. Examine by infrared absorption spectrophotometry (2.2.24). Dissolve 0.1 g in 5 ml of *water R*, add 5 ml of *chloroform R* and 0.1 ml of *dilute phosphoric acid R*. Shake vigorously for 1 min, allow to separate and filter the lower layer through absorbent cotton covered with *anhydrous sodium sulphate R*. Repeat the extraction with two quantities, each of 5 ml, of *chloroform R* and evaporate the combined extracts to dryness under reduced pressure. Dry the residue over *diphosphorus pentoxide R* under reduced pressure for 2 h, dissolve in 1 ml of *chloroform R*. Compare the spectrum obtained with the *Ph. Eur. reference spectrum of fusidic acid*.
- B. Examine by thin-layer chromatography (2.2.27), using *silica gel HF₂₅₄ R* as the coating substance.

Test solution. Dissolve 20 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 24 mg of *diethanolamine fusidate CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Apply to the plate 10 μ l of each solution. Develop over a path of 15 cm using a mixture of 2.5 volumes of *methanol R*, 10 volumes of *glacial acetic acid R*, 10 volumes of *cyclohexane R* and 80 volumes of *chloroform R*. Dry the plate in a current of hot air. Examine in ultraviolet light at 254 nm. The principal spot

in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

- C. Ignite 1 g. The residue gives reaction (a) of sodium (2.3.1).

TESTS

Appearance of solution. Dissolve 1.5 g in 10 ml of *water R*. The solution is not more intensely coloured than reference solution B₆ (2.2.2, *Method II*).

pH (2.2.3). Dissolve 0.125 g in 10 ml of *carbon dioxide-free water R*. The pH of the solution is 7.5 to 9.0.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 50 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 5 mg of *3-ketofusidic acid CRS* in 5 ml of the mobile phase. To 1.0 ml of this solution add 0.20 ml of the test solution and dilute to 20.0 ml with the mobile phase.

Reference solution (b). Dilute 20 μ l of the test solution to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a steel column 0.125 m to 0.15 m long and 4 mm to 5 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 μ m),
- as mobile phase at a flow rate of 2 ml/min a mixture of 10 volumes of *methanol R*, 20 volumes of a 10 g/l solution of *phosphoric acid R*, 20 volumes of *water R* and 50 volumes of *acetonitrile R*,
- as detector a spectrophotometer set at 235 nm,
- a 20 μ l loop injector.

Continue the chromatography for at least 3.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the sum of the areas of the peaks, apart from the principal peak and the solvent peak, is not greater than twice the area of the peak corresponding to sodium fusidate in the chromatogram obtained with reference solution (a) (2.0 per cent). Disregard any peak with an area less than that of the principal peak in the chromatogram obtained with reference solution (b). The test is not valid unless: the resolution between the peaks corresponding to 3-ketofusidic acid and sodium fusidate in the chromatogram obtained with reference solution (a) is at least 2.5; the principal peak in the chromatogram obtained with reference solution (b) has a signal-to-noise ratio of at least 3.

Water (2.5.12). Not more than 2.0 per cent, determined on 0.50 g by the semi-micro determination of water.

ASSAY

Dissolve 0.500 g in 30 ml of *water R* and add 40 ml of *alcohol R*. Titrate with 0.1 M *hydrochloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *hydrochloric acid* is equivalent to 53.87 mg of $C_{31}H_{47}NaO_6$.

STORAGE

Store in an airtight container, protected from light, at a temperature of 2 °C to 8 °C.

Natrii glycerophosphas hydricus

C₃H₇Na₂O₆P, xH₂O M_r 216.0 (anhydrous substance)**DEFINITION**

Mixture of variable proportions of sodium (2*RS*)-2,3-dihydroxypropyl phosphate and sodium 2-hydroxy-1-(hydroxymethyl)ethyl phosphate. The degree of hydration is 4 to 6.

Content: 98.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white, crystalline powder or crystals.

Solubility: freely soluble in water, practically insoluble in acetone and in alcohol.

IDENTIFICATION

- A. Solution S (see Tests) gives reaction (a) of sodium (2.3.1).
- B. To 0.1 g add 5 ml of *dilute nitric acid R*. Heat to boiling and boil for 1 min. Cool. The solution gives reaction (b) of phosphates (2.3.1).
- C. In a test-tube fitted with a glass tube, mix 0.1 g with 5 g of *potassium hydrogen sulphate R*. Heat strongly and direct the white vapour into 5 ml of *decolorised fuchsin solution R*. A violet-red colour develops which becomes violet upon heating for 30 min on a water-bath.

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension II (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, *Method II*).

Alkalinity. To 10 ml of solution S add 0.2 ml of *phenolphthalein solution R*. Not more than 1.0 ml of 0.1 *M hydrochloric acid* is required to change the colour of the indicator, (*n*₂).

Glycerol and alcohol-soluble substances: maximum 1.0 per cent.

Shake 1.000 g with 25 ml of *alcohol R* for 10 min. Filter. Evaporate the filtrate on a water-bath and dry the residue at 70 °C for 1 h. The residue weighs not more than 10 mg.

Chlorides (2.4.4): maximum 200 ppm.

Dilute 2.5 ml of solution S to 15 ml with *water R*.

Phosphates (2.4.11): maximum 0.1 per cent.

Dilute 1 ml of solution S to 10 ml with *water R*. Dilute 1 ml of this solution to 100 ml with *water R*.

Sulphates (2.4.13): maximum 500 ppm.

Dilute 3 ml of solution S to 15 ml with *water R*.

Iron (2.4.9): maximum 20 ppm.

Dilute 5 ml of solution S to 10 ml with *water R*.

Dilute 10 ml of solution S to 20 ml with *water R*. 12 ml of the solution complies with limit test A. Prepare the standard using 10 ml of *lead standard solution (1 ppm Pb) R*.

Water (2.5.12): 25.0 per cent to 35.0 per cent, determined on 0.100 g.

ASSAY

Dissolve 0.250 g in 30 ml of *water R*. Titrate with 0.05 *M sulphuric acid*, determining the end-point potentiometrically (2.2.20), (*n*₁).

Calculate the percentage content of sodium glycerophosphate (anhydrous substance) from the expression:

$$\frac{216.0 \left(n_1 - \frac{n_2}{4} \right)}{m (100 - a)}$$

a = percentage content of water,

*n*₁ = volume of 0.05 *M sulphuric acid* used in the assay, in millilitres,

*n*₂ = volume of 0.1 *M hydrochloric acid* used in the test for alkalinity, in millilitres,

m = mass of the substance to be examined, in grams.

01/2005:1472
corrected**SODIUM HYALURONATE**

Natrii hyaluronas

(C₁₄H₂₀NNaO₁₁)_n**DEFINITION**

Sodium hyaluronate is the sodium salt of hyaluronic acid, a glycosaminoglycan consisting of D-glucuronic acid and N-acetyl-D-glucosamine disaccharide units. It contains not less than 95.0 per cent and not more than the equivalent of 105.0 per cent of sodium hyaluronate, calculated with reference to the dried substance. It has an intrinsic viscosity of not less than 90 per cent and not more than 120 per cent of the value stated on the label.

PRODUCTION

Sodium hyaluronate is extracted from cocks' combs or obtained by fermentation from *Streptococci*, Lancefield Groups A and C. It is produced by methods of manufacture designed to minimise or eliminate infectious agents. When produced by fermentation of gram-positive bacteria, the process must be shown to reduce or eliminate pyrogenic or inflammatory components of the cell wall.

CHARACTERS

A white or almost white, very hygroscopic powder or a fibrous aggregate, sparingly soluble to soluble in water, practically insoluble in acetone and in ethanol.

IDENTIFICATION

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of sodium hyaluronate*.
- B. It gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Weigh a quantity of the substance to be examined equivalent to 0.10 g of the dried substance and add 30.0 ml of a 9 g/l solution of *sodium chloride R*. Mix gently on a shaker until dissolved (about 12 h).

Appearance of solution. Solution S is clear (2.2.1). The absorbance of solution S measured at 600 nm (2.2.25) is not greater than 0.01.

pH (2.2.3). Dissolve the substance to be examined in *carbon dioxide-free water R* to obtain a solution containing a quantity equivalent to 5 mg of the dried substance per millilitre. The pH of the solution is 5.0 to 8.5.

Intrinsic viscosity. *Sodium hyaluronate is very hygroscopic and must be protected from moisture during weighing.*

Buffer solution (0.15 M sodium chloride in 0.01 M phosphate buffer solution pH 7.0). Dissolve 0.78 g of *sodium dihydrogen phosphate R* and 4.50 g of *sodium chloride R* in *water R* and dilute to 500.0 ml with the same solvent (solution A). Dissolve 1.79 g of *disodium hydrogen phosphate R* and 4.50 g of *sodium chloride R* in *water R* and dilute to 500.0 ml with the same solvent (solution B). Mix solutions A and B until a pH of 7.0 is reached. Filter through a sintered-glass filter (4).

Test solution (a) (concentration c_1 of sodium hyaluronate). Weigh 0.200 g (m_{op}) (*NOTE: this value is only indicative and should be adjusted after an initial measurement of the viscosity of test solution (a)*) of the substance to be examined and dilute with 50.0 g (m_{os}) of buffer solution at 4 °C. Mix the solution by shaking at 4 °C during 24 h. Weigh 5.00 g (m_{1p}) of this solution and dilute with 100.0 g (m_{1s}) of buffer solution at 25 °C. Mix this solution by shaking for 20 min. Filter the solution through a sintered-glass filter (100), and discard the first 10 ml.

Test solution (b) (concentration c_2 of sodium hyaluronate). Weigh 30.0 g (m_{2p}) of test solution (a) and dilute with 10.0 g (m_{2s}) of buffer solution at 25 °C. Mix this solution by shaking for 20 min. Filter the solution through a sintered-glass filter (100) and discard the first 10 ml.

Test solution (c) (concentration c_3 of sodium hyaluronate). Weigh 20.0 g (m_{3p}) of test solution (a) and dilute with 20.0 g (m_{3s}) of buffer solution at 25 °C. Mix this solution by shaking for 20 min. Filter the solution through a sintered-glass filter (100) and discard the first 10 ml.

Test solution (d) (concentration c_4 of sodium hyaluronate). Weigh 10.0 g (m_{4p}) of test solution (a) and dilute with 30.0 g (m_{4s}) of buffer solution at 25 °C. Mix this solution by shaking for 20 min. Filter the solution through a sintered-glass filter (100) and discard the first 10 ml.

Determine the flow-time for the buffer solution (t_0) and the flow times for the four test solutions (t_1 , t_2 , t_3 and t_4), at 25.00 ± 0.03 °C (2.2.9). Use an appropriate suspended level viscometer (specifications: viscometer constant about $0.005 \text{ mm}^2/\text{s}^2$, kinematic viscosity range 1 to $5 \text{ mm}^2/\text{s}^2$, internal diameter of tube *R* 0.53 mm, volume of bulb *C* 5.6 ml, internal diameter of tube *N* 2.8 mm to 3.2 mm) with a funnel-shaped lower capillary end. Use the same viscometer for all measurements; measure all outflow times in triplicate. The test is not valid unless the results do not differ by more

than 0.35 per cent from the mean and if the flow time t_1 is not less than 1.6 and not more than 1.8 times t_0 . If this is not the case, adjust the value of m_{op} and repeat the procedure.

Calculation of the relative viscosities

Since the densities of the sodium hyaluronate solutions and of the solvent are almost equal, the relative viscosities η_{ri} (being η_{r1} , η_{r2} , η_{r3} and η_{r4}) can be calculated from the ratio of the flow times for the respective solutions t_i (being t_1 , t_2 , t_3 and t_4) to the flow time of the solvent t_0 , but taking into account the kinetic energy correction factor for the capillary ($B = 30\,800 \text{ s}^3$), as shown below:

$$\eta_{ri} = \frac{t_i - \frac{B}{t_i^2}}{t_0 - \frac{B}{t_0^2}}$$

Calculation of the concentrations

Calculation of the concentration c_1 (expressed in kg/m^3) of sodium hyaluronate in test solution (a)

$$c_1 = m_{op} \times \frac{x}{100} \times \frac{100 - h}{100} \times \frac{1}{m_{op} + m_{os}} \times \frac{m_{1p}}{m_{1p} + m_{1s}} \times \rho_{25}$$

x = percentage content of sodium hyaluronate as determined under Assay,

h = loss on drying as a percentage,

ρ_{25} = $1005 \text{ kg}/\text{m}^3$ (density of the test solution at 25 °C).

Calculation of the other concentrations

$$c_2 = c_1 \times \frac{m_{2p}}{m_{2s} + m_{2p}}$$

$$c_3 = c_1 \times \frac{m_{3p}}{m_{3s} + m_{3p}}$$

$$c_4 = c_1 \times \frac{m_{4p}}{m_{4s} + m_{4p}}$$

Calculation of the intrinsic viscosity

The intrinsic viscosity $[\eta]$ is calculated by linear least-squares regression analysis using the Martin equation:

$$\log \left(\frac{\eta_r - 1}{c} \right) = \log [\eta] + k [\eta] c$$

The decimal antilogarithm of the intercept is the intrinsic viscosity expressed in m^3/kg .

Sulphated glycosaminoglycans. *If the product is extracted from cocks' combs, it complies with the following requirement. Appropriate safety precautions are to be taken when handling perchloric acid at elevated temperature.*

Test solution. Introduce a quantity of the substance to be examined equivalent to 50.0 mg of the dried substance into a test-tube 150 mm long and 16 mm in internal diameter and dissolve in 1.0 ml of *perchloric acid R*.

Reference solution. Dissolve 0.149 g of *anhydrous sodium sulphate R* in *water R* and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml to 100.0 ml with *water R*. Evaporate 1.0 ml in a test-tube 150 mm long and 16 mm in internal diameter in a heating block at 90 °C to 95 °C, and dissolve the residue in 1.0 ml of *perchloric acid R*.

Plug each test-tube with a piece of glass wool. Place the test-tubes in a heating block or a silicone oil bath maintained at 180 °C and heat until clear, colourless solutions are obtained (about 12 h). Remove the test-tubes and cool to room temperature. Add to each test-tube 3.0 ml of a 33.3 g/l solution of *barium chloride R*, cap and shake vigorously.

Allow the test-tubes to stand for 30 min. Shake each test-tube once again, and determine the absorbance (2.2.25) at 660 nm, using *water R* as a blank.

The absorbance obtained with the test solution is not greater than the absorbance obtained with the reference solution (1 per cent).

Nucleic acids. The absorbance (2.2.25) of solution S at 260 nm is not greater than 0.5.

Protein. Not more than 0.3 per cent. If intended for use in the manufacture of parenteral dosage forms, not more than 0.1 per cent.

Test solution (a). Dissolve the substance to be examined in *water R* to obtain a solution containing a quantity equivalent to about 10 mg of the dried substance per millilitre.

Test solution (b). Mix equal volumes of test solution (a) and *water R*.

Reference solutions. Prepare a 0.5 mg/ml stock solution of *bovine albumin R* in *water R*. Prepare five dilutions of the stock solution containing between 5 µg/ml and 50 µg/ml of *bovine albumin R*.

Add 2.5 ml of freshly prepared *cupri-tartaric solution R3* to test-tubes containing 2.5 ml of *water R* (blank), 2.5 ml of the test solutions (a) or (b) or 2.5 ml of the reference solutions. Mix after each addition. After about 10 min, add to each test-tube 0.50 ml of a mixture of equal volumes of *water R* and *phosphomolybdotungstic reagent R* prepared immediately before use. Mix after each addition. After 30 min, measure the absorbance (2.2.25) of each solution at 750 nm against the blank. From the calibration curve obtained with the five reference solutions determine the content of protein in the test solutions.

Chlorides (2.4.4). Dissolve 67 mg in 100 ml of *water R*. 15 ml of the solution complies with the limit test for chlorides (0.5 per cent).

Iron. Not more than 80 ppm of Fe, determined by atomic absorption spectrometry (2.2.23, *Method II*).

Test solution. Dissolve a quantity of the substance to be examined equivalent to 0.25 g of the dried substance in 1 ml of *nitric acid R* by heating on a water-bath. Cool and dilute to 10.0 ml with *water R*.

Reference solutions. Prepare two reference solutions in the same manner as the test solution, adding 1.0 ml and 2.0 ml respectively of *iron standard solution (10 ppm Fe) R* to the dissolved substance to be examined.

Measure the absorbance at 248.3 nm, using an iron hollow-cathode lamp as source of radiation, a transmission band of 0.2 nm and an air-acetylene flame.

Loss on drying (2.2.32). Not more than 20.0 per cent, determined on 0.500 g by drying at 100–110 °C over *diphosphorus pentoxide R* for 6 h.

Microbial contamination. Total aerobic viable count (2.6.12) not more than 10² micro-organisms per gram. Use 1 g of the substance to be examined.

Bacterial endotoxins (2.6.14): if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins, less than 0.5 IU/mg. If intended for use in the manufacture of intra-ocular preparations or intra-articular preparations without a further appropriate procedure for the removal of bacterial endotoxins, less than 0.05 IU/mg.

ASSAY

Determine the glucuronic acid content by reaction with carbazole as described below.

Reagent A. Dissolve 0.95 g of *disodium tetraborate R* in 100.0 ml of *sulphuric acid R*.

Reagent B. Dissolve 0.125 g of *carbazole R* in 100.0 ml of *ethanol R*.

Test solution. Prepare this solution in triplicate. Dissolve 0.170 g of the substance to be examined in *water R* and dilute to 100.0 g with the same solvent. Dilute 10.0 g of this solution to 200.0 g with *water R*.

Reference stock solution. Dissolve 0.100 g of *D-glucuronic acid R*, previously dried to constant mass in vacuum over *diphosphorus pentoxide R* (2.2.32), in *water R* and dilute to 100.0 g with the same solvent.

Reference solutions. Prepare five dilutions of the reference stock solution containing between 6.5 µg/g and 65 µg/g of *D-glucuronic acid R*.

Place 25 test-tubes, numbered 1 to 25, in iced water. Add 1.0 ml of the five reference solutions in triplicate to the test-tubes 1 to 15 (reference tubes), 1.0 ml of the three test solutions in triplicate to the test-tubes 16 to 24 (sample tubes), and 1.0 ml of *water R* to test-tube 25 (blank). Add 5.0 ml of freshly prepared reagent A to each test-tube. Tightly close the test-tubes with plastic caps, shake the contents, and place on a water bath for exactly 15 min. Cool in iced water, and add to each test tube 0.20 ml of reagent B. Recap the tubes, shake, and put them again on a water-bath for exactly 15 min. Cool to room temperature and measure the absorbance (2.2.25) of the solutions at 530 nm, against the blank.

From the calibration curve obtained with the mean absorbances read for each reference solution, determine the mean concentrations of *D-glucuronic acid* in the test solutions.

Calculate the percentage content of sodium hyaluronate from the expression:

$$\frac{c_g}{c_s} \times Z \times \frac{100}{100 - h} \times \frac{401.3}{194.1}$$

- c_g = mean of concentrations of *D-glucuronic acid* in the test solutions, in milligrams per gram,
 c_s = mean of concentrations of the substance to be examined in the test solutions, in milligrams per gram,
 Z = determined percentage content of $C_6H_{10}O_7$ in *D-glucuronic acid R*,
 h = loss on drying as a percentage,
 401.3 = relative molecular mass of the disaccharide fragment,
 194.1 = relative molecular mass of glucuronic acid.

STORAGE

Store in an airtight container, protected from light and humidity. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states:

- the intrinsic viscosity,
- the origin of the substance,
- the intended use of the substance,
- where applicable, that the substance is suitable for parenteral administration other than intra-articular administration,

- where applicable, that the substance is suitable for parenteral administration, including intra-articular administration,
- where applicable that the material is suitable for intra-ocular use.

01/2005:0195

SODIUM HYDROGEN CARBONATE**Natrii hydrogenocarbonas**NaHCO₃*M_r* 84.0**DEFINITION**

Sodium hydrogen carbonate contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of NaHCO₃.

CHARACTERS

A white, crystalline powder, soluble in water, practically insoluble in alcohol. When heated in the dry state or in solution, it gradually changes into sodium carbonate.

IDENTIFICATION

- To 5 ml of solution S (see Tests) add 0.1 ml of *phenolphthalein solution R*. A pale pink colour is produced. Heat; gas is evolved and the solution becomes red.
- It gives the reaction of carbonates and bicarbonates (2.3.1).
- Solution S gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 5.0 g in 90 ml of *carbon dioxide-free water R* and dilute to 100.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Carbonates. The pH (2.2.3) of freshly prepared solution S is not more than 8.6.

Chlorides (2.4.4). To 7 ml of solution S add 2 ml of *nitric acid R* and dilute to 15 ml with *water R*. The solution complies with the limit test for chlorides (150 ppm).

Sulphates (2.4.13). To a suspension of 1.0 g in 10 ml of *distilled water R* add *hydrochloric acid R* until neutral and about 1 ml in excess. Dilute to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (150 ppm).

Ammonium (2.4.1). 10 ml of solution S diluted to 15 ml with *water R* complies with the limit test for ammonium (20 ppm). Prepare the standard using a mixture of 5 ml of *water R* and 10 ml of *ammonium standard solution* (1 ppm NH₄) *R*.

Arsenic (2.4.2). 0.5 g complies with limit test A for arsenic (2 ppm).

Calcium (2.4.3). To a suspension of 1.0 g in 10 ml of *distilled water R* add *hydrochloric acid R* until neutral and dilute to 15 ml with *distilled water R*. The solution complies with the limit test for calcium (100 ppm).

Iron (2.4.9). Dissolve 0.5 g in 5 ml of *dilute hydrochloric acid R* and dilute to 10 ml with *water R*. The solution complies with the limit test for iron (20 ppm).

Heavy metals (2.4.8). Dissolve 2.0 g in a mixture of 2 ml of *hydrochloric acid R* and 18 ml of *water R*. 12 ml of the solution complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution* (1 ppm Pb) *R*.

ASSAY

Dissolve 1.500 g in 50 ml of *carbon dioxide-free water R*. Titrate with 1 *M hydrochloric acid*, using 0.2 ml of *methyl orange solution R* as indicator.

1 ml of 1 *M hydrochloric acid* is equivalent to 84.0 mg of NaHCO₃.

01/2005:0677

SODIUM HYDROXIDE**Natrii hydroxidum**

NaOH

M_r 40.00**DEFINITION**

Sodium hydroxide contains not less than 97.0 per cent and not more than the equivalent of 100.5 per cent of total alkali, calculated as NaOH.

CHARACTERS

White, crystalline masses, supplied as pellets, sticks or slabs, deliquescent, readily absorbing carbon dioxide, very soluble in water, freely soluble in alcohol.

IDENTIFICATION

- Dissolve 0.1 g in 10 ml of *water R*. Dilute 1 ml of the solution to 100 ml with *water R*. The pH (2.2.3) of the final solution is not less than 11.0.
- 2 ml of solution S (see Tests) gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Carry out the procedure described below with caution. Dissolve 5.0 g in 12 ml of *distilled water R*. Add 17 ml of *hydrochloric acid R1*, adjust to pH 7 with 1 *M hydrochloric acid* and dilute to 50 ml with *distilled water R*.

Appearance of solution. Dissolve 1.0 g in 10 ml of *water R*. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Carbonates. Not more than 2.0 per cent, calculated as Na₂CO₃, as determined in the assay.

Chlorides (2.4.4). Dissolve 1.0 g in 5 ml of *water R*, acidify the solution with about 4 ml of *nitric acid R* and dilute to 15 ml with *water R*. The solution, without addition of *dilute nitric acid R*, complies with the limit test for chlorides (50 ppm).

Sulphates (2.4.13). Dissolve 3.0 g in 6 ml of *distilled water R*, adjust to pH 7 with *hydrochloric acid R* (about 7.5 ml) and dilute to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (50 ppm).

Iron (2.4.9). 10 ml of solution S complies with the limit test for iron (10 ppm).

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution* (2 ppm Pb) *R*.

ASSAY

Dissolve 2.000 g in about 80 ml of *carbon dioxide-free water R*. Add 0.3 ml of *phenolphthalein solution R* and titrate with 1 *M hydrochloric acid*. Add 0.3 ml of *methyl orange solution R* and continue the titration with 1 *M hydrochloric acid*.

1 ml of 1 *M hydrochloric acid* used in the second part of the titration is equivalent to 0.1060 g of Na₂CO₃.

1 ml of 1 *M hydrochloric acid* used in the combined titrations is equivalent to 40.00 mg of total alkali, calculated as NaOH.

STORAGE

Store in an airtight, non-metallic container.

01/2005:1151

01/2005:0196

SODIUM IODIDE

Natrii iodidum

NaI

 M_r 149.9

DEFINITION

Sodium iodide contains not less than 99.0 per cent and not more than the equivalent of 100.5 per cent of NaI, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder or colourless crystals, hygroscopic, very soluble in water, freely soluble in alcohol.

IDENTIFICATION

- A. Solution S (see Tests) gives the reactions of iodides (2.3.1).
B. Solution S gives the reactions of sodium (2.3.1).

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Alkalinity. To 12.5 ml of solution S add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.7 ml of 0.01 M *hydrochloric acid* is required to change the colour of the indicator.

Iodates. To 10 ml of solution S add 0.25 ml of *iodide-free starch solution R* and 0.2 ml of *dilute sulphuric acid R* and allow to stand protected from light for 2 min. No blue colour develops.

Sulphates (2.4.13). 10 ml of solution S diluted to 15 ml with *distilled water R* complies with the limit test for sulphates (150 ppm).

Thiosulphates. To 10 ml of solution S add 0.1 ml of *starch solution R* and 0.1 ml of 0.005 M *iodine*. A blue colour is produced.

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution* (1 ppm Pb) R.

Iron (2.4.9). 5 ml of solution S diluted to 10 ml with *water R* complies with the limit test for iron (20 ppm).

Loss on drying (2.2.32). Not more than 3.0 per cent, determined on 1.00 g by drying in an oven at 100 °C to 105 °C for 3 h.

ASSAY

Dissolve 1.300 g in *water R* and dilute to 100.0 ml with the same solvent. To 20.0 ml of the solution add 40 ml of *hydrochloric acid R* and titrate with 0.05 M *potassium iodate* until the colour changes from red to yellow. Add 5 ml of *chloroform R* and continue the titration, shaking vigorously, until the chloroform layer is decolorised.

1 ml of 0.05 M *potassium iodate* is equivalent to 14.99 mg of NaI.

STORAGE

Store protected from light.

SODIUM LACTATE SOLUTION

Natrii lactatis solutio

DEFINITION

Solution of a mixture of the enantiomers of sodium 2-hydroxypropionate in approximately equal proportions.

Content: minimum 50.0 per cent *m/m* of sodium 2-hydroxypropionate ($C_3H_5NaO_3$; M_r 112.1); 96.0 per cent to 104.0 per cent of the content of sodium lactate stated on the label.

CHARACTERS

Appearance: clear, colourless, slightly syrupy liquid.

Solubility: miscible with water and with alcohol.

IDENTIFICATION

- A. To 0.1 ml add 10 ml of *water R*. 5 ml of the solution gives the reaction of lactates (2.3.1).
B. It gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dilute a quantity of the substance to be examined corresponding to 40.0 g of sodium lactate to 200 ml with *distilled water R*.

Appearance of solution. The substance to be examined is clear (2.2.1) and not more intensely coloured than reference solution BY₇ (2.2.2, *Method II*).

pH (2.2.3): 6.5 to 9.0 for the substance to be examined.

Reducing sugars and sucrose. To 5 ml of the substance to be examined add 2 ml of *dilute sodium hydroxide solution R* and 0.2 ml of *copper sulphate solution R*. The solution is clear and blue and remains so on boiling. Add to the hot solution 4 ml of *hydrochloric acid R*. Boil for 1 min. Add 6 ml of *strong sodium hydroxide solution R* and heat to boiling again. The solution is clear and blue.

Methanol. Gas chromatography (2.4.24).

Limit:

- *methanol*: maximum 50 ppm, calculated with reference to sodium lactate, if intended for use in the manufacture of parenteral dosage forms, dialysis, haemodialysis or haemofiltration solutions.

Chlorides (2.4.4): maximum 50 ppm calculated with reference to sodium lactate.

Dilute 5 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides.

Oxalates and phosphates. To 1 ml of the substance to be examined add 15 ml of *alcohol R* and 2 ml of *calcium chloride solution R*. Heat at 75 °C for 5 min. Any opalescence in the solution is not more intense than that of a standard prepared at the same time and in the same manner using a mixture of 1 ml of the substance to be examined, 15 ml of *alcohol R* and 2 ml of *water R*.

Sulphates (2.4.13): maximum 100 ppm calculated with reference to sodium lactate.

To 7.5 ml of solution S, add 1.9 ml of *hydrochloric acid R1* and dilute to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates without addition of 0.5 ml of *acetic acid R*. Acidify the standard solution with 0.05 ml of *hydrochloric acid R1* instead of 0.5 ml of *acetic acid R*.

01/2005:2033

Aluminium: maximum 0.1 ppm, if intended for use in the manufacture of parenteral dosage forms, dialysis, haemodialysis or haemofiltration solutions.

Atomic absorption spectrometry (2.2.23, *Method I*). For the preparation of the solutions, use equipment that is aluminium-free or that will not release aluminium under the conditions of use (glass, polyethylene, etc).

Modifier solution. Dissolve 100.0 g of *ammonium nitrate R* in a mixture of 50 ml of *water R* and 4 ml of *nitric acid R* and dilute to 200 ml with *water R*.

Blank solution. Dilute to 2.0 ml of the modifier solution to 25.0 ml with *water R*.

Test solution. To 1.25 g add 2.0 ml of the modifier solution and dilute to 25.0 ml with *water R*.

Reference solutions. Prepare the reference solutions immediately before use (0.010 ppm to 0.050 ppm of aluminium) using *aluminium standard solution (200 ppm Al) R*.

Source: aluminium hollow-cathode lamp.

Wavelength: 309.3 nm.

Atomisation device: a graphite furnace.

Carrier gas: argon *R*.

Conditions: the device is equipped with a non-specific absorption correction system. Heat the oven to 120 °C for as many seconds as there are microlitres of solution introduced into the apparatus, then heat at 1000 °C for 30 s and finally at 2700 °C for 6 s.

Barium. To 10 ml of solution S add 10 ml of *calcium sulphate solution R*. Allow to stand for 30 min. Any opalescence (2.2.1) in the solution is not more intense than that of a standard prepared at the same time and in the same manner using a mixture of 10 ml of solution S and 10 ml of *distilled water R*.

Iron (2.4.9): maximum 10 ppm calculated with reference to sodium lactate.

Dilute 5 ml of solution S to 10 ml with *water R*. The solution complies with the limit test for iron.

Heavy metals (2.4.8): maximum 10 ppm calculated with reference to sodium lactate.

12 ml of solution S complies with limit test A. Prepare the standard using *lead standard solution (2 ppm Pb) R*.

Bacterial endotoxins (2.6.14): less than 5 IU/g, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Dissolve a quantity of the substance to be examined corresponding to 75.0 mg of sodium lactate in a mixture of 10 ml of *glacial acetic acid R* and 20 ml of *acetic anhydride R*. Allow to stand for 15 min. Add 1 ml of *naphtholbenzein solution R* and titrate with 0.1 M *perchloric acid*.

1 ml of 0.1 M *perchloric acid* is equivalent to 11.21 mg of $C_3H_5NaO_3$.

LABELLING

The label states:

- where applicable, that the substance is suitable for use in the manufacture of dialysis, haemodialysis and haemofiltration solutions,
- where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms,
- the declared content of sodium lactate.

SODIUM (S)-LACTATE SOLUTION

Natrii (S)-lactatis solutio

DEFINITION

Content: minimum 50.0 per cent *m/m* of sodium (S)-2-hydroxypropanoate ($C_3H_5NaO_3$; M_r 112.1); 96.0 per cent to 104.0 per cent of the content of sodium lactate stated on the label, not less than 95.0 per cent of which is the (S)-enantiomer.

CHARACTERS

Appearance: clear, colourless, slightly syrupy liquid.

Solubility: miscible with water and with alcohol.

IDENTIFICATION

A. To 0.1 ml add 10 ml of *water R*. 5 ml of the solution gives the reaction of lactates (2.3.1).

B. It gives reaction (a) of sodium (2.3.1).

C. It complies with the limits of the assay.

TESTS

Solution S. Dilute a quantity of the substance to be examined corresponding to 40.0 g of sodium lactate to 200 ml with *distilled water R*.

Appearance of solution. The substance to be examined is clear (2.2.1) and not more intensely coloured than reference solution BY₇ (2.2.2, *Method II*).

pH (2.2.3): 6.5 to 9.0 for the substance to be examined.

Reducing sugars and sucrose. To 5 ml of the substance to be examined add 2 ml of *dilute sodium hydroxide solution R* and 0.2 ml of *copper sulphate solution R*. The solution is clear and blue and remains so on boiling. Add to the hot solution 4 ml of *hydrochloric acid R*. Boil for 1 min. Add 6 ml of *strong sodium hydroxide solution R* and heat to boiling again. The solution is clear and blue.

Methanol. Gas chromatography (2.4.24).

Limit:

- *methanol*: maximum 50 ppm, calculated with reference to sodium lactate, if intended for use in the manufacture of parenteral dosage forms, dialysis, haemodialysis or haemofiltration solutions.

Chlorides (2.4.4): maximum 50 ppm calculated with reference to sodium lactate.

Dilute 5 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides.

Oxalates and phosphates. To 1 ml of the substance to be examined add 15 ml of *alcohol R* and 2 ml of *calcium chloride solution R*. Heat at 75 °C for 5 min. Any opalescence in the solution is not more intense than that of a standard prepared at the same time and in the same manner using a mixture of 1 ml of the substance to be examined, 15 ml of *alcohol R* and 2 ml of *water R*.

Sulphates (2.4.13): maximum 100 ppm calculated with reference to sodium lactate.

To 7.5 ml of solution S, add 1.9 ml of *hydrochloric acid RI* and dilute to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates without addition of 0.5 ml of *acetic acid R*. Acidify the standard solution with 0.05 ml of *hydrochloric acid RI* instead of 0.5 ml of *acetic acid R*.

Aluminium: maximum 0.1 ppm, if intended for use in the manufacture of parenteral dosage forms, dialysis, haemodialysis or haemofiltration solutions.

Atomic absorption spectrometry (2.2.23, *Method I*). For the preparation of the solutions, use equipment that is aluminium-free or that will not release aluminium under the conditions of use (glass, polyethylene, etc).

Modifier solution. Dissolve 100.0 g of *ammonium nitrate R* in a mixture of 50 ml of *water R* and 4 ml of *nitric acid R* and dilute to 200 ml with *water R*.

Blank solution. Dilute 2.0 ml of the modifier solution to 25.0 ml with *water R*.

Test solution. To 1.25 g add 2.0 ml of the modifier solution and dilute to 25.0 ml with *water R*.

Reference solutions. Prepare the reference solutions immediately before use (0.010 ppm to 0.050 ppm of aluminium) using *aluminium standard solution (200 ppm Al) R*.

Source: aluminium hollow-cathode lamp.

Wavelength: 309.3 nm.

Atomisation device: a graphite furnace.

Carrier gas: argon *R*.

Conditions: the device is equipped with a non-specific absorption correction system. Heat the oven to 120 °C for as many seconds as there are microlitres of solution introduced into the apparatus, then heat at 1000 °C for 30 s and finally at 2700 °C for 6 s.

Barium. To 10 ml of solution S add 10 ml of *calcium sulphate solution R*. Allow to stand for 30 min. Any opalescence (2.2.1) in the solution is not more intense than that of a standard prepared at the same time and in the same manner using a mixture of 10 ml of solution S and 10 ml of *distilled water R*.

Iron (2.4.9): maximum 10 ppm calculated with reference to sodium lactate.

Dilute 5 ml of solution S to 10 ml with *water R*. The solution complies with the limit test for iron.

Heavy metals (2.4.8): maximum 10 ppm calculated with reference to sodium lactate.

12 ml of solution S complies with limit test A. Prepare the standard using *lead standard solution (2 ppm Pb) R*.

Bacterial endotoxins (2.6.14): less than 5 IU/g if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Dissolve a quantity of the substance to be examined corresponding to 75.0 mg of sodium lactate in a mixture of 10 ml of *glacial acetic acid R* and 20 ml of *acetic anhydride R*. Allow to stand for 15 min. Add 1 ml of *naphtholbenzein solution R* and titrate with 0.1 M *perchloric acid*.

1 ml of 0.1 M *perchloric acid* is equivalent to 11.21 mg of $C_3H_5NaO_3$.

(S)-enantiomer. Transfer a quantity of the substance to be examined corresponding to 2.50 g of sodium lactate into a 50 ml volumetric flask, dilute with about 30 ml of *water R* and add 5.0 g of *ammonium molybdate R*. Dissolve and dilute with *water R* to 50.0 ml. Measure the angle of optical rotation (2.2.7). Calculate the percentage content of (S)-enantiomer using the expression:

$$50 + \left(24.04 \times \alpha \times \frac{5.0}{m} \times \frac{50}{c} \right)$$

α = angle of optical rotation (absolute value),

m = mass of the substance to be examined, in grams,

c = percentage content of $C_3H_5NaO_3$ in the substance to be examined.

The complex of sodium (S)-lactate formed under these test conditions is leavorotatory.

LABELLING

The label states:

- where applicable, that the substance is suitable for use in the manufacture of dialysis, haemodialysis and haemofiltration solutions,
- where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms,
- the declared content of sodium lactate.

01/2005:0098

SODIUM LAURILSULFATE

Natrii laurilsulfas

DEFINITION

Sodium laurilsulfate is a mixture of sodium alkyl sulphates consisting chiefly of sodium dodecyl sulphate, $C_{12}H_{25}NaO_4S$ (M_r 288.4). It contains not less than 85.0 per cent of sodium alkyl sulphates, calculated as $C_{12}H_{25}NaO_4S$.

CHARACTERS

A white or pale yellow powder or crystals, freely soluble in water giving an opalescent solution, partly soluble in alcohol.

IDENTIFICATION

- Dissolve 0.1 g in 10 ml of *water R* and shake. A copious foam is formed.
- To 0.1 ml of the solution prepared for identification test A, add 0.1 ml of a 1 g/l solution of *methylene blue R* and 2 ml of *dilute sulphuric acid R*. Add 2 ml of *methylene chloride R* and shake. An intense blue colour develops in the methylene chloride layer.
- Mix about 10 mg with 10 ml of *ethanol R*. Heat to boiling on a water-bath, shaking frequently. Filter immediately and evaporate the ethanol. Dissolve the residue in 8 ml of *water R*, add 3 ml of *dilute hydrochloric acid R*, evaporate the solution to half its volume and allow to cool. Separate the congealed fatty alcohols by filtration. To the filtrate add 1 ml of *barium chloride solution R1*. A white, crystalline precipitate is formed.
- Ignite 0.5 g. The residue gives reaction (a) of sodium (2.3.1).

TESTS

Alkalinity. Dissolve 1.0 g in 100 ml of *carbon dioxide-free water R* and add 0.1 ml of *phenol red solution R*. Not more than 0.5 ml of 0.1 M *hydrochloric acid* is required to change the colour of the indicator.

Non-esterified alcohols. Dissolve 10 g in 100 ml of *water R*, add 100 ml of *alcohol R* and shake the solution with 3 quantities, each of 50 ml, of *pentane R*, adding *sodium chloride R*, if necessary, to promote separation of the 2 layers. Wash the combined organic layers with 3 quantities, each of 50 ml, of *water R*, dry over *anhydrous sodium sulphate R*, filter and evaporate on a water-bath until the

solvent has evaporated. Heat the residue at 105 °C for 15 min and cool. The residue weighs not more than 0.4 g (4 per cent).

Sodium chloride and sodium sulphate. Not more than a total of 8.0 per cent of NaCl and Na₂SO₄.

Sodium chloride. Dissolve 5.00 g in 50 ml of *water R*, add *dilute nitric acid R* dropwise until the solution is neutral to *blue litmus paper R*, add 2 ml of *potassium chromate solution R* and titrate with 0.1 M *silver nitrate*.

1 ml of 0.1 M *silver nitrate* is equivalent to 5.844 mg of NaCl.

Sodium sulphate. Dissolve 0.500 g in 20 ml of *water R*, warming gently if necessary, and add 1 ml of a 0.5 g/l solution of *dithizone R1* in *acetone R*. If the solution is red, add 1 M *nitric acid*, dropwise, until the solution becomes bluish-green. Add 2.0 ml of *dichloroacetic acid solution R* and 80 ml of *acetone R*. Titrate with 0.01 M *lead nitrate* until a persistent violet-red or orange-red colour is obtained. Carry out a blank titration.

1 ml of 0.01 M *lead nitrate* is equivalent to 1.420 mg of Na₂SO₄.

ASSAY

Dissolve 1.15 g in *water R*, warming if necessary, and dilute to 1000.0 ml with the same solvent. To 20.0 ml of the solution add 15 ml of *chloroform R* and 10 ml of *dimidium bromide-sulphan blue mixed solution R*. Titrate with 0.004 M *benzethonium chloride*, shaking vigorously and allowing the layers to separate before each addition, until the pink colour of the chloroform layer is completely discharged and a greyish-blue colour is obtained.

1 ml of 0.004 M *benzethonium chloride* is equivalent to 1.154 mg of sodium alkyl sulphates, calculated as C₁₂H₂₅NaO₄S.

01/2005:0849

SODIUM METABISULPHITE

Natrii metabisulfis

Na₂S₂O₅*M*_r 190.1

DEFINITION

Sodium metabisulphite (sodium disulphite) contains not less than 95.0 per cent and not more than the equivalent of 100.5 per cent of Na₂S₂O₅.

CHARACTERS

A white or almost white, crystalline powder or colourless crystals, freely soluble in water, slightly soluble in alcohol.

IDENTIFICATION

- Solution S (see Tests) complies with the test for pH (see Tests).
- To 0.4 ml of *iodinated potassium iodide solution R* add 8 ml of *distilled water R* and 1 ml of a 1 to 10 dilution of solution S in *distilled water R*. The solution is colourless and gives reaction (a) of sulphates (2.3.1).
- Solution S gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 3.5 to 5.0.

Thiosulphates. To 5 ml of solution S add 5 ml of *dilute hydrochloric acid R*. The solution remains clear (2.2.1) for not less than 15 min.

Arsenic (2.4.2). Mix 0.20 g with 2 ml of *water R* in a dish. Add, drop by drop, 1.5 ml of *nitric acid R*. Evaporate the mixture to dryness on a water-bath. Heat over a flame until no more vapour is evolved. Take up the residue in 25 ml of *water R*. The solution complies with limit test A for arsenic (5 ppm).

Iron (2.4.9). 10 ml of solution S complies with the limit test for iron (20 ppm).

Heavy metals (2.4.8). To 40 ml of solution S in a silica crucible, add 10 ml of *hydrochloric acid R* and evaporate to dryness. Dissolve the residue in 19 ml of *water R* and add 1 ml of a 40 g/l solution of *sodium fluoride R*. 12 ml of the solution complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution* (2 ppm Pb) R.

ASSAY

Dissolve 0.200 g in 50.0 ml of 0.05 M *iodine*. Add 5 ml of *dilute hydrochloric acid R*. Titrate with 0.1 M *sodium thiosulphate* using 1 ml of *starch solution R*, added towards the end of the titration, as indicator.

1 ml of 0.05 M *iodine* is equivalent to 4.753 mg of Na₂S₂O₅.

STORAGE

Store protected from light.

01/2005:1262

SODIUM METHYL PARAHYDROXYBENZOATE

Methylis parahydroxybenzoas natricum

C₈H₇NaO₃*M*_r 174.1

DEFINITION

Sodium methyl parahydroxybenzoate contains not less than 99.0 per cent and not more than the equivalent of 102.0 per cent of sodium 4-(methoxycarbonyl)phenolate, calculated with reference to the anhydrous substance.

CHARACTERS

A white, crystalline powder, freely soluble in water, sparingly soluble in alcohol, practically insoluble in methylene chloride.

IDENTIFICATION

First identification: A, B, E.

Second identification: A, C, D, E.

- Dissolve 0.5 g in 50 ml of *water R*. Immediately add 5 ml of *hydrochloric acid R1*. Filter and wash the precipitate with *water R*. Dry under vacuum at 80 °C for 2 h. The precipitate obtained melts (2.2.14) at 125 °C to 128 °C.
- Examine the precipitate obtained in identification test A by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *methyl parahydroxybenzoate CRS*.

- C. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (c).
- D. To about 10 mg in a test-tube add 1 ml of *sodium carbonate solution R*, boil for 30 s and cool. Add 5 ml of *aminopyrazolone solution R* and 1 ml of *potassium ferricyanide solution R* and mix. An orange to red colour develops.
- E. To 1 ml of solution S (see Tests) add 1 ml of *water R*. The solution gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S examined immediately after preparation is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, Method I).

pH (2.2.3). Dilute 1 ml of solution S to 100 ml with *carbon dioxide-free water R*. The pH of the solution is 9.5 to 10.5.

Related substances. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable octadecylsilyl silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution (a). Dissolve 0.100 g in 10 ml of *water R*. Immediately add 2 ml of *hydrochloric acid R* and shake with 50 ml of *ether R*. Evaporate the upper layer to dryness and dissolve the residue to 10 ml with *acetone R*.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *acetone R*.

Reference solution (a). Dissolve 34.3 mg of *4-hydroxybenzoic acid R* in *acetone R* and dilute to 100 ml with the same solvent.

Reference solution (b). Dilute 0.5 ml of test solution (a) to 100 ml with *acetone R*.

Reference solution (c). Dissolve 10 mg of *methyl parahydroxybenzoate CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (d). Dissolve 10 mg of *ethyl parahydroxybenzoate CRS* in 1 ml of test solution (a) and dilute to 10 ml with *acetone R*.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 1 volume of *glacial acetic acid R*, 30 volumes of *water R* and 70 volumes of *methanol R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. In the chromatogram obtained with test solution (a): any spot due to 4-hydroxybenzoic acid is not more intense than the spot in the chromatogram obtained with reference solution (a) (4 per cent) and any spot, apart from the principal spot and the spot due to 4-hydroxybenzoic acid, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (d) shows two clearly separated principal spots.

Chlorides (2.4.4). To 10 ml of solution S, add 30 ml of *water R* and 1 ml of *nitric acid R* and dilute to 50 ml with *water R*. Shake and filter. Dilute 10 ml of the filtrate to 15 ml with *water R*. The solution complies with the limit test for chlorides (350 ppm). Prepare the standard using 14 ml of *chloride standard solution (5 ppm Cl) R* to which 1 ml of *water R* has been added.

Sulphates (2.4.13). To 25 ml of solution S, add 5 ml of *distilled water R* and 10 ml of *hydrochloric acid R* and dilute to 50 ml with *distilled water R*. Shake and filter. Dilute 10 ml of the filtrate to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (300 ppm).

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (2.5.12). Not more than 5.0 per cent, determined on 0.500 g by the semi-micro determination of water.

ASSAY

Dissolve 0.150 g in 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 17.41 mg of C₈H₇NaO₃.

IMPURITIES

- A. R = H: 4-hydroxybenzoic acid,
 B. R = CH₂-CH₃: ethyl 4-hydroxybenzoate,
 C. R = CH₂-CH₂-CH₃: propyl 4-hydroxybenzoate,
 D. R = CH₂-CH₂-CH₂-CH₃: butyl 4-hydroxybenzoate.

01/2005:1565

SODIUM MOLYBDATE DIHYDRATE

Natrii molybdatas dihydricus

Na₂MoO₄·2H₂OM_r 241.9

DEFINITION

Sodium molybdate dihydrate contains not less than 98.0 per cent and not more than the equivalent of 100.5 per cent of Na₂MoO₄, calculated with reference to the dried substance.

CHARACTERS

A white powder or colourless crystals, freely soluble in water.

IDENTIFICATION

- A. It complies with the test for loss on drying (see Tests).
 B. Dissolve 0.2 g in 5 ml of a mixture of equal volumes of *nitric acid R* and *water R* and add 0.1 g of *ammonium chloride R*. Add 0.3 ml of *disodium hydrogen phosphate solution R* and heat slowly at 50 °C to 60 °C. A yellow precipitate is formed.
 C. Dissolve 0.15 g in 2 ml of *water R*, the solution gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 10.0 g in *water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, Method II).

Chlorides. To 10 ml of a mixture of equal volumes of *nitric acid R* and *water R* add 10 ml of solution S with shaking. Add 1 ml of 0.1 M *silver nitrate*. Any opalescence in the solution is not more intense after 5 min than that of a

standard solution prepared at the same time in the same manner with 2 ml of *chloride standard solution* (50 ppm Cl) R (50 ppm).

Phosphates. Dissolve 2.0 g by heating in 13 ml of *water R*. In the still hot solution, dissolve 8.0 g of *ammonium nitrate R1*. Add this solution to 27 ml of a mixture of equal volumes of *nitric acid R* and *water R*. Any yellow colour or opalescence in the solution is not more intense within 3 h than that in a standard solution prepared at the same time as follows: dissolve 1.0 g in 12 ml of *water R* and add 1 ml of *phosphate standard solution* (200 ppm PO₄) R (200 ppm).

Ammonium (2.4.1). 0.10 g complies with limit test B for ammonium (10 ppm). Prepare the standard using 1 ml of *ammonium standard solution* (1 ppm NH₄) R.

Heavy metals. To 10 ml of solution S, add 2 ml of *water R*, 6 ml of a 168 g/l solution of *sodium hydroxide R* and 2 ml of *concentrated ammonia R* (solution A). To 0.5 ml of *thioacetamide reagent R* add a mixture of 15 ml of solution A and 5 ml of *water R*. Any coloration of the solution is not more intense after 2 min than that of a standard solution prepared at the same time as follows: to 0.5 ml of *thioacetamide reagent R* add a mixture of 5 ml of solution A, 1 ml of *lead standard solution* (10 ppm Pb) R and 14 ml of *water R* (10 ppm).

Loss on drying (2.2.32): 14.0 per cent to 16.0 per cent, determined on 1.000 g by drying in an oven at 140 °C for 3 h.

ASSAY

Dissolve 0.100 g in 30 ml of *water R*, add 0.5 g of *hexamethylenetetramine R* and 0.1 ml of a 250 g/l solution of *nitric acid R*. Heat to 60 °C. Titrate with 0.05 M *lead nitrate* using 4-(2-pyridylazo)resorcinol monosodium salt R as indicator.

1 ml of 0.05 M *lead nitrate* is equivalent to 10.30 mg of Na₂MoO₄.

01/2005:1996

SODIUM NITRITE

Natrii nitris

NaNO₂*M_r* 69.0

DEFINITION

Content: 98.5 per cent to 100.5 per cent (dried substance).

CHARACTERS

Appearance: colourless crystals or mass or yellowish rods, hygroscopic.

Solubility: freely soluble in water, soluble in alcohol.

IDENTIFICATION

- Dilute 1 ml of solution S1 (see Tests) to 25 ml with *water R*. To 0.1 ml of the solution add 1 ml of *sulphanilic acid solution R1*. Allow to stand for 2-3 min. Add 1 ml of *β-naphthol solution R* and 1 ml of *dilute sodium hydroxide solution R*. An intense red colour develops.
- To 1 ml of the solution prepared for identification test A add 3 ml of a 20 g/l solution of *phenazone R* and 0.4 ml of *dilute sulphuric acid R*. An intense green colour develops.
- To 0.15 ml of solution S1, add 0.35 ml of *water R*. The solution gives reaction (b) of sodium (2.3.1).

TESTS

Solution S1. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Solution S2. Dissolve 3 g in *distilled water R*. Cautiously add 10 ml of *nitric acid R* and evaporate to dryness. Dissolve the residue in 10 ml of *distilled water R*, neutralise with *dilute sodium hydroxide solution R* and dilute to 30 ml with *distilled water R*.

Appearance of solution. Solution S1 is clear (2.2.1) and not more intensely coloured than reference solution B₆ (2.2.2, Method II).

Acidity or alkalinity. To 10 ml of solution S1, add 0.05 ml of *phenol red solution R*. Add 0.1 ml of 0.01 M *sodium hydroxide*. The solution is red. Add 0.3 ml of 0.01 M *hydrochloric acid*. The solution is yellow.

Chlorides (2.4.4): maximum 50 ppm.

Dilute 10 ml of solution S2 to 15 ml with *water R*. The solution complies with the limit test for chlorides.

Sulphates (2.4.13): maximum 200 ppm.

Dilute 7.5 ml of solution S2 to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates.

Heavy metals (2.4.8): maximum 20 ppm.

Dilute 10 ml of solution S2 to 20 ml with *water R*. 12 ml of the solution complies with limit test A. Prepare the standard using *lead standard solution* (1 ppm Pb) R.

Loss on drying (2.2.32): maximum 1.0 per cent, determined on 1.000 g by drying *in vacuo*.

ASSAY

Dissolve 0.400 g in 100.0 ml of *water R*. Introduce 20.0 ml of the solution, while stirring continuously and keeping the tip of the pipette below the surface of the liquid, into a conical flask containing 30.0 ml of 0.1 M *cerium sulphate*. Immediately stopper the flask and allow to stand for 2 min. Add 10 ml of a 200 g/l solution of *potassium iodide R* and 2 ml of *starch solution R*.

While stirring continuously, titrate with 0.1 M *sodium thiosulphate* until the blue colour disappears. Carry out a blank titration.

1 ml of 0.1 M *cerium sulphate* is equivalent to 3.45 mg of NaNO₂.

STORAGE

In an airtight container.

01/2005:0565

SODIUM NITROPRUSSIDE

Natrii nitroprussias

Na₂[Fe(CN)₅NO]·2H₂O*M_r* 298.0

DEFINITION

Sodium nitroprusside contains not less than 99.0 per cent and not more than the equivalent of 100.5 per cent of sodium pentacyanonitrosylferrate (III), calculated with reference to the anhydrous substance.

CHARACTERS

Reddish-brown powder or crystals, freely soluble in water, slightly soluble in alcohol.

IDENTIFICATION

- A. Dissolve 0.700 g in *water R* and dilute to 100.0 ml with the same solvent. Examined between 350 nm and 600 nm (2.2.25) immediately after preparation, the solution shows an absorption maximum at 395 nm, a shoulder at about 510 nm and a minimum at 370 nm. The specific absorbance at the maximum is 0.65 to 0.80.
- B. Dissolve about 20 mg in 2 ml of *water R* and add 0.1 ml of *sodium sulphide solution R*. A deep violet-red colour is produced.
- C. Dissolve 50 mg in 1 ml of *water R* and acidify the solution by the addition of *hydrochloric acid R*. Place a drop of the solution in an oxidising flame. A persistent yellow colour is produced.

TESTS

Insoluble matter. Dissolve 10 g without heating in 50 ml of *water R*. Allow to stand for 30 min and filter through a sintered-glass filter (16). Wash the filter with cold *water R* until the filtrate is colourless. Dry the residue on the filter at 105 °C. The residue weighs not more than 1 mg (100 ppm).

Chlorides (2.4.4). In a metallic crucible (nickel) mix 1.0 g of the substance to be examined with 8 ml of a 200 g/l solution of *sodium hydroxide R*. Heat slowly and evaporate carefully to dryness over a small flame, then heat to a dull red colour for 30 min. Allow to cool and transfer the solid residue with three successive portions, each of 8 ml of *dilute sulphuric acid R*. Filter the sulphuric acid extracts on a filter paper and collect the filtrates. Render the filtrate acid to *litmus paper R* by adding, if necessary, a few drops of *dilute sulphuric acid R*. Wash the crucible and the filter paper with three successive portions of 10 ml of *water R*, add the washings to the main sulphuric acid solution and dilute to 60 ml with *water R*. Mix. 15 ml of the solution complies with the limit test for chlorides (200 ppm).

Ferricyanides. Dissolve 1.25 g in *acetate buffer solution pH 4.6 R* and dilute to 50.0 ml with the same buffer solution. Use three 50 ml volumetric flasks (A, B, C). To flask B add 1.0 ml of *ferricyanide standard solution (50 ppm Fe(CN)₆ R*. To flasks A and B add 1 ml of a 5 g/l solution of *ferrous ammonium sulphate R*. To the three flasks add 10.0 ml of the solution of the substance to be examined. Dilute the contents of each flask to 50.0 ml with *water R*. Allow to stand for 30 min. The absorbance (2.2.25) of the solution in flask A measured at 720 nm using the solution in flask C as the compensation liquid is not greater than the absorbance of the solution in flask B measured at 720 nm using the solution in flask A as the compensation liquid (200 ppm).

Ferrocyanides. Dissolve 4.0 g in *water R* and dilute to 100.0 ml with the same solvent. Use three 50 ml volumetric flasks (A, B, C). To flask B add 2.0 ml of *ferrocyanide standard solution (100 ppm Fe(CN)₆ R*. To flasks A and B add 1 ml of *ferric chloride solution R2*. To the three flasks add 25.0 ml of the solution of the substance to be examined. Dilute the contents of each flask to 50.0 ml with *water R*. Allow to stand for 30 min. The absorbance (2.2.25) of the solution in flask A measured at 695 nm using the solution in flask C as the compensation liquid is not greater than the absorbance of the solution in flask B measured at 695 nm using the solution in flask A as the compensation liquid (200 ppm).

Sulphates. For the preparation and dilution of the solutions use *distilled water R*.

Test solution. Dissolve 3.6 g in 120 ml of water, add with mixing 4 ml of *sulphate standard solution (10 ppm SO₄ R* and 20 ml of a 250 g/l solution of *cupric chloride R* and

dilute to 150.0 ml with water. Allow to stand for 16 h and filter or centrifuge until a clear light-blue solution is obtained.

Reference solution. To 40 ml of *sulphate standard solution (10 ppm SO₄ R* add 80 ml of water and 12 ml to 13 ml of a 250 g/l solution of *cupric chloride R*. Dilute to 150.0 ml with water. The volume of cupric chloride solution added is such that the colour of the final solution matches that of the test solution.

Allow the solutions to stand. Filter both solutions, discarding the first 25 ml of filtrate. To 100 ml of each filtrate, add 0.5 ml of *acetic acid R*. Mix and add 2 ml of a 250 g/l solution of *barium chloride R* and mix again. The test solution is not more opalescent than the reference solution (100 ppm).

Water (2.5.12): 9.0 per cent to 15.0 per cent, determined on 0.250 g by the semi-micro determination of water.

ASSAY

Dissolve 0.250 g in 100 ml of *water R* and add 0.1 ml of *dilute sulphuric acid R*. Titrate with 0.1 M *silver nitrate*, determining the end-point potentiometrically (2.2.20) with a silver-mercurous sulphate electrode system.

1 ml of 0.1 M *silver nitrate* is equivalent to 13.10 mg of Na₂[Fe(CN)₅NO].

STORAGE

Store protected from light.

01/2005:1997

SODIUM PERBORATE, HYDRATED

Natrii perboras hydricus

NaBO₃·4H₂O or NaBO₂·H₂O₂·3H₂O

M_r 153.9

DEFINITION

Content: 96.0 per cent to 103.0 per cent.

CHARACTERS

Appearance: colourless, prismatic crystals or white powder, stable in the crystalline form.

Solubility: sparingly soluble in water, with slow decomposition. It dissolves in dilute mineral acids.

IDENTIFICATION

- A. Mix 1 ml of a saturated solution with a mixture of 1 ml of *dilute sulphuric acid R* and 0.2 ml of a 70 g/l solution of *potassium dichromate R*, shake with 2 ml of *ether R* and allow to stand. A blue colour is produced in the ether layer.
- B. The mixture obtained by treating about 100 mg with 0.1 ml of *sulphuric acid R* and 5 ml of *methanol R* burns with a greenish flame when ignited.
- C. It gives reaction (a) of sodium (2.3.1).

TESTS

Chlorides (2.4.4): maximum 330 ppm.

Dissolve 0.15 g in 15 ml of *water R*. The solution complies with the limit test for chlorides.

Sulphates (2.4.13): maximum 1.2 per cent.

Dissolve 0.13 g in 150 ml of *distilled water R*. 15 ml of the solution complies with the limit test for sulphates.

Iron (2.4.9): maximum 20 ppm.

Dissolve 2.5 g in 10 ml of *dilute hydrochloric acid R* with heating, evaporate to dryness, with stirring, and dissolve the residue in 25 ml of hot *water R*. Dilute 5 ml of the obtained solution to 10 ml with *water R*. The solution complies with the limit test for iron.

Heavy metals (2.4.8): maximum 10 ppm.

12 ml of the solution obtained in the test for iron complies with limit test A. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

ASSAY

Dissolve 0.300 g in 50.0 ml of *water R*. Dilute 10.0 ml of the solution to 50 ml with *water R* and add 10 ml of *dilute sulphuric acid R*. Titrate with 0.02 M *potassium permanganate*.

1 ml of 0.02 M *potassium permanganate* is equivalent to 7.693 mg of NaH_8BO_7 .

STORAGE

In an airtight container.

01/2005:1031

SODIUM PICOSULFATE

Natrii picosulfas

$\text{C}_{18}\text{H}_{13}\text{NNa}_2\text{O}_8\text{S}_2 \cdot \text{H}_2\text{O}$

M_r 499.4

DEFINITION

Sodium picosulfate contains not less than 98.5 per cent and not more than the equivalent of 100.5 per cent of 4,4'-(pyridin-2-ylmethylene)bisphenyl bis(sodium sulphate), calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, freely soluble in water, slightly soluble in alcohol.

IDENTIFICATION

First identification: A, E.

Second identification: B, C, D, E.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *sodium picosulfate CRS*. Examine the substances prepared as discs.
- Examine the chromatograms obtained in the test for related substances in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).
- To 5 ml of solution S (see Tests) add 1 ml of *dilute hydrochloric acid R* and heat to boiling. Add 1 ml of *barium chloride solution R1*. A white precipitate is formed.

D. To about 10 mg add 3 ml of *sulphuric acid R* and 0.1 ml of *potassium dichromate solution R1*. A violet colour develops.

E. The solution S gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 2.5 g in *distilled water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution GY₇ (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.05 ml of *phenolphthalein solution R*. The solution is colourless. Not more than 0.25 ml of 0.01 M *sodium hydroxide* is required to change the colour of the indicator to pink.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution (a). Dissolve 0.20 g of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methanol R*.

Reference solution (a). Dissolve 20 mg of *sodium picosulfate CRS* in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dilute 2 ml of test solution (b) to 100 ml with *methanol R*.

Reference solution (c). Dissolve 0.20 g of the substance to be examined in 2 ml of a 103 g/l solution of *hydrochloric acid R*. Heat rapidly to boiling and maintain boiling for 10 s. Cool in iced water and dilute to 10 ml with *methanol R*.

Apply to the plate 5 µl of each solution. Develop over a path of 10 cm using a mixture of 2.5 volumes of *anhydrous formic acid R*, 12.5 volumes of *water R*, 25 volumes of *methanol R* and 60 volumes of *ethyl acetate R*. Dry the plate in a current of hot air for 15 min and examine in ultraviolet light at 254 nm. Spray with a 200 g/l solution of *hydrochloric acid R* in *methanol R* and heat at 110 °C for 10 min. Spray the hot plate with a freshly prepared solution containing 50 g/l of *ferric chloride R* and 1 g/l of *potassium ferricyanide R*. Examine the wet plate. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows three clearly separated spots. A fourth spot may be present on the starting-line.

Chlorides (2.4.4). Dilute 5 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides (200 ppm).

Sulphates (2.4.13). Dilute 7.5 ml of solution S to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (400 ppm).

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (20 ppm). Prepare the standard using 10 ml of *lead standard solution (1 ppm Pb) R*.

Water (2.5.12): 3.0 per cent to 5.0 per cent, determined on 0.500 g by the semi-micro determination of water.

ASSAY

Dissolve 0.400 g in 80 ml of *methanol R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 48.14 mg of $\text{C}_{18}\text{H}_{13}\text{NNa}_2\text{O}_8\text{S}_2$.

IMPURITIES

- A. R = SO₃Na: 4-[(pyridin-2-yl)(4-hydroxyphenyl)methyl]phenyl sodium sulphate,
 B. R = H: 4,4'-[(pyridin-2-yl)methylene]bisphenol.

SODIUM POLYSTYRENE SULPHONATE

Natrii polystyrenesulfonas

DEFINITION

Polystyrene sulphonate resin prepared in the sodium form.

Exchange capacity: 2.8 mmol to 3.4 mmol of potassium per gram (dried substance).

Content: 9.4 per cent to 11.0 per cent of Na (dried substance).

CHARACTERS

Appearance: almost white or light brown powder.

Solubility: practically insoluble in water, in alcohol and in methylene chloride.

IDENTIFICATION

- A. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs using finely ground substance.

Comparison: Ph. Eur. reference spectrum of sodium polystyrene sulphonate.

- B. Suspend 0.1 g in *water R*, add 2 ml of a 150 g/l solution of *potassium carbonate R*, and heat to boiling. Allow to cool and filter. To the filtrate add 4 ml of *potassium pyroantimonate solution R* and heat to boiling. Allow to cool in iced water and if necessary rub the inside of the test-tube with a glass rod. A dense white precipitate is formed.

TESTS

Styrene. Liquid chromatography (2.2.29).

Test solution. Shake 10.0 g of the substance to be examined with 10 ml of *acetone R* for 30 min, centrifuge and use the supernatant liquid.

Reference solution. Dissolve 10 mg of *styrene R* in *acetone R* and dilute to 100 ml with the same solvent. Dilute 1 ml of this solution to 100 ml with *acetone R*.

Column:

- *size*: $l = 0.25$ m, $\varnothing = 4$ mm,
- *stationary phase*: octadecylsilyl silica gel for chromatography *R* (5 μ m).

Mobile phase: acetonitrile *R*, *water R* (1:1 V/V).

Flow rate: 2 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 μ l.

Limit:

- *styrene*: not more than the area of the principal peak in the chromatogram obtained with the reference solution (1 ppm).

Calcium: maximum 0.10 per cent.

Atomic emission spectrometry (2.2.22, *Method I*).

Test solution. To 1.10 g add 5 ml of *hydrochloric acid R*, heat to boiling, cool and add 10 ml of *water R*. Filter, wash the filter and residue with *water R* and dilute the filtrate and washing to 25.0 ml with *water R*.

Reference solutions. Prepare the reference solutions using *calcium standard solution (400 ppm Ca) R*, diluted as necessary with *water R*.

Wavelength: 422.7 nm.

Potassium: maximum 0.10 per cent.

Atomic emission spectrometry (2.2.22, *Method I*).

Test solution. To 1.10 g add 5 ml of *hydrochloric acid R*, heat to boiling, cool and add 10 ml of *water R*. Filter, wash the filter and residue with *water R* and dilute the filtrate and washings to 25.0 ml with *water R*.

Reference solutions. Prepare the reference solutions using *potassium standard solution (100 ppm K) R*, diluted as necessary with *water R*.

Wavelength: 766.5 nm.

Heavy metals (2.4.8): maximum 10 ppm.

Treat 1.0 g as described in limit test F. After the addition of the *buffer solution pH 3.5 R* and of the *thioacetamide reagent R*, dilute to 50 ml with *water R* and continue as described in limit test E, beginning at the words “mix and allow to stand for 10 min...”.

Prepare the standard using 10 ml of *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32): maximum 7.0 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Microbial contamination (2.6.13): not more than 10² enterobacteria and certain other gram-negative bacteria per gram.

ASSAY

Sodium. Atomic emission spectrometry (2.2.22, *Method I*).

Test solution. In a platinum crucible moisten 0.90 g with a few drops of *sulphuric acid R*, ignite very gently and allow to cool. Moisten with a few drops of *sulphuric acid R* again, ignite at 800 °C until a carbon-free ash is obtained and allow to cool.

Add 20 ml of *water R* to the crucible, warm gently on a water-bath until dissolution, cool, transfer quantitatively to a 100 ml graduated flask and dilute to 100.0 ml with *water R*. Dilute 5 ml of this solution to 1000.0 ml with *water R*.

Reference solutions. Prepare the reference solutions using *sodium standard solution (200 ppm Na) R*, diluted as necessary with *water R*.

Wavelength: 589 nm.

Exchange capacity. Atomic emission spectrometry (2.2.22, *Method I*).

Solution A. 9.533 g/l solution of *potassium chloride R*.

Test solution. To 1.6 g of the substance to be examined in a dry 250 ml ground-glass-stoppered flask add 100 ml of solution A, stopper and shake for 15 min. Filter, discard the first 20 ml of the filtrate and dilute 4 ml of the filtrate to 1000 ml with *water R*.

Reference solutions. Prepare the reference solutions by diluting 0, 1, 2, 3 and 4 ml of solution A respectively and 4, 3, 2, 1 and 0 ml of a 7.63 g/l solution of *sodium chloride R* to 1000 ml with *water R*.

Wavelength: 766.5 nm.

Prepare a calibration curve using the reference solutions and calculate the potassium exchange capacity of the substance to be examined in millimoles per gram taking the concentration of potassium in solution A as 128 mmoles of K per litre.

STORAGE

In an airtight container.

IMPURITIES

Specified impurities: A.

A. styrene.

01/2005:2041

SODIUM PROPIONATE

Natrii propionas

$C_3H_5NaO_2$

M_r 96.1

DEFINITION

Sodium propanoate.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: colourless crystals or white powder, slightly hygroscopic.

Solubility: freely soluble in water, sparingly soluble in alcohol, practically insoluble in methylene chloride.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of sodium propionate.

B. Dissolve 0.1 g in a mixture of 2 ml of *copper sulphate solution R* and 2 ml of *methylene chloride R*. Shake vigorously and allow to stand. Both the upper and the lower layer show a blue colour.

C. To 5 ml of solution S (see Tests) add 2 ml of 0.1 M *silver nitrate*. A white precipitate is formed.

D. Solution S gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 10 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3): 7.8 to 9.2.

Dilute 1 ml of solution S to 5 ml with *water R*.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.250 g of the substance to be examined in *water R* and dilute to 100 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of the substance to be examined and 10 mg of *sodium acetate R* in *water R* and dilute to 100 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 100 ml with *water R*.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: octadecylsilyl silica gel for chromatography R (5 μ m).

Mobile phase: dilute 1 ml of *phosphoric acid R* to 1000 ml with *water R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 20 μ l.

System suitability: reference solution (a):

- resolution: minimum 5 between the peaks due to sodium acetate and sodium propionate.

Limits:

- any impurity: not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- total: not more than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
- disregard limit: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Readily oxidisable substances. In a ground-glass-stoppered conical flask introduce 10 g of the substance to be examined. Add 100 ml of *water R* and stir to dissolve. Add 25 ml of *sodium hypobromite solution R* and 10 ml of a 200 g/l solution of *sodium acetate R*, stopper the flask and allow to stand for 15 min. Add 10 ml of *potassium iodide solution R* and 20 ml of *hydrochloric acid R* while cooling. Titrate with 0.2 M *sodium thiosulphate*, adding 2 ml of *starch solution R* towards the end of the titration. Carry out a blank titration. The difference between the volumes used in the 2 titrations is not greater than 2.2 ml.

Iron (2.4.9): maximum 10 ppm.

10 ml of solution S complies with the limit test for iron.

Heavy metals (2.4.8): maximum 10 ppm.

12 ml of solution S complies with limit test A. Prepare the standard using *lead standard solution* (1 ppm Pb) R.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by heating in an oven at 100–105 °C for 3 h.

ASSAY

Dissolve 80.0 mg in 30 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 9.61 mg of $C_3H_5NaO_2$.

STORAGE

In an airtight container.

01/2005:1263

SODIUM PROPYL PARAHYDROXYBENZOATE

Propylis parahydroxybenzoas natricum

 $C_{10}H_{11}NaO_3$ M_r 202.2

DEFINITION

Sodium propyl parahydroxybenzoate contains not less than 99.0 per cent and not more than the equivalent of 104.0 per cent of sodium 4-(propoxycarbonyl)phenolate, calculated with reference to the anhydrous substance.

CHARACTERS

A white, crystalline powder, freely soluble in water, sparingly soluble in alcohol, practically insoluble in methylene chloride.

IDENTIFICATION

First identification: A, B, E.

Second identification: A, C, D, E.

- Dissolve 0.5 g in 50 ml of *water R*. Immediately add 5 ml of *hydrochloric acid R1*. Filter, and wash the precipitate with *water R*. Dry at 80 °C *in vacuo* for 2 h. The melting point (2.2.14) of the precipitate is 96 °C to 99 °C.
- Examine the precipitate obtained in identification test A by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *propyl parahydroxybenzoate CRS*.
- Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (c).
- To about 10 mg in a test-tube add 1 ml of *sodium carbonate solution R*, boil for 30 s and cool. Add 5 ml of *aminopyrazolone solution R* and 1 ml of *potassium ferricyanide solution R* and mix. An orange to red colour develops.
- To 1 ml of solution S (see Tests) add 1 ml of *water R*. The solution gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* prepared from *distilled water R*, and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S, examined immediately after preparation, is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, Method II).

pH (2.2.3). Dilute 1 ml of solution S to 100 ml with *carbon dioxide-free water R*. The pH of the solution is 9.5 to 10.5.

Related substances. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable octadecylsilyl silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution (a). Dissolve 0.100 g of the substance to be examined in 10 ml of *water R*. Immediately add 2 ml of *hydrochloric acid R* and shake with 50 ml of *ether R*.

Evaporate the upper layer to dryness and take up the residue with 10 ml of *acetone R*.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *acetone R*.

Reference solution (a). Dissolve 34.3 mg of *4-hydroxybenzoic acid R* in *acetone R* and dilute to 100 ml with the same solvent.

Reference solution (b). Dilute 0.5 ml of test solution (a) to 100 ml with *acetone R*.

Reference solution (c). Dissolve 10 mg of *propyl parahydroxybenzoate CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (d). Dissolve 10 mg of *ethyl parahydroxybenzoate CRS* in 1 ml of test solution (a) and dilute to 10 ml with *acetone R*.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 1 volume of *glacial acetic acid R*, 30 volumes of *water R* and 70 volumes of *methanol R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. In the chromatogram obtained with test solution (a): any spot due to 4-hydroxybenzoic acid is not more intense than the spot in the chromatogram obtained with reference solution (a) (4 per cent); and any spot, apart from the principal spot and the spot due to 4-hydroxybenzoic acid, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (d) shows two clearly separated principal spots.

Chlorides (2.4.4). To 10 ml of solution S add 30 ml of *water R* and 1 ml of *nitric acid R* and dilute to 50 ml with *water R*. Shake and filter. Dilute 10 ml of the filtrate to 15 ml with *water R*. The solution complies with the limit test for chlorides (350 ppm). Prepare the standard using 14 ml of *chloride standard solution (5 ppm Cl) R* to which 1 ml of *water R* has been added.

Sulphates (2.4.13). To 25 ml of solution S add 5 ml of *distilled water R* and 10 ml of *hydrochloric acid R* and dilute to 50 ml with *distilled water R*. Shake and filter. Dilute 10 ml of the filtrate to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (300 ppm).

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (2.5.12). Not more than 5.0 per cent, determined on 0.500 g by the semi-micro determination of water.

ASSAY

Dissolve 0.150 g in 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 20.22 mg of $C_{10}H_{11}NaO_3$.

IMPURITIES

- R = H: 4-hydroxybenzoic acid,
- R = CH₃: methyl 4-hydroxybenzoate,
- R = CH₂-CH₃: ethyl 4-hydroxybenzoate,
- R = CH₂-CH₂-CH₂-CH₃: butyl 4-hydroxybenzoate.

01/2005:0413

SODIUM SALICYLATE

Natrii salicylas

 $C_7H_5NaO_3$ M_r 160.1**DEFINITION**

Sodium salicylate contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of sodium 2-hydroxybenzenecarboxylate, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder or small, colourless crystals or shiny flakes, freely soluble in water, sparingly soluble in alcohol.

IDENTIFICATION

First identification: A, C.

Second identification: B, C.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *sodium salicylate CRS*.
- B. Solution S (see Tests) gives the reactions of salicylates (2.3.1).
- C. It gives reaction (b) of sodium (2.3.1).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, *Method II*).

Acidity. To 20 ml of solution S add 0.1 ml of *phenol red solution R*. The solution is yellow. Not more than 2.0 ml of 0.01 M *sodium hydroxide* is required to change the colour of the indicator to reddish-violet.

Chlorides (2.4.4). To 5 ml of solution S add 5 ml of *water R* and 10 ml of *dilute nitric acid R* and filter. 10 ml of the filtrate diluted to 15 ml with *water R* complies with the limit test for chlorides (200 ppm).

Sulphates (2.4.13). 2.5 ml of solution S diluted to 15 ml with *distilled water R* complies with the limit test for sulphates (600 ppm).

Heavy metals (2.4.8). Dissolve 1.6 g in 16 ml of a mixture of 5 volumes of *water R* and 10 volumes of *alcohol R*. 12 ml of the solution complies with limit test B for heavy metals (20 ppm). Prepare the standard using lead standard solution (2 ppm Pb) prepared by diluting *lead standard solution (100 ppm Pb) R* with a mixture of 5 volumes of *water R* and 10 volumes of *alcohol R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.00 g by drying in an oven at 100 °C to 105 °C.

ASSAY

Dissolve 0.130 g in 30 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 16.01 mg of $C_7H_5NaO_3$.

STORAGE

Store in an airtight container, protected from light.

01/2005:1677

SODIUM SELENITE PENTAHYDRATE

Natrii selenis pentahydricus

 $Na_2SeO_3 \cdot 5H_2O$ M_r 263.0**DEFINITION**

Content: 98.5 per cent to 101.5 per cent.

CHARACTERS

Appearance: white, crystalline powder, hygroscopic.

Solubility: freely soluble in water, practically insoluble in alcohol.

IDENTIFICATION

- A. Dissolve 50 mg in 5 ml of a mixture of equal volumes of *dilute hydrochloric acid R* and *water R* and heat to boiling. Add 0.05 g of *ascorbic acid R*; a red precipitate is formed which may become black.
- B. Dissolve 50 mg in a mixture of 1 ml of *dilute hydrochloric acid R* and 5 ml of *water R*. Add 1 ml of *barium chloride solution R1*; the solution remains clear.
- C. It gives reaction (a) of sodium (2.3.1).
- D. It complies with the limits of the assay.

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of solution S, add 0.1 ml of *thymolphthalein solution R*; the solution is blue. Not more than 0.3 ml of 1 M *hydrochloric acid* is required to change the colour of the indicator from blue to colourless.

Chlorides (2.4.4): maximum 50 ppm.

To 10 ml of solution S, add 2 ml of *nitric acid R* and dilute to 15 ml with *water R*.

Sulphates and selenates (2.4.13): maximum 300 ppm (determined as sulphates).

Dissolve 0.5 g in 10 ml of *distilled water R*. Add 0.5 ml of *hydrochloric acid R1* and dilute to 15 ml with *distilled water R*.

Iron: maximum 50 ppm.

To 2 ml of solution S, add 2 ml of a 200 g/l solution of *sulphosalicylic acid R*, 5 ml of *concentrated ammonia R* and dilute to 10 ml with *water R*. The solution is not more intensely coloured than a reference solution prepared in the same manner using 1 ml of *iron standard solution (10 ppm Fe) R*.

ASSAY

Dissolve 0.120 g in 50 ml of *water R*, add 7 ml of *glacial acetic acid R*, 25.0 ml of 0.1 M *sodium thiosulphate* and 0.5 g of *potassium iodide R*. Titrate immediately with 0.05 M *iodine solution* using *starch solution R* as indicator.

1 ml of 0.1 M *sodium thiosulphate* is equivalent to 6.575 mg of $Na_2SeO_3 \cdot 5H_2O$.

STORAGE

In an airtight container.

01/2005:0983

SODIUM STARCH GLYCOLATE (TYPE A)

Carboxymethylamylum natricum A

DEFINITION

Sodium starch glycolate (type A) is the sodium salt of a cross-linked partly *O*-carboxymethylated potato starch. It contains not less than 2.8 per cent and not more than 4.2 per cent of Na (*A*, 22.99), calculated with reference to the substance washed with alcohol (80 per cent *V/V*) and dried.

CHARACTERS

A white or almost white, fine, free-flowing powder, very hygroscopic, practically insoluble in methylene chloride. It gives a translucent suspension in water.

Examined under a microscope it is seen to consist of: granules, irregularly shaped, ovoid or pear-shaped, 30 µm to 100 µm in size, or rounded, 10 µm to 35 µm in size; compound granules consisting of two to four components occur occasionally; the granules have an eccentric hilum and clearly visible concentric striations; between crossed nicol prisms, the granules show a distinct black cross intersecting at the hilum; small crystals are visible at the surface of the granules. The granules show considerable swelling in contact with water.

IDENTIFICATION

- A. It complies with the test for pH (see Tests).
- B. Prepare with shaking and without heating a mixture of 4.0 g and 20 ml of *carbon dioxide-free water R*. The mixture has the appearance of a gel. Add 100 ml of *carbon dioxide-free water R* and shake. A suspension forms that settles after standing.
- C. To 5 ml of the suspension obtained in identification test B add 0.05 ml of *iodine solution R1*. A dark blue colour is produced.
- D. Solution S2 (see Tests) gives reaction (a) of sodium (2.3.1).

TESTS

Solution S1. Centrifuge the suspension obtained in identification test B at 2500 *g* for 10 min. Collect carefully the supernatant liquid.

Solution S2. Place 2.5 g in a silica or platinum crucible and add 2 ml of a 500 g/l solution of *sulphuric acid R*. Heat on a water-bath, then cautiously over a naked flame, raising the temperature progressively, and then incinerate in a muffle furnace at 600 ± 25 °C. Continue heating until all black particles have disappeared. Allow to cool, add a few drops of *dilute sulphuric acid R* and heat and incinerate as above. Allow to cool, add a few drops of *ammonium carbonate solution R*, evaporate to dryness and incinerate cautiously. Allow to cool and dissolve the residue in 50 ml of *water R*.

Appearance of solution S1. Solution S1 is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S1 is 5.5 to 7.5.

Sodium glycolate. Carry out the test protected from light.

Test solution. Place 0.20 g of the substance to be examined in a beaker. Add 5 ml of *acetic acid R* and 5 ml of *water R*. Stir until dissolution is complete (about 10 min). Add 50 ml of *acetone R* and 1 g of *sodium chloride R*. Filter through a fast filter paper impregnated with *acetone R*, rinse the beaker and filter with *acetone R*. Combine the filtrate and washings and dilute to 100.0 ml with *acetone R*. Allow to stand for 24 h without shaking. Use the clear supernatant liquid.

Reference solution. Dissolve 0.310 g of *glycollic acid R*, previously dried *in vacuo* over *diphosphorus pentoxide R*, in *water R* and dilute to 500.0 ml with the same solvent. To 5.0 ml of this solution, add 5 ml of *acetic acid R* and allow to stand for about 30 min. Add 50 ml of *acetone R* and 1 g of *sodium chloride R* and dilute to 100.0 ml with *acetone R*.

Heat 2.0 ml of the test solution on a water-bath for 20 min. Cool to room temperature and add 20.0 ml of *2,7-dihydroxynaphthalene solution R*. Shake and heat in a water-bath for 20 min. Cool under running water, transfer to a volumetric flask and dilute to 25.0 ml with *sulphuric acid R*, maintaining the flask under running water. Within 10 min, measure the absorbance at 540 nm (2.2.25) using *water R* as the compensation liquid. The absorbance of the solution prepared with the test solution is not greater than that of a solution prepared at the same time and in the same manner with 2.0 ml of the reference solution (2.0 per cent).

Sodium chloride. Not more than 7.0 per cent. Shake 1.00 g with 20 ml of *alcohol (80 per cent V/V) R* for 10 min and filter. Repeat the operation four times. Dry the residue to constant mass at 100 °C and set aside for the assay. Combine the filtrates. Evaporate to dryness, take up the residue with *water R* and dilute to 25.0 ml with the same solvent. To 10.0 ml of the solution add 30 ml of *water R* and 5 ml of *dilute nitric acid R*. Titrate with 0.1 *M silver nitrate*, determining the end-point potentiometrically (2.2.20), using a silver indicator electrode.

1 ml of 0.1 *M silver nitrate* is equivalent to 5.844 mg of NaCl.

Iron (2.4.9). 10 ml of solution S2 complies with the limit test for iron (20 ppm).

Heavy metals (2.4.8). 1.0 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 10.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C for 4 h.

Microbial contamination. It complies with the test for *Escherichia coli* and *Salmonella* (2.6.13).

ASSAY

To 0.500 g of the dried and crushed residue obtained in the test for sodium chloride add 80 ml of *anhydrous acetic acid R* and heat under a reflux condenser for 2 h. Cool the solution to room temperature. Titrate with 0.1 *M perchloric acid*, determining the end-point potentiometrically (2.2.20). Carry out a blank test.

1 ml of 0.1 *M perchloric acid* is equivalent to 2.299 mg of Na.

STORAGE

Store in an airtight container, protected from light.

01/2005:0984

SODIUM STARCH GLYCOLATE (TYPE B)

Carboxymethylamylum natricum B

DEFINITION

Sodium starch glycolate (type B) is the sodium salt of a cross-linked partly *O*-carboxymethylated potato starch. It contains not less than 2.0 per cent and not more than 3.4 per cent of Na (*A*, 22.99), calculated with reference to the substance washed with alcohol (80 per cent *V/V*) and dried.

CHARACTERS

A white or almost white, fine, free-flowing powder, very hygroscopic, practically insoluble in methylene chloride. It gives a translucent suspension in water.

Examined under a microscope it is seen to consist of: granules, irregularly shaped, ovoid or pear shaped, 30 µm to 100 µm in size, or rounded, 10 µm to 35 µm in size; compound granules consisting of two to four components occur occasionally; the granules have an eccentric hilum and clearly visible concentric striations; between crossed nicol prisms, the granules show a distinct black cross intersecting at the hilum; small crystals are visible at the surface of the granules. The granules show considerable swelling in contact with water.

IDENTIFICATION

- A. It complies with the test for pH (see Tests).
- B. Prepare with shaking and without heating a mixture of 4.0 g and 20 ml of *carbon dioxide-free water R*. The mixture has the appearance of a gel. Add 100 ml of *carbon dioxide-free water R* and shake. A suspension forms that settles after standing.
- C. To 5 ml of the suspension obtained in identification test B add 0.05 ml of *iodine solution R1*. A dark blue colour is produced.
- D. Solution S2 (see Tests) gives reaction (a) of sodium (2.3.1).

TESTS

Solution S1. Centrifuge the suspension obtained in identification test B at 2500 *g* for 10 min. Collect carefully the supernatant liquid.

Solution S2. Place 2.5 g in a silica or platinum crucible and add 2 ml of a 500 g/l solution of *sulphuric acid R*. Heat on a water-bath, then cautiously over a naked flame, raising the temperature progressively, and then incinerate in a muffle furnace at 600 ± 25 °C. Continue heating until all black particles have disappeared. Allow to cool, add a few drops of *dilute sulphuric acid R* and heat and incinerate as above. Allow to cool, add a few drops of *ammonium carbonate solution R*, evaporate to dryness and incinerate cautiously. Allow to cool and dissolve the residue in 50 ml of *water R*.

Appearance of solution S1. Solution S1 is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S1 is 3.0 to 5.0.

Sodium glycolate. Carry out the test protected from light.

Test solution. Place 0.20 g of the substance to be examined in a beaker. Add 5 ml of *acetic acid R* and 5 ml of *water R*. Stir until dissolution is complete (about 10 min). Add 50 ml of *acetone R* and 1 g of *sodium chloride R*. Filter through a fast filter paper impregnated with *acetone R*, rinse the beaker and filter with *acetone R*. Combine the filtrate and washings

and dilute to 100.0 ml with *acetone R*. Allow to stand for 24 h without shaking. Use the clear supernatant liquid.

Reference solution. Dissolve 0.310 g of *glycollic acid R*, previously dried *in vacuo* over *diphosphorus pentoxide R*, in *water R* and dilute to 500.0 ml with the same solvent. To 5.0 ml of this solution, add 5 ml of *acetic acid R* and allow to stand for about 30 min. Add 50 ml of *acetone R* and 1 g of *sodium chloride R* and dilute to 100.0 ml with *acetone R*.

Heat 2.0 ml of the test solution on a water-bath for 20 min. Cool to room temperature and add 20.0 ml of *2,7-dihydroxynaphthalene solution R*. Shake and heat in a water-bath for 20 min. Cool under running water, transfer quantitatively to a volumetric flask and dilute to 25.0 ml with *sulphuric acid R*, maintaining the flasks under running water. Within 10 min, measure the absorbance at 540 nm (2.2.25) using *water R* as the compensation liquid. The absorbance of the solution prepared with the test solution is not greater than that of a solution prepared at the same time and in the same manner with 2.0 ml of the reference solution (2.0 per cent).

Sodium chloride. Not more than 7.0 per cent. Shake 1.00 g with 20 ml of *alcohol (80 per cent V/V) R* for 10 min and filter. Repeat the operation four times. Dry the residue to constant mass at 100 °C and set aside for the assay. Combine the filtrates. Evaporate to dryness, take up the residue with *water R* and dilute to 25.0 ml with the same solvent. To 10.0 ml of the solution add 30 ml of *water R* and 5 ml of *dilute nitric acid R*. Titrate with 0.1 *M silver nitrate*, determining the end-point potentiometrically (2.2.20) using a silver indicator electrode.

1 ml of 0.1 *M silver nitrate* is equivalent to 5.844 mg of NaCl.

Iron (2.4.9). 10 ml of solution S2 complies with the limit test for iron (20 ppm).

Heavy metals (2.4.8). 1.0 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 10.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C for 4 h.

Microbial contamination. It complies with the test for *Escherichia coli* and *Salmonella* (2.6.13).

ASSAY

To 0.500 g of the dried and crushed residue obtained in the test for sodium chloride add 80 ml of *anhydrous acetic acid R* and heat under a reflux condenser for 2 h. Cool the solution to room temperature. Titrate with 0.1 *M perchloric acid*, determining the end-point potentiometrically (2.2.20). Carry out a blank test.

1 ml of 0.1 *M perchloric acid* is equivalent to 2.299 mg of Na.

STORAGE

Store in an airtight container, protected from light.

01/2005:1566

SODIUM STARCH GLYCOLATE (TYPE C)

Carboxymethylamylum natricum C

DEFINITION

Sodium starch glycolate (type C) is the sodium salt of a cross-linked by physical dehydration, partly *O*-carboxymethylated starch. It contains not less than

2.8 per cent and not more than 5.0 per cent of Na (A_r 22.99), calculated with reference to the substance washed with alcohol (80 per cent V/V) and dried.

CHARACTERS

A white or almost white, fine, free-flowing powder, very hygroscopic, soluble in water, practically insoluble in methylene chloride. It gives a translucent gel-like product in water.

Examined under a microscope it is seen to consist of granules, irregularly shaped, ovoid or pear-shaped, 30 µm to 100 µm in size, or rounded, 10 µm to 35 µm in size; compound granules consisting of two to four components occur occasionally; the granules have an eccentric hilum and clearly visible concentric striations; between crossed nicol prisms, the granules show a distinct black cross intersecting at the hilum; small crystals are visible at the surface of the granules. The granules show considerable swelling in contact with water.

IDENTIFICATION

- A. It complies with the test for pH (see Tests).
- B. Mix with shaking and without heating 4.0 g and 20 ml of *carbon dioxide-free water R*. The mixture has the appearance of a gel. Add 100 ml of *carbon dioxide-free water R* and shake: the gel remains stable (difference from types A and B). Keep the gel for the tests for appearance of gel and pH.
- C. To 5 ml of the gel obtained in identification test B add 0.05 ml of *iodine solution RI*. A dark blue colour is produced.
- D. Solution S (see Tests) gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Place 2.5 g in a silica or platinum crucible and add 2 ml of a 500 g/l solution of *sulphuric acid R*. Heat on a water-bath, then cautiously over a naked flame, raising the temperature progressively, and then incinerate in a muffle furnace at 600 ± 25 °C. Continue heating until all black particles have disappeared. Allow to cool, add a few drops of *sulphuric acid R* and heat and incinerate as described above. Allow to cool, add a few drops of *ammonium carbonate solution R*, evaporate to dryness and incinerate cautiously. Allow to cool and dissolve the residue in 50 ml of *water R*.

Appearance of gel. The gel prepared under identification test B is colourless (2.2.2, *Method II*).

pH (2.2.3). The pH of the gel prepared under identification test B is 5.5 to 7.5.

Sodium glycolate. Carry out the test protected from light.

Test solution. Place 0.20 g of the substance to be examined in a beaker. Add 5 ml of *acetic acid R* and 5 ml of *water R*. Stir until dissolution is complete (about 10 min). Add 50 ml of *acetone R* and 1 g of *sodium chloride R*. Filter through a fast filter paper impregnated with *acetone R*, rinse the beaker and filter with *acetone R*. Combine the filtrate and washings and dilute to 100.0 ml with *acetone R*. Allow to stand for 24 h without shaking. Use the clear supernatant liquid.

Reference solution. Dissolve 0.310 g of *glycollic acid R*, previously dried *in vacuo* over *diphosphorus pentoxide R*, in *water R* and dilute to 500.0 ml with the same solvent. To 5.0 ml of this solution, add 5 ml of *acetic acid R* and allow to stand for about 30 min. Add 50 ml of *acetone R* and 1 g of *sodium chloride R* and dilute to 100.0 ml with *acetone R*.

Heat 2.0 ml of the test solution on a water-bath for 20 min. Cool to room temperature and add 20.0 ml of *2,7-dihydroxynaphthalene solution R*. Shake and heat on a water-bath for 20 min. Cool under running water, transfer

to a volumetric flask and dilute to 25.0 ml with *sulphuric acid R*, maintaining the flask under running water. Within 10 min, measure the absorbance at 540 nm (2.2.25) using *water R* as the compensation liquid. The absorbance of the solution prepared with the test solution is not greater than that of a solution prepared at the same time and in the same manner with 2.0 ml of the reference solution (2.0 per cent).

Sodium chloride. Not more than 1 per cent. Shake 1.00 g with 20 ml of *alcohol (80 per cent V/V) R* for 10 min and filter. Repeat the operation four times. Dry the residue to constant mass at 100 °C and set aside for the assay. Combine the filtrates. Evaporate to dryness, take up the residue with *water R* and dilute to 25.0 ml with the same solvent. To 10.0 ml of the solution add 30 ml of *water R* and 5 ml of *dilute nitric acid R*. Titrate with 0.1 M *silver nitrate*, determining the end-point potentiometrically (2.2.20), using a silver indicator electrode.

1 ml of 0.1 M *silver nitrate* is equivalent to 5.844 mg of NaCl.

Iron (2.4.9). 10 ml of solution S complies with the limit test for iron (20 ppm).

Heavy metals (2.4.8). 1.0 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 7.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C for 4 h.

Microbial contamination. It complies with the test for *Escherichia coli* and *Salmonella* (2.6.13).

ASSAY

To 0.500 g of the dried and crushed residue obtained in the test for sodium chloride add 80 ml of *anhydrous acetic acid R* and heat under a reflux condenser for 2 h. Cool the solution to room temperature. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20). Carry out a blank test.

1 ml of 0.1 M *perchloric acid* is equivalent to 2.299 mg of Na.

STORAGE

Store in an airtight container, protected from light.

01/2005:2058

SODIUM STEARATE

Natrii stearas

DEFINITION

Mixture of sodium salts of different fatty acids consisting mainly of stearic acid [$C_{17}H_{35}COONa$; M_r 306.5] and palmitic acid [$C_{15}H_{31}COONa$; M_r 278.4].

Content:

- sodium: 7.4 per cent to 8.5 per cent (A_r 22.99) (dried substance),
- stearic acid in the fatty acid fraction: minimum 40 per cent,
- sum of stearic acid and palmitic acid in the fatty acid fraction: minimum 90 per cent.

CHARACTERS

Appearance: white or yellowish, fine powder, with a greasy touch.

Solubility: slightly soluble in water and in alcohol.

IDENTIFICATION

First identification: C, D.

Second identification: A, B, D.

- A. Freezing point (2.2.18): minimum 53 °C for the residue obtained in the preparation of solution S (see Tests).
- B. Acid value (2.5.1): 195 to 210, determined on 0.200 g of the residue obtained in the preparation of solution S dissolved in 25 ml of the prescribed mixture of solvents.
- C. Examine the chromatograms obtained in the assay of stearic acid and palmitic acid.

Results: the 2 principal peaks in the chromatogram obtained with the test solution are similar in retention time and size to the 2 principal peaks in the chromatogram obtained with the reference solution.

- D. Solution S gives reaction (b) of sodium (2.3.1).

TESTS

Solution S. To 10.0 g add 100 ml of *peroxide-free ether R* and 80 ml of *acetic acid R*. Boil under a reflux condenser until dissolution is complete. Allow to cool. In a separating funnel, separate the aqueous layer and shake the ether layer with 2 quantities, each of 8 ml, of *acetic acid R*. Combine the aqueous layers, wash with 30 ml of *peroxide-free ether R* and dilute to 100 ml with *distilled water R* (solution S). Evaporate the ether layers to dryness on a water-bath and dry the residue at 100-105 °C.

Acidity or alkalinity. Dissolve 2.0 g in 50 ml of previously neutralised *alcohol R* and add 3 drops of *phenolphthalein solution R*; the solution is colourless. Not less than 0.60 ml and not more than 0.85 ml of 0.1 M sodium hydroxide is required to change the colour of the indicator.

Chlorides (2.4.4): maximum 0.1 per cent.

Dilute 0.5 ml of solution S to 15 ml with *water R*.

Sulphates (2.4.13): maximum 0.3 per cent.

Dilute 0.5 ml of solution S to 15 ml with *distilled water R*.

Nickel: maximum 5 ppm.

Atomic absorption spectrometry (2.2.23, *Method II*).

Test solution. Place 50.0 mg of the substance to be examined in a polytetrafluoroethylene digestion flask and add 0.5 ml of a mixture of 1 volume of *heavy metal-free hydrochloric acid R* and 5 volumes of *heavy metal-free nitric acid R*. Allow to digest at 170 °C for 5 h. Allow to cool. Dissolve the residue in *water R* and dilute to 5.0 ml with the same solvent.

Reference solutions. Prepare the reference solutions using *nickel standard solution (10 ppm Ni) R*, diluted as necessary with *water R*.

Source: nickel hollow-cathode lamp.

Wavelength: 232.0 nm.

Atomisation device: air-acetylene flame.

Loss on drying (2.2.32): maximum 5.0 per cent.

In a weighing glass introduce 1.0 g of previously washed *sand R*, dry at 100-105 °C and weigh. Add 0.500 g of the substance to be examined and 10 ml of *alcohol R*. Evaporate the alcohol at 80 °C and dry the residue at 100-105 °C for 4 h.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10³ micro-organisms per gram, determined by plate count. It complies with the test for *Escherichia coli* (2.6.13).

ASSAY

Sodium. Dissolve 0.250 g with gentle heating in a mixture of 5 ml of *acetic anhydride R* and 20 ml of *anhydrous acetic acid R*. Cool and add 20 ml of *dioxan R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 2.299 mg of Na.

Stearic acid and palmitic acid. Gas chromatography (2.2.28): use the normalisation procedure.

Test solution. In a conical flask fitted with a reflux condenser, dissolve 0.10 g of the substance to be examined in 5 ml of *boron trifluoride-methanol solution R*. Boil under a reflux condenser for 10 min. Add 4 ml of *heptane R* through the condenser and boil again under a reflux condenser for 10 min. Allow to cool. Add 20 ml of *saturated sodium chloride solution R*. Shake and allow the layers to separate. Remove about 2 ml of the organic layer and dry over 0.2 g of *anhydrous sodium sulphate R*. Dilute 1.0 ml of the solution to 100.0 ml with *heptane R*.

Reference solution. Prepare the reference solution in the same manner as the test solution using 50.0 mg of *palmitic acid CRS* and 50.0 mg of *stearic acid CRS* instead of the substance to be examined.

Column:

- **material:** fused silica,
- **size:** *l* = 30 m, Ø = 0.32 mm,
- **stationary phase:** *macrogol 20 000 R* (film thickness 0.5 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 2.4 ml/min.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 2	70
	2 - 36	70 → 240
	36 - 41	240
Injection port		220
Detector		260

Detection: flame ionisation.

Injection: 1 µl.

Relative retention with reference to methyl stearate (retention time = about 40 min): methyl palmitate = about 0.88.

System suitability: reference solution:

- **resolution:** minimum 5.0 between the peaks due to methyl stearate and methyl palmitate.

Calculate the content of stearic acid and palmitic acid.

STORAGE

In an airtight container, protected from light.

01/2005:1567

SODIUM STEARYL FUMARATE

Natrii stearylis fumaras

C₂₂H₃₉NaO₄

*M*_r 390.5

DEFINITION

Sodium octadecyl (*E*)-butenedioate.

Content: 99.0 per cent to 101.5 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, fine powder with agglomerates of flat, circular particles.

Solubility: practically insoluble in water, slightly soluble in methanol, practically insoluble in acetone and in ethanol.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: sodium stearyl fumarate CRS.

TESTS

Related substances. Gas chromatography (2.2.28): use the normalisation procedure.

Silylation solution. To 2 ml of *N,O*-bis(trimethylsilyl)trifluoroacetamide *R* add 0.02 ml of chlorotrimethylsilane *R* and mix.

Test solution. Introduce 15.0 mg of the substance to be examined in a vial with a screw cap and add 1 ml of the silylation solution. Seal the vial and heat at about 70 °C for 1 h. After the reaction a precipitate remains in the vial; filter the solution through a nylon filter (pore size 0.45 µm).

Reference solution. Introduce 1.0 mg of sodium stearyl maleate CRS and 1.0 mg of sodium stearyl fumarate CRS into a vial with a screw cap and add 1 ml of the silylation solution. Seal the vial and heat at about 70 °C for 1 h.

Column:

- *material*: fused silica,
- *size*: *l* = 15 m, Ø = 0.53 mm,
- *stationary phase*: poly(dimethyl)siloxane *R* (film thickness 0.15 µm).

Carrier gas: helium for chromatography *R*.

Flow rate: 2 ml/min.

Split ratio: 1:25.

Temperature:

	Time (min)	Temperature (°C)
	0 - 1	180
Column	1 - 21	180 → 320
	21 - 26	320
Injection port		250
Detector		320

Detection: flame ionisation.

Injection: 2 µl.

Relative retention with reference to stearyl trimethylsilyl fumarate (retention time = about 9 min): stearyl alcohol = 0.30; stearyl trimethylsilyl ether = 0.35; palmityl trimethylsilyl fumarate = 0.80; heptadecyl trimethylsilyl fumarate = 0.85; stearyl trimethylsilyl maleate = 0.90; nonadecyl trimethylsilyl fumarate = 1.05; eicos-11-enyl trimethylsilyl fumarate = 1.15; distearyl fumarate = 2.25.

System suitability:

- *resolution*: minimum 1.5 between the peaks in the chromatogram obtained with the reference solution.

Limits:

- *any impurity*: maximum 0.5 per cent,
- *total*: maximum 5.0 per cent.

Water (2.5.12): maximum 5.0 per cent, determined on 0.250 g.

ASSAY

Dissolve 0.250 g, accurately weighed, in 10 ml of methylene chloride *R* and add 30 ml of anhydrous acetic acid *R*. Titrate with 0.1 *M* perchloric acid, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 *M* perchloric acid is equivalent to 39.05 mg of C₂₂H₃₉NaO₄.

01/2005:0099

SODIUM SULPHATE, ANHYDROUS

Natrii sulfas anhydricus

Na₂SO₄*M_r* 142.0

DEFINITION

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white powder, hygroscopic.

Solubility: freely soluble in water.

IDENTIFICATION

- A. It gives the reactions of sulphates (2.3.1).
- B. It gives the reactions of sodium (2.3.1).
- C. It complies with the test for loss on drying (see Tests).

TESTS

Solution S. Dissolve 2.2 g in carbon dioxide-free water *R* prepared from distilled water *R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, Method II).

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of bromothymol blue solution *R1*. Not more than 0.5 ml of 0.01 *M* hydrochloric acid or 0.01 *M* sodium hydroxide is required to change the colour of the indicator.

Chlorides (2.4.4): maximum 450 ppm.

5 ml of solution S diluted to 15 ml with water *R* complies with the limit test for chlorides.

Calcium (2.4.3): maximum 450 ppm, if intended for use in the manufacture of parenteral dosage forms.

10 ml of solution S diluted to 15 ml with distilled water *R* complies with the limit test for calcium.

Iron (2.4.9): maximum 90 ppm, if intended for use in the manufacture of parenteral dosage forms.

5 ml of solution S diluted to 10 ml with water *R* complies with the limit test for iron.

Magnesium: maximum 200 ppm, if intended for use in the manufacture of parenteral dosage forms.

To 10 ml of solution S add 1 ml of glycerol (85 per cent) *R*, 0.15 ml of titan yellow solution *R*, 0.25 ml of ammonium oxalate solution *R* and 5 ml of dilute sodium hydroxide solution *R* and shake. Any pink colour in the test solution is not more intense than that in a standard prepared at the same time in the same manner using a mixture of 5 ml of magnesium standard solution (10 ppm Mg) *R* and 5 ml of water *R*.

Heavy metals (2.4.8): maximum 45 ppm.

12 ml of solution S complies with limit test A. Prepare the standard using lead standard solution (1 ppm Pb) *R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 130 °C.

ASSAY

Dissolve 0.100 g in 40 ml of *water R*. Add a mixture of 0.2 ml of 0.1 M hydrochloric acid and 80 ml of *methanol R*. Carry out a potentiometric titration (2.2.20), using 0.1 M lead nitrate and as indicator electrode a lead-selective electrode and as reference electrode a silver-silver chloride electrode.

1 ml of 0.1 M lead nitrate is equivalent to 14.20 mg of Na₂SO₄.

STORAGE

Store in an airtight container.

LABELLING

The label states, where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms.

01/2005:0100

SODIUM SULPHATE DECAHYDRATE

Natrii sulfas decahydricus

Na₂SO₄·10H₂O

*M*_r 322.2

DEFINITION

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white, crystalline powder or colourless, transparent crystals.

Solubility: freely soluble in water, practically insoluble in alcohol. It partly dissolves in its own water of crystallisation at about 33 °C.

IDENTIFICATION

- It gives the reactions of sulphates (2.3.1).
- It gives the reactions of sodium (2.3.1).
- It complies with the test for loss on drying (see Tests).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.5 ml of 0.01 M hydrochloric acid or 0.01 M sodium hydroxide is required to change the colour of the indicator.

Chlorides (2.4.4): maximum 200 ppm.

5 ml of solution S diluted to 15 ml with *water R* complies with the limit test for chlorides.

Calcium (2.4.3): maximum 200 ppm, if intended for use in the manufacture of parenteral dosage forms.

10 ml of solution S diluted to 15 ml with *distilled water R* complies with the limit test for calcium.

Iron (2.4.9): maximum 40 ppm, if intended for use in the manufacture of parenteral dosage forms.

5 ml of solution S diluted to 10 ml with *water R* complies with the limit test for iron.

Magnesium: maximum 100 ppm, if intended for use in the manufacture of parenteral dosage forms.

To 10 ml of solution S add 1 ml of *glycerol (85 per cent) R*, 0.15 ml of *titan yellow solution R*, 0.25 ml of *ammonium oxalate solution R* and 5 ml of *dilute sodium hydroxide solution R* and shake. Any pink colour in the test solution is not more intense than that in a standard prepared at the same time in the same manner using a mixture of 5 ml of *magnesium standard solution (10 ppm Mg) R* and 5 ml of *water R*.

Heavy metals (2.4.8): maximum 20 ppm.

12 ml of solution S complies with limit test A. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32): 52.0 per cent to 57.0 per cent, determined on 1.000 g by drying at 30 °C for 1 h, then at 130 °C.

ASSAY

Dissolve 0.250 g in 40 ml of *water R*. Add a mixture of 0.2 ml of 0.1 M hydrochloric acid and 80 ml of *methanol R*. Carry out a potentiometric titration (2.2.20), using 0.1 M lead nitrate and as indicator electrode a lead-selective electrode and as reference electrode a silver-silver chloride electrode.

1 ml of 0.1 M lead nitrate is equivalent to 14.20 mg of Na₂SO₄.

LABELLING

The label states, where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms.

01/2005:0775

SODIUM SULPHITE, ANHYDROUS

Natrii sulfis anhydricus

Na₂SO₃

*M*_r 126.0

DEFINITION

Anhydrous sodium sulphite contains not less than 95.0 per cent and not more than the equivalent of 100.5 per cent of Na₂SO₃.

CHARACTERS

A white powder, freely soluble in water, very slightly soluble in alcohol.

IDENTIFICATION

- Solution S (see Tests) is slightly alkaline (2.2.4).
- To 5 ml of solution S, add 0.5 ml of 0.05 M iodine. The solution is colourless and gives reaction (a) of sulphates (2.3.1).
- Solution S gives reaction (a) of sodium (2.3.1).
- It complies with the limits of the assay.

TESTS

Solution S. Dissolve 5 g in *water R* and dilute to 100 ml with the same solvent.

Solution S1. To 10.0 g add 25 ml of *water R*. Shake until mostly dissolved and carefully and progressively add 15 ml of *hydrochloric acid R*. Heat to boiling. Cool and dilute to 100.0 ml with *water R*.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method I*).

Thiosulphates. To 2.00 g add 100 ml of *water R*. Shake and add 10 ml of *formaldehyde solution R* and 10 ml of *acetic acid R*. Allow to stand for 5 min. Add 0.5 ml of *starch solution R* and titrate with 0.05 M *iodine*. Carry out a blank titration. The difference between the volumes used in the titrations is not more than 0.15 ml (0.1 per cent).

Iron (2.4.9). 10 ml of solution S1 complies with the limit test for iron (10 ppm).

Selenium. To 3.0 g add 10 ml of *formaldehyde solution R* and carefully and progressively add 2 ml of *hydrochloric acid R*. Heat on a water-bath for 20 min. Any pink colour in the solution is not more intense than that of a standard prepared at the same time and in the same manner using 1.0 g of the substance to be examined to which has been added 0.2 ml of *selenium standard solution (100 ppm Se) R* (10 ppm).

Zinc. Not more than 25 ppm of Zn, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dilute 2.0 ml of solution S1 to 10.0 ml with *water R*.

Reference solutions. Prepare the reference solutions using *zinc standard solution (100 ppm Zn) R*, diluted as necessary with *water R*.

Measure the absorbance at 213.9 nm using a zinc hollow-cathode lamp as source of radiation and an air-acetylene flame.

Heavy metals (2.4.8). 12 ml of solution S1 complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

ASSAY

Introduce 0.250 g into a 500 ml conical flask containing 50.0 ml of 0.05 M *iodine*. Shake until completely dissolved. Add 1 ml of *starch solution R* and titrate the excess of iodine with 0.1 M *sodium thiosulphate*. Carry out a blank titration. 1 ml of 0.05 M *iodine* is equivalent to 6.30 mg of Na₂SO₃.

STORAGE

Store in an airtight container.

01/2005:0776

SODIUM SULPHITE HEPTAHYDRATE

Natrii sulfis heptahydricus

Na₂SO₃·7H₂O

*M*_r 252.2

DEFINITION

Sodium sulphite heptahydrate contains not less than 48.0 per cent and not more than the equivalent of 52.5 per cent of Na₂SO₃.

CHARACTERS

Colourless crystals, freely soluble in water, very slightly soluble in alcohol.

IDENTIFICATION

- Solution S (see Tests) is slightly alkaline (2.2.4).
- To 5 ml of solution S, add 0.5 ml of 0.05 M *iodine*. The solution is colourless and gives reaction (a) of sulphates (2.3.1).
- Solution S gives reaction (a) of sodium (2.3.1).
- It complies with the limits of the assay.

TESTS

Solution S. Dissolve 10 g in *water R* and dilute to 100 ml with the same solvent.

Solution S1. To 20.0 g add 25 ml of *water R*. Shake until mostly dissolved and carefully and progressively add 15 ml of *hydrochloric acid R*. Heat to boiling. Cool and dilute to 100.0 ml with *water R*.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method I*).

Thiosulphates. To 4.00 g add 100 ml of *water R*. Shake to dissolve and add 10 ml of *formaldehyde solution R* and 10 ml of *acetic acid R*. Allow to stand for 5 min. Add 0.5 ml of *starch solution R* and titrate with 0.05 M *iodine*. Carry out a blank titration. The difference between the volumes used in the titrations is not more than 0.15 ml (0.05 per cent).

Iron (2.4.9). 10 ml of solution S1 complies with the limit test for iron (5 ppm).

Selenium. To 6.0 g add 10 ml of *formaldehyde solution R* and carefully and progressively add 2 ml of *hydrochloric acid R*. Heat on a water-bath for 20 min. Any pink colour in the solution is not more intense than that of a standard prepared at the same time and in the same manner using 2.0 g of the substance to be examined to which has been added 0.2 ml of *selenium standard solution (100 ppm Se) R* (5 ppm).

Zinc. Not more than 12 ppm of Zn, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dilute 2.0 ml of solution S1 to 10.0 ml with *water R*.

Reference solutions. Prepare the reference solutions using *zinc standard solution (100 ppm Zn) R*, diluted as necessary with *water R*.

Measure the absorbance at 213.9 nm using a zinc hollow-cathode lamp as source of radiation and an air-acetylene flame.

Heavy metals (2.4.8). 12 ml of solution S1 complies with limit test A for heavy metals (5 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

ASSAY

Introduce 0.500 g into a 500 ml conical flask containing 50.0 ml of 0.05 M *iodine*. Shake until completely dissolved. Add 1 ml of *starch solution R* and titrate the excess of iodine with 0.1 M *sodium thiosulphate*. Carry out a blank titration. 1 ml of 0.05 M *iodine* is equivalent to 6.30 mg of Na₂SO₃.

01/2005:0414

SODIUM THIOSULPHATE

Natrii thiosulfas

Na₂S₂O₃·5H₂O

*M*_r 248.2

DEFINITION

Sodium thiosulphate contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of Na₂S₂O₃·5H₂O.

CHARACTERS

Transparent, colourless crystals, efflorescent in dry air, very soluble in water, practically insoluble in alcohol. It dissolves in its water of crystallisation at about 49 °C.

IDENTIFICATION

- It decolourises *iodinated potassium iodide solution R*.

- B. To 0.5 ml of solution S (see Tests) add 0.5 ml of *water R* and 2 ml of *silver nitrate solution R2*. A white precipitate is formed which rapidly becomes yellowish and then black.
- C. To 2.5 ml of solution S add 2.5 ml of *water R* and 1 ml of *hydrochloric acid R*. A precipitate of sulphur is formed and gas is evolved which gives a blue colour to *starch iodate paper R*.
- D. 1 ml of solution S gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 6.0 to 8.4.

Sulphates and sulphites. Dilute 2.5 ml of solution S to 10 ml with *distilled water R*. To 3 ml of this solution first add 2 ml of *iodinated potassium iodide solution R* and continue the addition dropwise until a very faint persistent yellow colour appears. Dilute to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (2.4.13) (0.2 per cent).

Sulphides. To 10 ml of solution S add 0.05 ml of a freshly prepared 50 g/l solution of *sodium nitroprusside R*. The solution does not become violet.

Heavy metals. To 10 ml of solution S add 0.05 ml of *sodium sulphide solution R*. After 2 min, any brown colour in the solution is not more intense than that in a standard prepared at the same time and in the same manner using 10 ml of *lead standard solution (1 ppm Pb) R* (10 ppm).

ASSAY

Dissolve 0.500 g in 20 ml of *water R* and titrate with 0.05 M *iodine*, using 1 ml of *starch solution R*, added towards the end of the titration, as indicator.

1 ml of 0.05 M *iodine* is equivalent to 24.82 mg of $\text{Na}_2\text{S}_2\text{O}_3 \cdot 5\text{H}_2\text{O}$.

STORAGE

Store in an airtight container.

IDENTIFICATION

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *sodium valproate CRS*. If the spectra obtained in the solid state for the substance to be examined and the reference substance show differences, record further spectra using discs prepared by placing 50 µl of a 100 g/l solution in *methanol R* on a disc of *potassium bromide R* and evaporating the solvent *in vacuo*. Use the discs immediately.
- B. Examine the chromatograms obtained in the test for related substances. The retention time of the principal peak in the chromatogram obtained with test solution (b) corresponds to that of the principal peak in the chromatogram obtained with reference solution (b).
- C. 2 ml of solution S (see Tests) gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 1.25 g in 20 ml of *distilled water R* in a separating funnel, add 5 ml of *dilute nitric acid R* and shake. Allow the mixture to stand for 12 h. Use the lower layer.

Appearance of solution. Dissolve 2.0 g in *water R* and dilute to 10 ml with the same solvent. The solution is not more opalescent than reference suspension II (2.2.1) and not more intensely coloured than reference solution Y_6 (2.2.2, *Method II*).

Acidity or alkalinity. Dissolve 1.0 g in 10 ml of *water R*. Add 0.1 ml of *phenolphthalein solution R*. Not more than 0.75 ml of 0.1 M *hydrochloric acid* or 0.1 M *sodium hydroxide* is required to change the colour of the indicator.

Related substances. Examine by gas chromatography (2.2.28), using *butyric acid R* as the internal standard.

Internal standard solution. Dissolve 10 mg of *butyric acid R* in *heptane R* and dilute to 200 ml with the same solvent.

Test solution (a). Dissolve 0.500 g of the substance to be examined in 10 ml of *water R*. Add 5 ml of *dilute sulphuric acid R* and shake with three quantities, each of 20 ml, of *heptane R*. Add 10.0 ml of the internal standard solution to the combined upper layers, shake with *anhydrous sodium sulphate R*, filter and evaporate the filtrate, at a temperature not exceeding 30 °C, using a rotary evaporator. Take up the residue with *heptane R* and dilute to 10.0 ml with the same solvent. Dilute 1.0 ml of the solution to 10.0 ml with *heptane R*.

Test solution (b). Dissolve 40 mg of the substance to be examined in 100 ml of *water R*. To 10 ml of the solution add 0.5 ml of *dilute sulphuric acid R* and shake with three quantities, each of 5 ml, of *heptane R*. Shake with *anhydrous sodium sulphate R*, filter and evaporate the filtrate, at a temperature not exceeding 30 °C, to a volume of about 10 ml, using a rotary evaporator.

Reference solution (a). Dissolve 20 mg of 2-(1-methylethyl)pentanoic acid CRS in 5.0 ml of test solution (b) and dilute to 10 ml with *heptane R*. Dilute 1 ml of the solution to 10 ml with *heptane R*.

Reference solution (b). Prepare as prescribed for test solution (b), using *sodium valproate CRS* instead of the substance to be examined.

The chromatographic procedure may be carried out using:

- a wide-bore fused-silica column 30 m long and 0.53 mm in internal diameter coated with *macrogol 20 000 2-nitroterephthalate R* (film thickness 0.5 µm),
- *helium for chromatography R* as the carrier gas at a flow rate of 8 ml/min,
- a flame-ionisation detector,

01/2005:0678

SODIUM VALPROATE

Natrii valproas

 $\text{C}_8\text{H}_{15}\text{NaO}_2$ M_r 166.2

DEFINITION

Sodium valproate contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of sodium 2-propylpentanoate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, hygroscopic, very soluble in water, slightly to freely soluble in alcohol.

with the following temperature programme:

	Time (min)	Temperature (°C)	Rate (°C/min)	Comment
Column	0 - 10	130	-	isothermal
	10 - 30	130 → 190	3	linear gradient
Injection port		220		
Detector		220		

Inject 1 µl of each solution. Adjust the sensitivity of the system so that the height of the peak due to the internal standard is at least 20 per cent of the full scale of the recorder. The test is not valid unless, in the chromatogram obtained with reference solution (a), the resolution between the peaks corresponding to 2-(1-methylethyl)pentanoic acid and valproic acid is at least 3.0. In the chromatogram obtained with test solution (a): the sum of the areas of the peaks, apart from the principal peak is not greater than three times the area of the peak due to the internal standard (0.3 per cent); none of the peaks, apart from the principal peak, has an area greater than that of the peak due to the internal standard (0.1 per cent). Disregard any peak with an area less than 0.1 times the area of the peak due to the internal standard.

Chlorides (2.4.4). To 5 ml of solution S add 10 ml of *water R*. The solution complies with the limit test for chlorides (200 ppm).

Sulphates (2.4.13). Solution S complies with the limit test for sulphates (200 ppm).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 2.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

ASSAY

Dissolve 0.1500 g in 25 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid* determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid*, is equivalent to 16.62 mg of C₈H₁₅NaO₂.

STORAGE

Store in an airtight container.

IMPURITIES

- A. R = R' = H: pentanoic acid (valeric acid),
 B. R = H, R' = CH₂-CH₃: (2*RS*)-2-ethylpentanoic acid,
 C. R = H, R' = CH(CH₃)₂: (2*RS*)-2-(1-methylethyl)pentanoic acid,
 D. R = R' = CH₂-CH₂-CH₃: 2,2-dipropylpentanoic acid,

- E. R = R' = H: pentanamide (valeramide),
 F. R = H, R' = CH₂-CH₂-CH₃: 2-propylpentanamide,
 G. R = R' = CH₂-CH₂-CH₃: 2,2-dipropylpentanamide,

- H. R = R' = H: pentanenitrile (valeronitrile),
 I. R = H, R' = CH₂-CH₂-CH₃: 2-propylpentanenitrile,
 J. R = R' = CH₂-CH₂-CH₃: 2,2-dipropylpentanenitrile.

01/2005:1264

SOLUTIONS FOR ORGAN PRESERVATION

Solutiones ad conservationem partium corporis

DEFINITION

Solutions for organ preservation are sterile, aqueous preparations, intended for storage, protection and/or perfusion of mammalian body organs that are in particular destined for transplantation.

They contain electrolytes that are typically at a concentration close to the intracellular electrolyte composition.

They may contain carbohydrates (such as glucose or mannitol), amino acids, calcium-complexing agents (such as citrate or phosphate), hydrocolloids (such as starch or gelatin derivatives) and other excipients, for example to make the preparation isotonic with blood, to adjust or buffer the pH, to prevent deterioration of the ingredients, but not to adversely affect the intended action of the preparation or, at the concentration used, to cause toxicity or undue local irritation. Solutions for organ preservation may also contain active substances or these may be added immediately before use.

Solutions for organ preservation, examined under suitable conditions of visibility, are clear and practically free from particles.

Solutions for organ preservation may also be presented as concentrated solutions. They are diluted to the prescribed volume with a prescribed liquid immediately before use. After dilution, they comply with the requirements for solutions for organ preservation.

Before use, the solutions for organ preservation are cooled below room temperature, typically to 2 °C to 6 °C, to reduce the temperature of the body organ and its metabolism.

Where applicable, the containers for solutions for organ preservation comply with the requirements for *Materials used for the manufacture of containers* (3.1 and subsections) and *Containers* (3.2 and subsections). Solutions for organ preservation are supplied in glass containers (3.2.1) or in other containers such as plastic containers (3.2.2 and 3.2.8). The tightness of the container is ensured by suitable means. Closures ensure a good seal, prevent the access of micro-organisms and other contaminants and usually permit the withdrawal of a part or the whole of the contents without removal of the closure. The plastic materials or elastomers of which the closure is composed are sufficiently firm and elastic to allow the passage of a needle with the least possible shedding of particles.

PRODUCTION

Solutions for organ preservation are prepared using materials and methods designed to ensure their sterility and to avoid the introduction of contaminants and the growth of micro-organisms; recommendations on this aspect are provided in the text on *Methods of preparation of sterile products* (5.1.1).

Unless otherwise justified and authorised, solutions for organ preservation are prepared from *water for injections R* and do not contain antimicrobial preservatives.

TESTS

pH (2.2.3). Carry out the test at room temperature. The pH of the solution is 5.0 to 8.0.

Osmolality (2.2.35). The osmolality of the solution is 250 mosmol/kg to 380 mosmol/kg.

Hydroxymethylfurfural. If the solution contains glucose, it complies with the following test: to a volume of the preparation to be examined containing the equivalent of 25 mg of glucose, add 5.0 ml of a 100 g/l solution of *p*-toluidine *R* in 2-propanol *R* containing 10 per cent *V/V* of glacial acetic acid *R* and 1.0 ml of a 5 g/l solution of barbituric acid *R*. The absorbance (2.2.25), determined at 550 nm after allowing the mixture to stand for 2 min to 3 min, is not greater than that of a standard prepared at the same time in the same manner using a solution containing 10 µg of hydroxymethylfurfural *R* in the same volume as the preparation to be examined.

Particulate contamination. Carry out the test for sub-visible particles (2.9.19) using 50 ml of preparation to be examined. The solution contains not more than 50 particles per millilitre larger than 10 µm and not more than 5 particles per millilitre larger than 25 µm.

Products for which the label states that the product is to be used with a final filter are exempted from these requirements.

Sterility (2.6.1). The solution complies with the test for sterility.

Bacterial endotoxins (2.6.14): less than 0.5 IU/ml.

Pyrogens (2.6.8). Solutions for which a validated test for bacterial endotoxins cannot be carried out comply with the test for pyrogens. Inject per kilogram of the rabbit's mass 10 ml of the solution, unless otherwise justified and authorised.

LABELLING

The label states:

- that the solution is not to be used for injection,
- the formula of the solution for organ preservation expressed in grams per litre and in millimoles per litre,
- the nominal volume of the solution for organ preservation in the container,
- the osmolality, expressed in milliosmoles per kilogram,
- that any unused portion of the ready-to-use solution, of the concentrated solution or of the diluted solution must be discarded,
- the storage conditions,
- if applicable, that the solution is to be used in conjunction with a final filter.

In addition, for concentrated solutions the label states that the solution must be diluted with a suitable liquid immediately before use.

01/2005:0949

SOMATOSTATIN

Somatostatinum

DEFINITION

Somatostatin is a cyclic tetradecapeptide having the structure of the hypothalamic hormone that inhibits the release of human growth hormone. It is obtained by chemical synthesis. It contains a variable amount of acetic acid. It is available in the freeze-dried form.

Content: 95.0 per cent to 103.0 per cent of somatostatin (anhydrous and acetic acid-free substance).

CHARACTERS

Appearance: white, amorphous powder.

Solubility: freely soluble in water and in acetic acid, practically insoluble in methylene chloride.

IDENTIFICATION

A. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 1.0 mg of the substance to be examined in 1.0 ml of *water R*.

Reference solution. Dissolve the contents of a vial of *somatostatin CRS* in *water R* and dilute with the same solvent to obtain a final concentration of 1 mg/ml.

Plate: TLC silica gel plate *R*.

Mobile phase: glacial acetic acid *R*, pyridine *R*, *water R*, butanol *R* (10:15:20:45 *V/V/V/V*).

Application: 20 µl.

Development: over a path of 15 cm.

Drying: in a current of warm air.

Detection: spray with a 1 g/l solution of *ninhydrin R* and heat the plate in an oven at 110 °C for about 5 min.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

B. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with the reference solution.

TESTS

Specific optical rotation (2.2.7): –37 to –47 (anhydrous and acetic acid-free substance).

Dissolve 2.0 mg in 1.0 ml of a 1.0 per cent *V/V* solution of glacial acetic acid *R*.

Absorbance (2.2.25): maximum 0.20 at 280 nm (calculated with reference to the peptide content as determined in the assay).

Dissolve 5.0 mg in a 9 g/l solution of *sodium chloride R* and dilute to 100.0 ml with the same solvent.

Amino acids. Examine by means of an amino-acid analyser. Standardise the apparatus with a mixture containing equimolar amounts of ammonia, glycine and the L-form of the following amino acids:

Lysine	Threonine	Alanine	Leucine
Histidine	Serine	Valine	Tyrosine
Arginine	Glutamic acid	Methionine	Phenylalanine
Aspartic acid	Proline	Isoleucine	

together with half the equimolar amount of L-cystine. For the validation of the method, an appropriate internal standard, such as *DL-norleucine R*, is used.

Test solution. Place 1.0 mg of the substance to be examined in a rigorously cleaned hard-glass tube 100 mm long and 6 mm in internal diameter. Add a suitable amount of a

50 per cent *V/V* solution of *hydrochloric acid R*. Immerse the tube in a freezing mixture at -5°C , reduce the pressure to below 133 Pa and seal. Heat at $110\text{--}115^{\circ}\text{C}$ for 16 h. Cool, open the tube, transfer the contents to a 10 ml flask with the aid of 5 quantities, each of 0.2 ml, of *water R* and evaporate to dryness over *potassium hydroxide R* under reduced pressure. Take up the residue in *water R* and evaporate to dryness over *potassium hydroxide R* under reduced pressure; repeat these operations once. Take up the residue in a buffer solution suitable for the amino-acid analyser used and dilute to a suitable volume with the same buffer solution. Apply a suitable volume to the amino-acid analyser.

Express the content of each amino acid in moles. Calculate the relative proportions of the amino acids taking one eighth of the sum of the number of moles of aspartic acid, alanine, lysine, glycine and phenylalanine as equal to one. The values fall within the following limits: aspartic acid 0.95 to 1.05; glycine 0.95 to 1.05; alanine 0.95 to 1.05; phenylalanine 2.85 to 3.15; serine 0.7 to 1.05; threonine 1.4 to 2.1; half-cystine 1.4 to 2.1; lysine 1.9 to 2.1. Not more than traces of other amino acids are present.

Related peptides. Liquid chromatography (2.2.29): use the normalisation procedure.

Test solution. Dissolve 5.0 mg of the substance to be examined in *water R* and dilute to 10.0 ml with the same solvent.

Column:

- size: $l = 0.05\text{ m}$, $\varnothing = 4.6\text{ mm}$,
- stationary phase: octadecylsilyl silica gel for chromatography *R* (5 μm).

Mobile phase:

- mobile phase A: dilute 11 ml of *phosphoric acid R* with *water R*, adjust to pH 2.3 with *triethylamine R* and dilute to 1000 ml with *water R*,
- mobile phase B: acetonitrile for chromatography *R*,

Time (min)	Mobile phase A (per cent <i>V/V</i>)	Mobile phase B (per cent <i>V/V</i>)
0 - 18	79 → 60	21 → 40
18 - 20	60	40
20 - 21	60 → 79	40 → 21
21 - 26	79	21

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 215 nm.

Injection: 25 μl .

Limits:

- any impurity: maximum 1 per cent,
- total: maximum 2 per cent,
- disregard limit: 0.03 per cent.

Acetic acid (2.5.34): 3.0 per cent to 15.0 per cent.

Test solution. Dissolve 7.0 mg of the substance to be examined in a mixture of 5 volumes of mobile phase B and 95 volumes of mobile phase A and dilute to 10.0 ml with the same mixture of solvents.

Water (2.5.12): maximum 8.0 per cent, determined on 10.0 mg.

Bacterial endotoxins (2.6.14): less than 10 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (2.2.29).

Test solution. Dissolve 5.0 mg of the substance to be examined in *water R* and dilute to 10.0 ml with the same solvent.

Reference solution. Dissolve the contents of a vial of *somatostatin CRS* in *water R* and dilute with the same solvent to obtain a final concentration of 0.5 mg/ml.

Column:

- size: $l = 0.05\text{ m}$, $\varnothing = 4.6\text{ mm}$,
- stationary phase: octadecylsilyl silica gel for chromatography *R* (5 μm).

Mobile phase: mix 25 volumes of mobile phase B and 75 volumes of mobile phase A,

- mobile phase A: dilute 11 ml of *phosphoric acid R* with *water R*, adjust to pH 2.3 with *triethylamine R* and dilute to 1000 ml with *water R*,
- mobile phase B: acetonitrile for chromatography *R*.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 215 nm.

Injection: 25 μl .

Run time: 15 min.

Calculate the content of somatostatin ($\text{C}_{76}\text{H}_{104}\text{N}_{18}\text{O}_{19}\text{S}_2$) using the chromatograms obtained with the test solution and the reference solution and the declared content of $\text{C}_{76}\text{H}_{104}\text{N}_{18}\text{O}_{19}\text{S}_2$ in *somatostatin CRS*.

STORAGE

In an airtight container protected from light, at a temperature of 2°C to 8°C . If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

SOMATROPIN

Somatropinum

M_r 22 125

DEFINITION

Somatropin is a protein having the structure (191 amino-acid residues) of the major component of growth hormone produced by the human pituitary. It contains not less than 91.0 per cent and not more than the equivalent of 105.0 per cent of somatropin⁽¹⁾ ($\text{C}_{990}\text{H}_{1528}\text{N}_{262}\text{O}_{300}\text{S}_7$), calculated with reference to the anhydrous substance.

PRODUCTION

Somatropin is produced by a method based on recombinant DNA (rDNA) technology. During the course of product development, it must be demonstrated that the manufacturing process produces a product having a biological activity of not less than 2.5 IU/mg, using a validated bioassay based on growth promotion and approved by the competent authority.

Somatropin complies with the following additional requirements.

(1) 1 mg of anhydrous somatropin ($\text{C}_{990}\text{H}_{1528}\text{N}_{262}\text{O}_{300}\text{S}_7$) is equivalent to 3.0 IU of biological activity.

Host-cell-derived proteins. The limit is approved by the competent authority.

Host-cell- and vector-derived DNA. The limit is approved by the competent authority.

CHARACTERS

A white or almost white powder.

IDENTIFICATION

- A. Examine the electropherograms obtained in the test for isoform distribution. In the electropherogram obtained with test solution (a), the principal band corresponds in position to that in the electropherogram obtained with reference solution (a).
- B. Examine the chromatograms obtained in the test for related proteins. The retention time of the principal peak in the chromatogram obtained with the test solution is similar to that of the principal peak in the chromatogram obtained with the reference solution.
- C. Examine by peptide mapping.

Test solution. Prepare a solution of the substance to be examined in 0.05 M tris-hydrochloride buffer solution pH 7.5 R to obtain a solution containing 2.0 mg/ml of somatropin and transfer about 1.0 ml to a tube made from suitable material such as polypropylene. Prepare a 1 mg/ml solution of *trypsin for peptide mapping R* in 0.05 M tris-hydrochloride buffer solution pH 7.5 R and add 30 µl to the solution of the substance to be examined. Cap the tube and place in a water-bath at 37 °C for 4 h. Remove from the water-bath and stop the reaction immediately, for example by freezing. If analysed immediately using an automatic injector, maintain the temperature at 2 °C to 8 °C.

Reference solution. Prepare at the same time and in the same manner as for the test solution but using *somatropin CRS* instead of the substance to be examined.

Examine by liquid chromatography (2.2.29).

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 µm to 10 µm),
- as mobile phase at a flow rate of 1 ml/min:

Mobile phase A. Dilute 1 ml of *trifluoroacetic acid R* to 1000 ml with *water R*,

Mobile phase B. To 100 ml of *water R* add 1 ml of *trifluoroacetic acid R* and dilute to 1000 ml with *acetonitrile for chromatography R*,

following the elution conditions as described in the table below (if necessary, the gradient or the temperature of the column may be modified to improve separation of the digest):

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 – 20	100 → 80	0 → 20
20 - 40	80 → 75	20 → 25
40 - 65	75 → 50	25 → 50
65 - 70	50 → 20	50 → 80
70 - 71	20 → 100	80 → 0
71 - 85	100	0

- as detector a spectrophotometer set at 214 nm,

maintaining the temperature of the column at 30 °C.

Equilibrate the column with mobile phase A for at least 15 min. Carry out a blank run using the above-mentioned gradient.

Inject 100 µl of the test solution and 100 µl of the reference solution. The test is not valid unless the chromatogram obtained with each solution is qualitatively similar to the chromatogram of somatropin digest supplied with *somatropin CRS*. The profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.

- D. Examine the chromatograms obtained in the assay. The retention time of the principal peak in the chromatogram obtained with the test solution is similar to that of the principal peak in the chromatogram obtained with the reference solution.

TESTS

Related proteins. Examine by liquid chromatography (2.2.29).

Test solution. Prepare a solution of the substance to be examined in 0.05 M tris-hydrochloride buffer solution pH 7.5 R, containing 2.0 mg/ml of somatropin.

Reference solution. Prepare a solution of *somatropin CRS* in 0.05 M tris-hydrochloride buffer solution pH 7.5 R, containing 2.0 mg/ml of somatropin.

Resolution solution (somatropin/desamido-somatropin resolution mixture). Prepare a solution of *somatropin CRS* in 0.05 M tris-hydrochloride buffer solution pH 7.5 R to obtain a 2.0 mg/ml solution of somatropin. Either filter through a sterile filter or add *sodium azide R* to a concentration of 0.1 mg/ml and allow to stand at room temperature for 24 h.

Maintain the solutions at 2 °C to 8 °C and use within 24 h. If an automatic injector is used, maintain the temperature at 2 °C to 8 °C.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with a suitable singly end-capped butylsilyl silica gel, with a granulometry of 5 µm and a porosity of 30 nm. A silica saturation column is to be placed between the pump and the injector valve,
- as mobile phase at a flow rate of 0.5 ml/min a mixture of 29 volumes of *propanol R* and 71 volumes of 0.05 M tris-hydrochloride buffer solution pH 7.5 R,
- as detector a spectrophotometer set at 220 nm,

maintaining the temperature of the column at 45 °C.

Prior to use, rinse the column with 200 ml to 500 ml of a 0.1 per cent V/V solution of *trifluoroacetic acid R* in a 50 per cent V/V solution of *acetonitrile R*. Repeat as necessary, to improve column performance.

Inject 20 µl of the reference solution. If necessary, adjust the concentration of *propanol R* in the mobile phase so that the retention time of the principal peak is about 33 min.

Inject 20 µl of the resolution solution. Desamido-somatropin appears as a small peak at a retention time of about 0.85 relative to the principal peak. The test is not valid unless the resolution between the peaks corresponding to somatropin and desamido-somatropin is at least 1.0 and the symmetry factor of the somatropin peak is 0.9 to 1.8.

Inject 20 µl of the test solution. In the chromatogram obtained, the sum of the areas of all the peaks, apart from the principal peak, is not greater than 6.0 per cent of the total area of the peaks. Disregard any peak due to the solvent.

Dimer and related substances of higher molecular mass.

Examine by size-exclusion chromatography (2.2.30) as described under Assay.

Inject 20 µl of the test solution. In the chromatogram obtained with the test solution, the sum of the areas of any peak with a retention time less than that of the principal peak is not greater than 4.0 per cent of the total area of the peaks. Disregard any peak due to the solvent.

Isoform distribution. Examine by isoelectric focusing.

Test solution (a). Prepare a solution of the substance to be examined in 0.025 M phosphate buffer solution pH 7.0 R, containing 2.0 mg/ml of somatropin.

Test solution (b). Add 0.1 ml of test solution (a) to 1.9 ml of 0.025 M phosphate buffer solution pH 7.0 R.

Reference solution (a). Prepare a solution of somatropin CRS in 0.025 M phosphate buffer solution pH 7.0 R, containing 2.0 mg/ml of somatropin.

Reference solution (b). Use an isoelectric point calibration solution in the pH range of 2.5 to 6.5, prepared and used according to the manufacturer's instructions.

Operate the apparatus in accordance with the manufacturer's instructions. The isoelectric focusing procedure may be carried out using a pre-cast gel 245 mm × 110 mm × 1 mm, with a pH in the range 4.0 to 6.5. Apply to the gel 15 µl of each solution. Use as the anode solution a 14.7 g/l solution of glutamic acid R in phosphoric acid (50 g/l H₃PO₄) and as the cathode solution an 89.1 g/l solution of β-alanine R. Adjust the operating conditions to 2000 V and 25 mA. Allow focusing to take place for 2.5 h at a constant voltage and at a power of not more than 25 W. Immerse the gel for 30 min in a solution containing 115 g/l of trichloroacetic acid R and 34.5 g/l of sulphosalicylic acid R, and then for 5 min in a mixture of 8 volumes of acetic acid R, 25 volumes of ethanol R and 67 volumes of deionised water R (de-stain solution). Stain the gel by immersion in a 1.15 g/l solution of acid blue 83 R in de-stain solution at 60 °C for 10 min, and then place the gel in de-stain solution until excess stain is removed.

The test is not valid unless the distribution of bands in the electropherogram obtained with reference solution (b) corresponds to the manufacturer's indications. The electropherogram obtained with reference solution (a) contains a major band with an isoelectric point of approximately five, and a slightly more acidic minor band at approximately 4.8. In the electropherogram obtained with test solution (a), no band apart from the major band is more intense than the major band in the electropherogram obtained with test solution (b) (5 per cent).

Water (2.5.32). Not more than 10.0 per cent, determined by the micro determination of water.

Bacterial endotoxins (2.6.14): less than 5 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for removal of bacterial endotoxins.

ASSAY

Examine by size-exclusion chromatography (2.2.30).

Test solution. Prepare a solution of the substance to be examined in 0.025 M phosphate buffer solution pH 7.0 R, containing 1.0 mg/ml of somatropin.

Reference solution. Dissolve the contents of a vial of somatropin CRS in 0.025 M phosphate buffer solution pH 7.0 R and dilute with the same solvent to obtain a concentration of 1.0 mg/ml.

Resolution solution. Place one vial of somatropin CRS in an oven at 50 °C for a period (typically between 12 and 24 h) sufficient to generate 1 per cent to 2 per cent of dimer. Dissolve its contents in 0.025 M phosphate buffer solution pH 7.0 R and dilute with the same solvent to obtain a concentration of 1.0 mg/ml.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.30 m long and 7.8 mm in internal diameter packed with hydrophilic silica gel for chromatography R of a grade suitable for fractionation of globular proteins in the molecular mass range 5000 to 150 000,
- as mobile phase at a flow rate of 0.6 ml/min a mixture (filtered and degassed) consisting of 3 volumes of 2-propanol R and 97 volumes of 0.063 M phosphate buffer solution pH 7.0 R,
- as detector a spectrophotometer set at 214 nm.

Inject 20 µl of the resolution solution. In the chromatogram obtained, the main peak elutes at a retention time of approximately 12 min to 17 min and the peaks corresponding to the somatropin dimer and to the higher molecular weight proteins at relative retention times of 0.90 and 0.65 respectively, relative to the main peak. The resolution, defined by the ratio of the height above the baseline of the valley separating the monomer and dimer peaks to the height of the dimer peak, is not greater than 0.4.

Inject 20 µl of the test solution and 20 µl of the reference solution.

Calculate the content of somatropin (C₉₉₀H₁₅₂₈N₂₆₂O₃₀₀S₇) from the peak areas in the chromatograms obtained with the test solution and the reference solution and the declared content of (C₉₉₀H₁₅₂₈N₂₆₂O₃₀₀S₇) in somatropin CRS.

STORAGE

Store in an airtight container at a temperature of 2 °C to 8 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

01/2005:0950
corrected

SOMATROPIN BULK SOLUTION**Somatropini solutio ad praeparationem****DEFINITION**

Somatropin bulk solution is a solution containing a protein having the structure (191 amino-acid residues) of the major component of growth hormone produced by the human pituitary. It may contain buffer salts and other auxiliary substances. It contains not less than 91.0 per cent and not more than 105.0 per cent of the amount of somatropin⁽²⁾ (C₉₉₀H₁₅₂₈N₂₆₂O₃₀₀S₇) stated on the label.

PRODUCTION

Somatropin bulk solution is produced by a method based on recombinant DNA (rDNA) technology. During the course of product development, it must be demonstrated that the manufacturing process produces a product having a biological activity of at least 2.5 IU/mg, using a validated bioassay based on growth promotion and approved by the competent authority.

(2) 1 mg of anhydrous somatropin (C₉₉₀H₁₅₂₈N₂₆₂O₃₀₀S₇) is equivalent to 3.0 IU of biological activity.

Somatropin bulk solution complies with the following additional requirements.

Host-cell-derived proteins. The limit is approved by the competent authority.

Host-cell- and vector-derived DNA. The limit is approved by the competent authority.

CHARACTERS

A clear or slightly turbid, colourless solution.

IDENTIFICATION

- Examine the electropherograms obtained in the test for isoform distribution. In the electropherogram obtained with test solution (a), the principal band corresponds in position to that in the electropherogram obtained with reference solution (a).
- Examine the chromatograms obtained in the test for related proteins. The retention time of the principal peak in the chromatogram obtained with the test solution is similar to that of the principal peak in the chromatogram obtained with the reference solution.
- Examine by peptide mapping.

Test solution. Dilute the solution to be examined with 0.05 M tris-hydrochloride buffer solution pH 7.5 R so that it contains 2.0 mg/ml of somatropin, and transfer about 1.0 ml to a tube made from suitable material such as polypropylene. Prepare a 1 mg/ml solution of *trypsin for peptide mapping R* in 0.05 M tris-hydrochloride buffer solution pH 7.5 R and add 30 µl to the solution of the substance to be examined. Cap the tube and place in a water-bath at 37 °C for 4 h. Remove from the water-bath and stop the reaction immediately, for example by freezing. If analysed immediately using an automatic injector, maintain the temperature at 2 °C to 8 °C.

Note: If a 2 mg/ml somatropin concentration is not obtainable, a similar digest relationship (µg of *trypsin* per mg of somatropin) may be used.

Reference solution. Prepare a solution of somatropin CRS in 0.05 M tris-hydrochloride buffer solution pH 7.5 R containing 2.0 mg/ml of somatropin and treat at the same time and in the same manner as for the test solution.

Examine by liquid chromatography (2.2.29).

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 µm to 10 µm),
- as mobile phase at a flow rate of 1 ml/min:

Mobile phase A. Dilute 1 ml of *trifluoroacetic acid R* to 1000 ml with *water R*,

Mobile phase B. To 100 ml of *water R* add 1 ml of *trifluoroacetic acid R* and dilute to 1000 ml with *acetonitrile for chromatography R*,

following the elution conditions as described in the table below (if necessary, the gradient or the temperature of the column may be modified to improve separation of the digest):

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 – 20	100 → 80	0 → 20
20 – 40	80 → 75	20 → 25
40 – 65	75 → 50	25 → 50
65 – 70	50 → 20	50 → 80
70 – 71	20 → 100	80 → 0
71 – 85	100	0

- as detector a spectrophotometer set at 214 nm, maintaining the temperature of the column at 30 °C.

Equilibrate the column with mobile phase A for at least 15 min. Carry out a blank run using the above-mentioned gradient.

Inject 100 µl of the test solution and 100 µl of the reference solution. The test is not valid unless the chromatogram obtained with each solution is qualitatively similar to the chromatogram of somatropin digest supplied with *somatropin CRS*. The profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.

- Examine the chromatograms obtained in the assay. The retention time of the principal peak in the chromatogram obtained with the test solution is similar to that of the principal peak in the chromatogram obtained with the reference solution.

TESTS

Related proteins. Examine by liquid chromatography (2.2.29).

Test solution. Dilute the solution to be examined with 0.05 M tris-hydrochloride buffer solution pH 7.5 R so as to contain 2.0 mg/ml of somatropin or less, but then correct the injection volume accordingly.

Reference solution. Prepare a solution of *somatropin CRS* in 0.05 M tris-hydrochloride buffer solution pH 7.5 R, containing 2.0 mg/ml of somatropin.

Resolution solution (somatropin/desamido-somatropin resolution mixture). Prepare a solution of *somatropin CRS* in 0.05 M tris-hydrochloride buffer solution pH 7.5 R, containing 2.0 mg/ml of somatropin. Either filter through a sterile filter or add *sodium azide R* to a concentration of 0.1 mg/ml and allow to stand at room temperature for 24 h.

Maintain the solutions at 2 °C to 8 °C and use within 24 h. If an automatic injector is used, maintain the temperature at 2 °C to 8 °C.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with a suitable singly end-capped butylsilyl silica gel, with a granulometry of 5 µm and a porosity of 30 nm. A silica saturation column is to be placed between the pump and the injector valve,
- as mobile phase at a flow rate of 0.5 ml/min a mixture of 29 volumes of *propanol R* and 71 volumes of 0.05 M tris-hydrochloride buffer solution pH 7.5 R,
- as detector a spectrophotometer set at 220 nm, maintaining the temperature of the column at 45 °C.

Prior to use, rinse the column with 200 ml to 500 ml of a 0.1 per cent V/V solution of *trifluoroacetic acid R* in a 50 per cent V/V solution of *acetonitrile R*. Repeat as necessary, to improve column performance.

Inject 20 µl of the reference solution. If necessary, adjust the concentration of *propanol R* in the mobile phase so that the retention time of the principal peak is about 33 min.

Inject 20 µl of the resolution solution. Desamido-somatropin appears as a small peak at a retention time of about 0.85 relative to the principal peak. The test is not valid unless the resolution between the peaks corresponding to somatropin and desamido-somatropin is at least 1.0 and the symmetry factor of the somatropin peak is 0.9 to 1.8.

Inject 20 µl of the test solution. In the chromatogram obtained, the sum of the areas of all the peaks, apart from the principal peak, is not greater than 6.0 per cent of the total area of the peaks. Disregard any peak due to the solvent.

Dimer and related substances of higher molecular mass.

Examine by size-exclusion chromatography (2.2.30) as described under Assay.

Inject 20 µl of the test solution. In the chromatogram obtained with the test solution, the sum of the areas of any peak with a retention time less than that of the principal peak is not greater than 4.0 per cent of the total area of the peaks. Disregard any peak due to the solvent.

Isoform distribution. Examine by isoelectric focusing.

Test solution (a). Dilute the solution to be examined with 0.025 M phosphate buffer solution pH 7.0 R so as to contain 2.0 mg/ml of somatropin.

Test solution (b). Add 0.1 ml of test solution (a) to 1.9 ml of 0.025 M phosphate buffer solution pH 7.0 R.

Reference solution (a). Prepare a solution of somatropin CRS in 0.025 M phosphate buffer solution pH 7.0 R, containing 2.0 mg/ml of somatropin.

Reference solution (b). Use an isoelectric point calibration solution in the pH range of 2.5 to 6.5, prepared and used according to the manufacturer's instructions.

Operate the apparatus in accordance with the manufacturer's instructions. The isoelectric focusing procedure may be carried out using a pre-cast gel 245 mm × 110 mm × 1 mm, with a pH in the range 4.0 to 6.5. Apply to the gel 15 µl of each solution. Use as the anode solution a 14.7 g/l solution of glutamic acid R in phosphoric acid (50 g/l H₃PO₄) and as the cathode solution an 89.1 g/l solution of β-alanine R. Adjust the operating conditions to 2000 V and 25 mA. Allow focusing to take place for 2.5 h at a constant voltage and at a power of not more than 25 W. Immerse the gel for 30 min in a solution containing 115 g/l of trichloroacetic acid R and 34.5 g/l of sulphosalicylic acid R, and then for 5 min in a mixture of 8 volumes of acetic acid R, 25 volumes of ethanol R and 67 volumes of deionised water R (de-stain solution). Stain the gel by immersion in a 1.15 g/l solution of acid blue 83 R in de-stain solution at 60 °C for 10 min, and then place the gel in de-stain solution until excess stain is removed.

The test is not valid unless the distribution of bands in the electropherogram obtained with reference solution (b) corresponds to the manufacturer's indications. The electropherogram obtained with reference solution (a) contains a major band with an isoelectric point of approximately five, and a slightly more acidic minor band at approximately 4.8. In the electropherogram obtained with test solution (a), no band apart from the major band is more intense than the major band in the electropherogram obtained with test solution (b) (5 per cent).

Bacterial endotoxins (2.6.14): less than 5 IU in the volume that contains 1 mg of somatropin, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for removal of bacterial endotoxins.

ASSAY

Examine by size-exclusion chromatography (2.2.30).

Test solution. Dilute the solution to be examined with 0.025 M phosphate buffer solution pH 7.0 R so as to contain 1.0 mg/ml of somatropin.

Reference solution. Dissolve the contents of a vial of somatropin CRS in 0.025 M phosphate buffer solution pH 7.0 R and dilute with the same solvent to obtain a concentration of 1.0 mg/ml.

Resolution solution. Place one vial of somatropin CRS in an oven at 50 °C for a period (typically between 12 h and 24 h) sufficient to generate 1 per cent to 2 per cent of dimer. Dissolve its contents in 0.025 M phosphate buffer solution pH 7.0 R and dilute with the same solvent to obtain a concentration of 1.0 mg/ml.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.30 m long and 7.8 mm in internal diameter packed with hydrophilic silica gel for chromatography R of a grade suitable for fractionation of globular proteins in the molecular mass range 5000 to 150 000,
- as mobile phase at a flow rate of 0.6 ml/min a mixture (filtered and degassed) consisting of 3 volumes of 2-propanol R and 97 volumes of 0.063 M phosphate buffer solution pH 7.0 R,
- as detector a spectrophotometer set at 214 nm.

Inject 20 µl of the resolution solution. In the chromatogram obtained, the main peak elutes at a retention time of approximately 12 min to 17 min and the peaks corresponding to the somatropin dimer and to the higher molecular weight proteins at relative retention times of 0.90 and 0.65 respectively, relative to the main peak. The resolution, defined by the ratio of the height above the baseline of the valley separating the monomer and dimer peaks to the height of the dimer peak, is not greater than 0.4.

Inject 20 µl of the test solution and 20 µl of the reference solution.

Calculate the content of somatropin (C₉₉₀H₁₅₂₈N₂₆₂O₃₀₀S₇) from the peak areas in the chromatograms obtained with the test solution and the reference solution and the declared content of (C₉₉₀H₁₅₂₈N₂₆₂O₃₀₀S₇) in somatropin CRS.

STORAGE

Store in an airtight container at a temperature of –20 °C. Avoid repeated freezing and thawing. If the solution is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states:

- the content of somatropin in milligrams per millilitre,
- the name and concentration of any auxiliary substance,
- where applicable, that the solution is free from bacterial endotoxins.

corrected

SOMATROPIN FOR INJECTION

Somatropinum ad iniectabilium

DEFINITION

Somatropin for injection is a freeze-dried, sterile preparation of a protein having the structure (191 amino-acid residues) of the major component of growth hormone produced by the human pituitary. It contains not less than 89.0 per cent and not more than 105.0 per cent of the amount of

somatropin⁽³⁾ (C₉₉₀H₁₅₂₈N₂₆₂O₃₀₀S₇) stated on the label. It complies with the requirements of the monographs on *Parenteral preparations* (0520).

PRODUCTION

Somatropin for injection is prepared either from *Somatropin* (0951) or from *Somatropin bulk solution* (0950), or by a method based on recombinant DNA (rDNA) technology in which the injectable preparation is produced without the isolation of an intermediate solid or liquid bulk. In the latter case, during the course of product development, it must be demonstrated that the manufacturing process produces a product having a biological activity of not less than 2.5 IU/mg, using a validated bioassay based on growth promotion and approved by the competent authority. The purified preparation, to which buffers and stabilisers may be added, is filtered through a bacteria-retentive filter, aseptically distributed in sterile containers of glass type I (3.2.1) and freeze-dried. The containers are immediately sealed so as to exclude microbial contamination and moisture.

Somatropin for injection complies with the following additional requirements.

Host-cell-derived proteins. The limit is approved by the competent authority.

Host-cell- and vector-derived DNA. The limit is approved by the competent authority.

Where somatropin for injection is prepared from *Somatropin* (0951) or from *Somatropin bulk solution* (0950), compliance with the requirements for host-cell-derived proteins, host-cell- and vector-derived DNA and with identification test C need not be reconfirmed by the manufacturer during subsequent production of somatropin for injection.

CHARACTERS

A white or almost white powder.

IDENTIFICATION

- A. Examine the electropherograms obtained in the test for isoform distribution. In the electropherogram obtained with test solution (a), the principal band corresponds in position to that in the electropherogram obtained with reference solution (a).
- B. Examine the chromatograms obtained in the test for related proteins. The retention time of the principal peak in the chromatogram obtained with the test solution is similar to that of the principal peak in the chromatogram obtained with the reference solution.

- C. Examine by peptide mapping.

Test solution. Prepare a solution of the substance to be examined in 0.05 M tris-hydrochloride buffer solution pH 7.5 R to obtain a solution containing 2.0 mg/ml of somatropin, and transfer about 1.0 ml to a tube made from suitable material such as polypropylene. Prepare a 1 mg/ml solution of *trypsin for peptide mapping R* in 0.05 M tris-hydrochloride buffer solution pH 7.5 R and add 30 µl to the solution of the substance to be examined. Cap the tube and place in a water-bath at 37 °C for 4 h. Remove from the water-bath and stop the reaction immediately, for example by freezing. If analysed immediately using an automatic injector, maintain the temperature at 2 °C to 8 °C.

Reference solution. Prepare at the same time and in the same manner as for the test solution but using *somatropin CRS* instead of the substance to be examined.

Examine by liquid chromatography (2.2.29).

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 µm to 10 µm),
- as mobile phase at a flow rate of 1 ml/min:

Mobile phase A. Dilute 1 ml of *trifluoroacetic acid R* to 1000 ml with *water R*,

Mobile phase B. To 100 ml of *water R* add 1 ml of *trifluoroacetic acid R* and dilute to 1000 ml with *acetonitrile for chromatography R*,

following the elution conditions as described in the table below (if necessary, the gradient or the temperature of the column may be modified to improve separation of the digest):

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 – 20	100 → 80	0 → 20
20 – 40	80 → 75	20 → 25
40 – 65	75 → 50	25 → 50
65 – 70	50 → 20	50 → 80
70 – 71	20 → 100	80 → 0
71 – 85	100	0

- as detector a spectrophotometer set at 214 nm, maintaining the temperature of the column at 30 °C.

Equilibrate the column with mobile phase A for at least 15 min. Carry out a blank run using the above-mentioned gradient.

Inject 100 µl of the test solution and 100 µl of the reference solution. The test is not valid unless the chromatogram obtained with each solution is qualitatively similar to the chromatogram of somatropin digest supplied with *somatropin CRS*. The profile of the chromatogram obtained with the test solution corresponds to that of the chromatogram obtained with the reference solution.

- D. Examine the chromatograms obtained in the assay. The retention time of the principal peak in the chromatogram obtained with the test solution is similar to that of the principal peak in the chromatogram obtained with the reference solution.

TESTS

Related proteins. Examine by liquid chromatography (2.2.29).

Test solution. Prepare a solution of the substance to be examined in 0.05 M tris-hydrochloride buffer solution pH 7.5 R, containing 2.0 mg/ml of somatropin.

Reference solution. Prepare a solution of *somatropin CRS* in 0.05 M tris-hydrochloride buffer solution pH 7.5 R, containing 2.0 mg/ml of somatropin.

Resolution solution (somatropin/desamido-somatropin resolution mixture). Prepare a solution of *somatropin CRS* in 0.05 M tris-hydrochloride buffer solution pH 7.5 R, containing 2.0 mg/ml of somatropin. Either filter through a sterile filter or add *sodium azide R* to a concentration of 0.1 mg/ml and allow to stand at room temperature for 24 h.

Maintain the solutions at 2 °C to 8 °C and use within 24 h. If an automatic injector is used, maintain the temperature at 2 °C to 8 °C.

(3) 1 mg of anhydrous somatropin (C₉₉₀H₁₅₂₈N₂₆₂O₃₀₀S₇) is equivalent to 3.0 IU of biological activity.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with a suitable singly end-capped butylsilyl silica gel, with a granulometry of 5 µm and a porosity of 30 nm. A silica saturation column is to be placed between the pump and the injector valve,
- as mobile phase at a flow rate of 0.5 ml/min a mixture of 29 volumes of *propanol R* and 71 volumes of 0.05 M *tris-hydrochloride buffer solution pH 7.5 R*,
- as detector a spectrophotometer set at 220 nm, maintaining the temperature of the column at 45 °C.

Prior to use, rinse the column with 200 ml to 500 ml of a 0.1 per cent V/V solution of *trifluoroacetic acid R* in a 50 per cent V/V solution of *acetonitrile R*. Repeat as necessary, to improve column performance.

Inject 20 µl of the reference solution. If necessary, adjust the concentration of *propanol R* in the mobile phase so that the retention time of the principal peak is about 33 min.

Inject 20 µl of the resolution solution. Desamido-somatropin appears as a small peak at a retention time of about 0.85 relative to the principal peak. The test is not valid unless the resolution between the peaks corresponding to somatropin and desamido-somatropin is at least 1.0 and the symmetry factor of the somatropin peak is 0.9 to 1.8.

Inject 20 µl of the test solution. In the chromatogram obtained, the sum of areas of all the peaks, apart from the principal peak, is not greater than 13 per cent of the total area of the peaks. Disregard any peak due to the solvent.

Dimer and related substances of higher molecular mass.

Examine by size-exclusion chromatography (2.2.30) as described under Assay.

Inject 20 µl of the test solution. In the chromatogram obtained with the test solution, the sum of the areas of any peak with a retention time less than that of the principal peak is not greater than 6.0 per cent of the total area of the peaks. Disregard any peak due to the solvent.

Isoform distribution. Examine by isoelectric focusing.

Test solution (a). Prepare a solution of the substance to be examined in 0.025 M *phosphate buffer solution pH 7.0 R*, containing 2.0 mg/ml of somatropin.

Test solution (b). Add 0.1 ml of test solution (a) to 1.5 ml of 0.025 M *phosphate buffer solution pH 7.0 R*.

Reference solution (a). Prepare a solution of *somatropin CRS* in 0.025 M *phosphate buffer solution pH 7.0 R*, containing 2.0 mg/ml of somatropin.

Reference solution (b). Use an isoelectric point calibration solution in the pH range of 2.5 to 6.5, prepared and used according to the manufacturer's instructions.

Operate the apparatus in accordance with the manufacturer's instructions. The isoelectric focusing procedure may be carried out using a pre-cast gel 245 mm × 110 mm × 1 mm, with a pH in the range 4.0 to 6.5. Apply to the gel 15 µl of each solution. Use as the anode solution a 14.7 g/l solution of *glutamic acid R* in phosphoric acid (50 g/l H_3PO_4) and as the cathode solution an 89.1 g/l solution of *β-alanine R*. Adjust the operating conditions to 2000 V and 25 mA. Allow focusing to take place for 2.5 h at a constant voltage and at a power of not more than 25 W. Immerse the gel for 30 min in a solution containing 115 g/l of *trichloroacetic acid R* and 34.5 g/l of *sulphosalicylic acid R*, and then for 5 min in a mixture of 8 volumes of *acetic acid R*, 25 volumes of *ethanol R* and 67 volumes of deionised *water R* (de-stain solution). Stain the gel by immersion in a 1.15 g/l solution of *acid blue 83 R* in de-stain solution at 60 °C for 10 min, and then place the gel in de-stain solution until excess stain is removed.

The test is not valid unless the distribution of bands in the electropherogram obtained with reference solution (b) corresponds to the manufacturer's indications. The electropherogram obtained with reference solution (a) contains a major band with an isoelectric point of approximately five, and a slightly more acidic minor band at approximately 4.8. In the electropherogram obtained with test solution (a), no band apart from the major band is more intense than the major band in the electropherogram obtained with test solution (b) (6.25 per cent).

Water (2.5.32). Not more than 3.0 per cent, unless otherwise justified and authorised, determined by the micro determination of water.

Bacterial endotoxins (2.6.14): less than 5 IU/mg.

ASSAY

Examine by size-exclusion chromatography (2.2.30).

Test solution. Prepare a solution of the substance to be examined in 0.025 M *phosphate buffer solution pH 7.0 R*, containing 1.0 mg/ml of somatropin.

Reference solution. Dissolve the contents of a vial of *somatropin CRS* in 0.025 M *phosphate buffer solution pH 7.0 R* and dilute with the same solvent to obtain a concentration of 1.0 mg/ml.

Resolution solution. Place one vial of *somatropin CRS* in an oven at 50 °C for a period (typically between 12 h and 24 h) sufficient to generate 1 per cent to 2 per cent of dimer. Dissolve its contents in 0.025 M *phosphate buffer solution pH 7.0 R* and dilute with the same solvent to obtain a concentration of 1.0 mg/ml.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.30 m long and 7.8 mm in internal diameter packed with *hydrophilic silica gel for chromatography R* of a grade suitable for fractionation of globular proteins in the molecular mass range 5000 to 150 000,
- as mobile phase at a flow rate of 0.6 ml/min a mixture (filtered and degassed) consisting of 3 volumes of 2-propanol *R* and 97 volumes of 0.063 M *phosphate buffer solution pH 7.0 R*,
- as detector a spectrophotometer set at 214 nm.

Inject 20 µl of the resolution solution. In the chromatogram obtained, the main peak elutes at a retention time of approximately 12 min to 17 min and the peaks corresponding to the somatropin dimer and to the higher molecular weight proteins at relative retention times of 0.90 and 0.65 respectively, relative to the main peak. The resolution defined by the ratio of the height above the baseline of the valley separating the monomer and dimer peaks, to the height of the dimer peak, is not greater than 0.4.

Inject 20 µl of the test solution and 20 µl of the reference solution.

Calculate the content of somatropin ($\text{C}_{990}\text{H}_{1528}\text{N}_{262}\text{O}_{300}\text{S}_7$) from the peak areas in the chromatograms obtained with the test solution and the reference solution and the declared content of ($\text{C}_{990}\text{H}_{1528}\text{N}_{262}\text{O}_{300}\text{S}_7$) in *somatropin CRS*.

STORAGE

Store in a sterile, airtight, tamper-proof container, at a temperature of 2 °C to 8 °C.

LABELLING

The label states:

- the content of somatropin in the container, in milligrams,
- the composition and volume of the liquid to be added for reconstitution,

- the time within which the reconstituted solution shall be used and the storage conditions during this period,
- the name and quantity of any added substance,
- the storage temperature,
- that the preparation shall not be shaken during reconstitution.

01/2005:0592

SORBIC ACID**Acidum sorbicum** $C_6H_8O_2$ M_r 112.1**DEFINITION**

Sorbic acid contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (*E,E*)-hexa-2,4-dienoic acid, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, slightly soluble in water, freely soluble in alcohol.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D.

- Melting point (2.2.14): 132 °C to 136 °C.
- Dissolve 50.0 mg in *water R* and dilute to 250.0 ml with the same solvent. Dilute 2.0 ml of this solution to 200.0 ml with 0.1 M *hydrochloric acid*. Examined between 230 nm and 350 nm (2.2.25), the solution shows a maximum at 264 nm. The specific absorbance at the maximum is 2150 to 2550.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *sorbic acid CRS*.
- Dissolve 0.2 g in 2 ml of *alcohol R* and add 0.2 ml of *bromine water R*. The solution is decolorised.

TESTS

Solution S. Dissolve 1.25 g in *alcohol R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Aldehydes. Dissolve 1.0 g in a mixture of 30 ml of *water R* and 50 ml of 2-propanol *R*, adjust the solution to pH 4 with 0.1 M *hydrochloric acid* or 0.1 M *sodium hydroxide* and dilute to 100 ml with *water R*. To 10 ml of the solution add 1 ml of *decolorised fuchsin solution R* and allow to stand for 30 min. Any colour in the solution is not more intense than that in a standard prepared at the same time by adding 1 ml of *decolorised fuchsin solution R* to a mixture of 1.5 ml of *acetaldehyde standard solution* (100 ppm C_2H_4O) *R*, 4 ml of 2-propanol *R* and 4.5 ml of *water R* (0.15 per cent, calculated as C_2H_4O).

Heavy metals (2.4.8). 12 ml of solution S complies with limit test B for heavy metals (10 ppm). Prepare the standard using 5 ml of *lead standard solution* (1 ppm Pb) *R* and 5 ml of *alcohol R*.

Water (2.5.12). Not more than 1.0 per cent, determined on 2.000 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.2 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.1000 g in 20 ml of *alcohol R*. Using 0.2 ml of *phenolphthalein solution R* as indicator, titrate with 0.1 M *sodium hydroxide* until a pink colour is obtained.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 11.21 mg of $C_6H_8O_2$.

STORAGE

Store protected from light.

01/2005:1040

SORBITAN LAURATE**Sorbitani lauras****DEFINITION**

Mixture usually obtained by partial esterification of sorbitol and its mono- and di-anhydrides with lauric acid.

CHARACTERS

Appearance: brownish-yellow, viscous liquid.

Solubility: practically insoluble, but dispersible in water, miscible with alcohol.

Relative density: about 0.98.

IDENTIFICATION

- It complies with the test for hydroxyl value (see Tests).
- It complies with the test for iodine value (see Tests).
- It complies with the test for composition of fatty acids (see Tests).

TESTS

Acid value (2.5.1): maximum 7.0, determined on 5.0 g.

Hydroxyl value (2.5.3, *Method A*): 330 to 358.

Iodine value (2.5.4): maximum 10.

Peroxide value (2.5.5): maximum 5.0.

Saponification value (2.5.6): 158 to 170.

Carry out the saponification for 1 h.

Composition of fatty acids. Gas chromatography (2.4.22, *Method C*).

Prepare reference solution (a) as indicated in tables 2.4.22-1 and 2.4.22-2.

Composition of the fatty acid fraction of the substance:

- *caproic acid*: maximum 1.0 per cent,
- *caprylic acid*: maximum 10.0 per cent,
- *capric acid*: maximum 10.0 per cent,
- *lauric acid*: 40.0 per cent to 60.0 per cent,
- *myristic acid*: 14.0 per cent to 25.0 per cent,
- *palmitic acid*: 7.0 per cent to 15.0 per cent,
- *stearic acid*: maximum 7.0 per cent,
- *oleic acid*: maximum 11.0 per cent,
- *linoleic acid*: maximum 3.0 per cent.

Heavy metals (2.4.8): maximum 10 ppm.

2.0 g complies with limit test D. Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) *R*.

Water (2.5.12): maximum 1.5 per cent, determined on 1.00 g.

Total ash (2.4.16): maximum 0.5 per cent.

STORAGE

Protected from light.

01/2005:1041

01/2005:1042

SORBITAN OLEATE**Sorbitani oleas****DEFINITION**

Mixture usually obtained by esterification of 1 mole of sorbitol and its mono- and di-anhydrides per mole of oleic acid. A suitable antioxidant may be added.

CHARACTERS

Appearance: brownish-yellow, viscous liquid.

Solubility: practically insoluble but dispersible in water, soluble in fatty oils producing a hazy solution, miscible with alcohol.

Relative density: about 0.99.

IDENTIFICATION

- A. It complies with the test for hydroxyl value (see Tests).
- B. It complies with the test for iodine value (see Tests).
- C. It complies with the test for composition of fatty acids (see Tests).

Margaric acid: maximum 0.2 per cent for oleic acid of vegetable origin and maximum 4.0 per cent for oleic acid of animal origin.

TESTS

Acid value (2.5.1): maximum 8.0, determined on 5.0 g.

Hydroxyl value (2.5.3, *Method A*): 190 to 210.

Iodine value (2.5.4): 62 to 76.

Peroxide value (2.5.5): maximum 10.0.

Saponification value (2.5.6): 145 to 160.

Carry out the saponification for 1 h.

Composition of fatty acids. Gas chromatography (2.4.22, *Method C*).

Composition of the fatty acid fraction of the substance:

- *myristic acid*: maximum 5.0 per cent,
- *palmitic acid*: maximum 16.0 per cent,
- *palmitoleic acid*: maximum 8.0 per cent,
- *stearic acid*: maximum 6.0 per cent,
- *oleic acid*: 65.0 per cent to 88.0 per cent,
- *linoleic acid*: maximum 18.0 per cent,
- *linolenic acid*: maximum 4.0 per cent,
- *fatty acids with chain length greater than C₁₈*: maximum 4.0 per cent.

Heavy metals (2.4.8): maximum 10 ppm.

2.0 g complies with limit test D. Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) R.

Water (2.5.12): maximum 1.5 per cent, determined on 1.000 g.

Total ash (2.4.16): maximum 0.5 per cent, determined on 1.5 g.

STORAGE

Protected from light.

LABELLING

The label states:

- the name and concentration of any added antioxidant,
- the origin of the oleic acid used (animal or vegetable).

SORBITAN PALMITATE**Sorbitani palmitas****DEFINITION**

Mixture usually obtained by partial esterification of sorbitol and its mono- and di-anhydrides with palmitic acid.

CHARACTERS

Appearance: yellow or yellowish powder, waxy flakes or hard masses.

Solubility: practically insoluble in water, soluble in fatty oils, slightly soluble in alcohol.

IDENTIFICATION

- A. Melting point (2.2.15): 44 °C to 51 °C.

Introduce the melted substance into the glass capillary tubes and allow to stand at a temperature below 10 °C for 24 h.

- B. It complies with the test for hydroxyl value (see Tests).
- C. It complies with the test for composition of fatty acids (see Tests).

TESTS

Acid value (2.5.1): maximum 8.0, determined on 5.0 g.

Hydroxyl value (2.5.3, *Method A*): 270 to 305.

Peroxide value (2.5.5): maximum 5.0.

Saponification value (2.5.6): 140 to 155.

Carry out the saponification for 1 h.

Composition of fatty acids. Gas chromatography (2.4.22, *Method C*).

Composition of the fatty acid fraction of the substance:

- *palmitic acid*: minimum 92.0 per cent,
- *stearic acid*: maximum 6.0 per cent.

Heavy metals (2.4.8): maximum 10 ppm.

2.0 g complies with limit test D. Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) R.

Water (2.5.12): maximum 1.5 per cent, determined on 1.00 g.

Total ash (2.4.16): maximum 0.5 per cent.

STORAGE

Protected from light.

01/2005:1916

SORBITAN SESQUIOLEATE**Sorbitani sesquioleas****DEFINITION**

Mixture usually obtained by esterification of 2 moles of sorbitol and its mono- and di-anhydrides per 3 moles of oleic acid. A suitable antioxidant may be added.

CHARACTERS

Appearance: pale yellow or slightly brownish-yellow paste, which becomes a viscous, oily, brownish-yellow liquid at about 25 °C.

Solubility: dispersible in water, soluble in fatty oils, slightly soluble in ethanol.

Relative density: about 0.99.

IDENTIFICATION

- A. It complies with the test for hydroxyl value (see Tests).
 B. It complies with the test for iodine value (see Tests).
 C. It complies with the test for composition of fatty acids (see Tests).

Margaric acid: maximum 0.2 per cent for oleic acid of vegetable origin and maximum 4.0 per cent for oleic acid of animal origin.

TESTS

Acid value (2.5.1): maximum 16.0, determined on 5.0 g.

Hydroxyl value (2.5.3, *Method A*): 180 to 215.

Iodine value (2.5.4): 70 to 95.

Peroxide value (2.5.5): maximum 10.0.

Saponification value (2.5.6): 145 to 166.

Carry out the saponification for 1 h.

Composition of fatty acids. Gas chromatography (2.4.22, *Method C*).

Composition of the fatty acid fraction of the substance:

- *myristic acid*: maximum 5.0 per cent,
- *palmitic acid*: maximum 16.0 per cent,
- *palmitoleic acid*: maximum 8.0 per cent,
- *stearic acid*: maximum 6.0 per cent,
- *oleic acid*: 65.0 per cent to 88.0 per cent,
- *linoleic acid*: maximum 18.0 per cent,
- *linolenic acid*: maximum 4.0 per cent,
- *fatty acids with chain length greater than C₁₈*: maximum 4.0 per cent.

Heavy metals (2.4.8): maximum 10 ppm.

2.0 g complies with limit test D. Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) R.

Water (2.5.12): maximum 1.5 per cent, determined on 1.000 g.

Total ash (2.4.16): maximum 0.5 per cent, determined on 1.5 g.

STORAGE

Protected from light.

LABELLING

The label states:

- the name and concentration of any added antioxidant,
- the origin of the oleic acid used (animal or vegetable).

01/2005:1043

SORBITAN STEARATE

Sorbitani stearas

DEFINITION

Mixture usually obtained by partial esterification of sorbitol and its mono- and di-anhydrides with *Stearic acid 50* (1474) or *Stearic acid 70* (1474).

CHARACTERS

Appearance: pale yellow, waxy solid.

Solubility: practically insoluble, but dispersible in water, slightly soluble in alcohol.

IDENTIFICATION

- A. Melting point (2.2.15): 50 °C to 60 °C.

Introduce the melted substance into the capillary tubes and allow to stand at a temperature below 10 °C for 24 h.

- B. It complies with the test for hydroxyl value (see Tests).
 C. It complies with the test for composition of fatty acids (see Tests).

TESTS

Acid value (2.5.1): maximum 10.0, determined on 5.0 g.

Hydroxyl value (2.5.3, *Method A*): 235 to 260.

Peroxide value (2.5.5): maximum 5.0.

Saponification value (2.5.6): 147 to 157.

Carry out the saponification for 1 h.

Composition of fatty acids. Gas chromatography (2.4.22, *Method C*).

Composition of the fatty acid fraction of the substance:

Type of fatty acid used		Composition of fatty acids
Sorbitan stearate (type I)	Stearic acid 50	<i>Stearic acid</i> : 40.0 per cent to 60.0 per cent, <i>Sum of the contents of palmitic and stearic acids</i> : minimum 90.0 per cent.
Sorbitan stearate (type II)	Stearic acid 70	<i>Stearic acid</i> : 60.0 per cent to 80.0 per cent, <i>Sum of the contents of palmitic and stearic acids</i> : minimum 90.0 per cent.

Heavy metals (2.4.8): maximum 10 ppm.

2.0 g complies with limit test D. Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) R.

Water (2.5.12): maximum 1.5 per cent, determined on 1.00 g.

Total ash (2.4.16): maximum 0.5 per cent.

STORAGE

Protected from light.

LABELLING

The label states the type of sorbitan stearate.

01/2005:1044

SORBITAN TRIOLEATE

Sorbitani trioleas

DEFINITION

Mixture usually obtained by esterification of 1 mole of sorbitol and its mono-anhydride per 3 moles of oleic acid. A suitable antioxidant may be added.

CHARACTERS

Appearance: pale yellow, light yellowish or brown solid, which becomes a viscous, oily, brownish-yellow liquid at about 25 °C.

Solubility: practically insoluble but dispersible in water, soluble in fatty oils, slightly soluble in alcohol.

Relative density: about 0.98.

IDENTIFICATION

- A. It complies with the test for hydroxyl value (see Tests).
 B. It complies with the test for iodine value (see Tests).
 C. It complies with the test for composition of fatty acids (see Tests).

Margaric acid: maximum 0.2 per cent for oleic acid of vegetable origin and maximum 4.0 per cent for oleic acid of animal origin.

TESTS

Acid value (2.5.1): maximum 16.0, determined on 5.0 g.

Hydroxyl value (2.5.3, Method A): 55 to 75.

Iodine value (2.5.4): 76 to 90.

Peroxide value (2.5.5): maximum 10.0.

Saponification value (2.5.6): 170 to 190.

Carry out the saponification for 1 h.

Composition of fatty acids. Gas chromatography (2.4.22, Method C).

Composition of the fatty acid fraction of the substance:

- *myristic acid*: maximum 5.0 per cent,
- *palmitic acid*: maximum 16.0 per cent,
- *palmitoleic acid*: maximum 8.0 per cent,
- *stearic acid*: maximum 6.0 per cent,
- *oleic acid*: 65.0 per cent to 88.0 per cent,
- *linoleic acid*: maximum 18.0 per cent,
- *linolenic acid*: maximum 4.0 per cent,
- *fatty acids with chain length greater than C₁₈*: maximum 4.0 per cent.

Heavy metals (2.4.8): maximum 10 ppm.

2.0 g complies with limit test D. Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) R.

Water (2.5.12): maximum 1.5 per cent, determined on 1.000 g.

Total ash (2.4.16): maximum 0.5 per cent, determined on 1.5 g.

STORAGE

Protected from light.

LABELLING

The label states:

- the name and concentration of any added antioxidant,
- the origin of the oleic acid used (animal or vegetable).

01/2005:0435

SORBITOL

Sorbitolum

C₆H₁₄O₆

M_r 182.2

DEFINITION

Sorbitol contains not less than 97.0 per cent and not more than the equivalent of 102.0 per cent of D-glucitol (D-sorbitol), calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, very soluble in water, practically insoluble in alcohol.

It shows polymorphism.

IDENTIFICATION

First identification: A.

Second identification: B, C, D.

A. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (a).

B. Dissolve 0.5 g with heating in a mixture of 0.5 ml of *pyridine R* and 5 ml of *acetic anhydride R*. After 10 min, pour the solution into 25 ml of *water R* and allow to stand in iced water for 2 h. The precipitate, recrystallised from a small volume of *alcohol R* and dried *in vacuo*, melts (2.2.14) at 98 °C to 104 °C.

C. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel G plate R*.

Test solution. Dissolve 25 mg of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 25 mg of *sorbitol CRS* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 25 mg of *mannitol CRS* and 25 mg of *sorbitol CRS* in *water R* and dilute to 10 ml with the same solvent.

Apply to the plate 2 µl of each solution. Develop over a path of 17 cm using a mixture of 10 volumes of *water R*, 20 volumes of *ethyl acetate R* and 70 volumes of *propanol R*. Allow the plate to dry in air and spray with *4-aminobenzoic acid solution R*. Dry the plate in a current of cold air until the acetone is removed. Heat the plate at 100 °C for 15 min. Allow to cool and spray with a 2 g/l solution of *sodium periodate R*. Dry the plate in a current of cold air. Heat the plate at 100 °C for 15 min. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

D. Dissolve 5.00 g of the substance to be examined and 6.4 g of *disodium tetraborate R* in 40 ml of *water R*. Allow to stand for 1 h, shaking occasionally, and dilute to 50.0 ml with *water R*. Filter if necessary. The specific optical rotation (2.2.7) is + 4.0 to + 7.0, calculated with reference to the anhydrous substance.

TESTS

Appearance of solution. Dissolve 5 g in *water R* and dilute to 50 ml with the same solvent. The solution is clear (2.2.1) and colourless (2.2.2, Method II).

Conductivity (2.2.38). Not more than 20 µS cm⁻¹.

Dissolve 20.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100.0 ml with the same solvent. Measure the conductivity of the solution while gently stirring with a magnetic stirrer.

Reducing sugars. Dissolve 5.0 g in 6 ml of *water R* with the aid of gentle heat. Cool and add 20 ml of *cupri-citric solution R* and a few glass beads. Heat so that boiling begins after 4 min and maintain boiling for 3 min. Cool rapidly and add 100 ml of a 2.4 per cent V/V solution of *glacial acetic acid R* and 20.0 ml of 0.025 M *iodine*. With continuous shaking, add 25 ml of a mixture of 6 volumes of *hydrochloric acid R* and 94 volumes of *water R* and, when the precipitate has dissolved, titrate the excess of iodine with 0.05 M *sodium thiosulphate* using 1 ml of *starch solution R*, added towards the end of the titration, as indicator. Not less than 12.8 ml of 0.05 M *sodium thiosulphate* is required (0.2 per cent, calculated as glucose equivalent).

Related products. Examine by liquid chromatography (2.2.29) as described in the assay. Inject 20 µl of reference solution (b). Adjust the sensitivity of the system so that the height of the peak due to sorbitol is at least 50 per cent of the full scale of the recorder. Inject 20 µl of the test solution and 20 µl of reference solution (c) and continue the chromatography for twice the retention time of sorbitol. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (2 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3 per cent). Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent).

Lead (2.4.10). It complies with the limit test for lead in sugars (0.5 ppm).

Nickel (2.4.15). It complies with the limit test for nickel in polyols (1 ppm). Dissolve the substance to be examined in 150.0 ml of the prescribed mixture of solvents.

Water (2.5.12). Not more than 1.5 per cent, determined on 1.00 g by the semi-micro determination of water.

Microbial contamination. If intended for use in the manufacture of parenteral dosage forms the total viable aerobic count (2.6.12) is not more than 10² bacteria and 10² fungi per gram, determined by plate count. It complies with the tests for *Escherichia coli* and *Salmonella* (2.6.13).

Bacterial endotoxins (2.6.14): if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins, less than 4 IU/g for parenteral dosage forms having a concentration of less than 100 g/l of sorbitol, and less than 2.5 IU/g for parenteral dosage forms having a concentration of 100 g/l or more of sorbitol.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 5.0 g of the substance to be examined in 20 ml of *water R* and dilute to 100.0 ml with the same solvent.

Reference solution (a). Dissolve 0.50 g of *sorbitol CRS* in 2 ml of *water R* and dilute to 10.0 ml with the same solvent.

Reference solution (b). Dilute 2.0 ml of the test solution to 100.0 ml with *water R*.

Reference solution (c). Dilute 5.0 ml of reference solution (b) to 100.0 ml with *water R*.

Reference solution (d). Dissolve 0.5 g of *sorbitol R* and 0.5 g of *mannitol R* in 5 ml of *water R* and dilute to 10.0 ml with the same solvent.

The chromatography may be carried out using:

- a stainless steel column 0.3 m long and 7.8 mm in internal diameter packed with *strong cation exchange resin (calcium form) R* (9 µm) and maintained at a temperature of 85 ± 1 °C,
- as mobile phase at a flow rate of 0.5 ml/min, degassed *water R*,
- as detector, a refractometer maintained at a constant temperature.

Inject 20 µl of reference solution (d). Continue the chromatography for 3 times the retention time of sorbitol.

When the chromatograms are recorded in the prescribed conditions, the retention time of sorbitol is about 27 min and the relative retentions with reference to sorbitol are: maltitol

about 0.6, mannitol about 0.8 and iditol about 1.1. The test is not valid unless the resolution between the peaks due to sorbitol and to mannitol is at least 2 in the chromatogram obtained with reference solution (d).

Inject 20 µl of the test solution and 20 µl of reference solution (a). Continue the chromatography for twice the retention time of sorbitol.

Calculate the percentage content of D-sorbitol from the areas of the peaks and the declared content of *sorbitol CRS*.

LABELLING

The label states:

- where applicable, the maximum concentration of bacterial endotoxins,
- where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms.

IMPURITIES

A. mannitol,

B. iditol,

C. maltitol.

01/2005:0436
corrected

SORBITOL, LIQUID (CRYSTALLISING)

Sorbitolum liquidum cristallisabile

DEFINITION

Aqueous solution of a hydrogenated, partly hydrolysed starch.

Content:

- anhydrous substance: 68.0 per cent *m/m* to 72.0 per cent *m/m*,
- D-glucitol (D-sorbitol, C₆H₁₄O₆): 92.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: clear, colourless, syrupy liquid, miscible with water.

IDENTIFICATION

A. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

B. To 7.0 g add 40 ml of *water R* and 6.4 g of *disodium tetraborate R*, allow to stand for 1 h, shaking occasionally, and dilute to 50.0 ml with *water R*. Filter if necessary. The angle of rotation (2.2.7) is 0° to + 1.5°.

C. It is a clear, syrupy liquid at a temperature of 25 °C.

TESTS

Appearance of solution. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Dilute 7.0 g to 50 ml with *water R*.

Conductivity (2.2.38): maximum $10 \mu\text{S cm}^{-1}$ measured on the undiluted liquid sorbitol (crystallising) while gently stirring with a magnetic stirrer.

Reducing sugars: maximum 0.2 per cent calculated as glucose equivalent.

To 5.0 g add 6 ml of *water R*, 20 ml of *cupri-citric solution R* and a few glass beads. Heat so that boiling begins after 4 min and maintain boiling for 3 min. Cool rapidly and add 100 ml of a 2.4 per cent *V/V* solution of *glacial acetic acid R* and 20.0 ml of 0.025 *M* *iodine*. With continuous shaking, add 25 ml of a mixture of 6 volumes of *hydrochloric acid R* and 94 volumes of *water R* and, when the precipitate has dissolved, titrate the excess of iodine with 0.05 *M* *sodium thiosulphate* using 1 ml of *starch solution R*, added towards the end of the titration, as indicator. Not less than 12.8 ml of 0.05 *M* *sodium thiosulphate* is required.

Lead (2.4.10): maximum 0.5 ppm.

Nickel (2.4.15): maximum 1 ppm.

Water (2.5.12): 28.0 per cent to 32.0 per cent *m/m*, determined on 0.1 g.

ASSAY

Liquid chromatography (2.2.29).

Test solution. Mix 1.00 g of the substance to be examined with 20 ml of *water R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dissolve 65.0 mg of *sorbitol CRS* in 2 ml of *water R* and dilute to 5.0 ml with the same solvent.

Reference solution (b). Dissolve 65 mg of *mannitol R* and 65 mg of *sorbitol R* in 2 ml of *water R* and dilute to 5.0 ml with the same solvent.

Column:

- **size:** $l = 0.3 \text{ m}$, $\varnothing = 7.8 \text{ mm}$,
- **stationary phase:** strong cation exchange resin (calcium form) *R* (9 μm),
- **temperature:** $85 \pm 1^\circ\text{C}$.

Mobile phase: degassed *water R*.

Flow rate: 0.5 ml/min.

Detection: refractometer maintained at a constant temperature.

Injection: 20 μl .

Run time: 3 times the retention time of sorbitol.

Relative retention with reference to sorbitol (retention time = about 27 min): mannitol = about 0.8.

System suitability: reference solution (b):

- **resolution:** minimum 2 between the peaks due to mannitol and to sorbitol.

Calculate the percentage content of D-sorbitol from the areas of the peaks and the declared content of *sorbitol CRS*.

01/2005:0437
corrected

SORBITOL, LIQUID (NON-CRYSTALLISING)

Sorbitolum liquidum non cristallisabile

DEFINITION

Aqueous solution of a hydrogenated, partly hydrolysed starch.

Content:

- anhydrous substance: 68.0 per cent *m/m* to 72.0 per cent *m/m*,

- D-glucitol (D-sorbitol, $\text{C}_6\text{H}_{14}\text{O}_6$): 72.0 per cent to 92.0 per cent (anhydrous substance).

CHARACTERS

Appearance: clear, colourless, syrupy liquid, miscible with water.

IDENTIFICATION

A. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time to the principal peak in the chromatogram obtained with reference solution (a).

B. To 7.0 g add 40 ml of *water R* and 6.4 g of *disodium tetraborate R*. Allow to stand for 1 h, shaking occasionally, and dilute to 50.0 ml with *water R*. Filter if necessary. The angle of rotation (2.2.7) is $+1.5^\circ$ to $+3.5^\circ$.

C. It is a clear, syrupy liquid at 25°C .

TESTS

Appearance of solution. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Dilute 7.0 g to 50 ml with *water R*.

Conductivity (2.2.38): maximum $10 \mu\text{S cm}^{-1}$ measured on the undiluted liquid sorbitol (non crystallising) while gently stirring with a magnetic stirrer.

Reducing sugars: maximum 0.2 per cent calculated as glucose equivalent.

To 5.0 g add 6 ml of *water R*, 20 ml of *cupri-citric solution R* and a few glass beads. Heat so that boiling begins after 4 min and maintain boiling for 3 min. Cool rapidly and add 100 ml of a 2.4 per cent *V/V* solution of *glacial acetic acid R* and 20.0 ml of 0.025 *M* *iodine*. With continuous shaking, add 25 ml of a mixture of 6 volumes of *hydrochloric acid R* and 94 volumes of *water R* and, when the precipitate has dissolved, titrate the excess of iodine with 0.05 *M* *sodium thiosulphate* using 1 ml of *starch solution R*, added towards the end of the titration, as indicator. Not less than 12.8 ml of 0.05 *M* *sodium thiosulphate* is required.

Reducing sugars after hydrolysis: maximum 9.3 per cent calculated as glucose equivalent.

To 6.0 g add 35 ml of *water R*, 40 ml of 1 *M* *hydrochloric acid* and a few glass beads. Boil under a reflux condenser for 4 h. Cool and neutralise with *dilute sodium hydroxide solution R* using 0.2 ml of *bromothymol blue solution R1* as indicator. Cool and dilute to 100.0 ml with *water R*. To 3.0 ml of the solution add 5 ml of *water R*, 20 ml of *cupri-citric solution R* and a few glass beads. Heat so that boiling begins after 4 min and maintain boiling for 3 min. Cool rapidly and add 100 ml of a 2.4 per cent *V/V* solution of *glacial acetic acid R* and 20.0 ml of 0.025 *M* *iodine*. With continuous shaking, add 25 ml of a mixture of 6 volumes of *hydrochloric acid R* and 94 volumes of *water R*. When the precipitate has dissolved, titrate the excess of iodine with 0.05 *M* *sodium thiosulphate* using 1 ml of *starch solution R*, added towards the end of the titration, as indicator. Not less than 8.0 ml of 0.05 *M* *sodium thiosulphate* is required.

Lead (2.4.10): maximum 0.5 ppm.

Nickel (2.4.15): maximum 1 ppm.

Water (2.5.12): 28.0 per cent to 32.0 per cent *m/m*, determined on 0.1 g.

ASSAY

Liquid chromatography (2.2.29).

Test solution. Mix 1.00 g of the substance to be examined with 20 ml of *water R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dissolve 55.0 mg of *sorbitol CRS* in 2 ml of *water R* and dilute to 5.0 ml with the same solvent.

Reference solution (b). Dissolve 55 mg of *mannitol R* and 55 mg of *sorbitol R* in 2 ml of *water R* and dilute to 5.0 ml with the same solvent.

Column:

- size: $l = 0.3$ m, $\varnothing = 7.8$ mm,
- stationary phase: strong cation exchange resin (calcium form) *R* (9 μ m),
- temperature: 85 ± 1 °C.

Mobile phase: degassed *water R*.

Flow rate: 0.5 ml/min.

Detection: refractometer maintained at a constant temperature.

Injection: 20 μ l.

Run time: 3 times the retention time of sorbitol.

Relative retention with reference to sorbitol (retention time = about 27 min): mannitol = about 0.8.

System suitability: reference solution (b):

- resolution: minimum 2 between the peaks due to mannitol and to sorbitol.

Calculate the percentage content of D-sorbitol from the areas of the peaks and the declared content of *sorbitol CRS*.

01/2005:2048

SORBITOL, LIQUID, PARTIALLY DEHYDRATED

Sorbitolum liquidum partim deshydricum

DEFINITION

Liquid sorbitol, partially dehydrated is obtained by acid-catalysed partial internal dehydration of liquid sorbitol. It contains not less than 68.0 per cent *m/m* and not more than 85.0 per cent *m/m* of anhydrous substances, composed of a mixture of mainly D-sorbitol and 1,4-sorbitan with mannitol, hydrogenated oligo- and disaccharides, and sorbitans.

Content (nominal value):

- 1,4-sorbitan ($C_6H_{12}O_5$): minimum 15.0 per cent (anhydrous substance),
- D-sorbitol ($C_6H_{14}O_6$): minimum 25.0 per cent (anhydrous substance).

The contents of 1,4-sorbitan and D-sorbitol are within 95.0 per cent to 105.0 per cent of the nominal values.

CHARACTERS

Appearance: clear, colourless, syrupy liquid.

Solubility: miscible with water, practically insoluble in mineral oils and vegetable oils.

IDENTIFICATION

Examine the chromatograms obtained in the assay.

Results: the 2 principal peaks in the chromatogram obtained with the test solution are similar in retention time and size to the peaks in the chromatogram obtained with reference solution (a).

TESTS

Solution S. Dilute the substance to be examined with *carbon dioxide-free water R* prepared from *distilled water R* to obtain a solution containing 50.0 per cent *m/m* of anhydrous substance.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Conductivity (2.2.38): maximum 20 μ S $\cdot$ cm⁻¹.

Measure the conductivity of solution S, while gently stirring with a magnetic stirrer.

Reducing sugars: maximum 0.3 per cent, calculated as glucose (anhydrous substance).

To an amount of the substance to be examined equivalent to 3.3 g of anhydrous substance, add 3 ml of *water R*, 20.0 ml of *cupri-citric solution R* and a few glass beads. Heat so that boiling begins after 4 min. Maintain boiling for 3 min. Cool rapidly and add 100 ml of a 2.4 per cent *V/V* solution of *glacial acetic acid R* and 20.0 ml of 0.025 *M* iodine. With continuous shaking, add 25 ml of a mixture of 6 ml of *hydrochloric acid R* and 94 ml of *water R*. When the precipitate has dissolved, titrate the excess of iodine with 0.05 *M* sodium thiosulphate using 2 ml of *starch solution R*, added towards the end of the titration, as indicator. Not less than 12.8 ml of 0.05 *M* sodium thiosulphate is required.

Nickel (2.4.15): maximum 1 ppm (anhydrous substance).

Water (2.5.12): 15.0 per cent to 32.0 per cent, determined on 0.10 g.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10³ micro-organisms per gram and not more than 10² fungi per gram, determined by plate count. It complies with the tests for *Escherichia coli* and *Salmonella* (2.6.13).

ASSAY

Liquid chromatography (2.2.29).

Test solution. Dissolve 0.400 g of the substance to be examined in *water R* and dilute to 20.0 ml with the same solvent.

Reference solution (a). Dissolve 50.0 mg of *sorbitol CRS* and 20.0 mg of 1,4-sorbitan *CRS* in *water R* and dilute to 5.0 ml with the same solvent.

Reference solution (b). Dissolve 0.100 g of *mannitol R* and 0.100 g of *sorbitol R* in *water R* and dilute to 10.0 ml with the same solvent.

Column:

- size: $l = 0.3$ m, $\varnothing = 7.8$ mm,
- stationary phase: strong cation exchange resin (calcium form) *R* (9 μ m),
- temperature: 80 ± 5 °C.

Mobile phase: degassed *water R*.

Flow rate: 0.5 ml/min.

Detection: refractometer maintained at a constant temperature of about 30-35 °C.

Injection: 40 μ l.

Relative retention with reference to D-sorbitol (retention time = about 25 min): 1,4-sorbitan = about 0.5; mannitol = about 0.8.

System suitability: reference solution (b):

- resolution: minimum 2.0 between the peaks due to mannitol and D-sorbitol.

Calculate the percentage contents of 1,4-sorbitan and D-sorbitol using the chromatogram obtained with reference solution (a) and the declared contents of 1,4-sorbitan CRS and of sorbitol CRS.

LABELLING

The label states the content of D-sorbitol and the content of 1,4-sorbitan (= nominal values).

01/2005:2004

SOTALOL HYDROCHLORIDE

Sotaloli hydrochloridum

$C_{12}H_{21}ClN_2O_3S$

M_r 308.8

DEFINITION

N-[4-[(1*S*)-1-hydroxy-2-[(1-methylethyl)amino]ethyl]phenyl]methanesulphonamide hydrochloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: freely soluble in water, soluble in alcohol, practically insoluble in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: sotalol hydrochloride CRS.

B. It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 5.0 g in carbon dioxide-free water *R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension III (2.2.1) and not more intensely coloured than reference solution Y_6 (2.2.2, *Method II*).

pH (2.2.3): 4.0 to 5.0.

Dilute 5.0 ml of solution S to 10.0 ml with carbon dioxide-free water *R*.

Optical rotation (2.2.7): -0.10° to $+0.10^\circ$.

Dilute 25.0 ml of solution S to 50.0 ml with water *R*.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 3.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 8.0 mg of sotalol impurity B CRS in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 100.0 ml with the mobile phase.

Reference solution (d). Dilute 1.5 ml of reference solution (b) to 100 ml with the mobile phase. To 1 ml of this solution add 1 ml of reference solution (a).

Column:

– *size*: $l = 0.25$ m, $\varnothing = 4.6$ mm,

– *stationary phase*: octadecylsilyl silica gel for chromatography *R* (5 μ m).

Mobile phase: dissolve 2 g of sodium octanesulphonate *R* in 790 ml of water *R*. Adjust to pH 3.0 with phosphoric acid *R* and add 210 ml of acetonitrile *R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 228 nm.

Injection: 10 μ l; inject the test solution and reference solutions (a), (c) and (d).

Run time: 2.5 times the retention time of sotalol.

System suitability: reference solution (d):

– *resolution*: minimum 4.0 between the peaks due to sotalol and to impurity B.

Limits:

– *impurity B*: not more than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent),

– *any other impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent), and not more than 1 such peak has an area greater than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),

– *total of other impurities*: not more than 1.65 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),

– *disregard limit*: 0.17 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Palladium: maximum 0.5 ppm.

Atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dissolve 1.00 g in a mixture of 0.25 volumes of nitric acid *R*, 0.75 volumes of hydrochloric acid *R* and 99.0 volumes of water *R* and dilute to 20.0 ml with the same mixture of solvents.

Reference solutions. Use solutions containing 0.02 μ g, 0.03 μ g and 0.05 μ g of palladium per millilitre, freshly prepared by dilution of palladium standard solution (0.5 ppm Pd) *R* with a mixture of 0.25 volumes of nitric acid *R*, 0.75 volumes of hydrochloric acid *R* and 99.0 volumes of water *R*.

Source: palladium hollow-cathode lamp.

Wavelength: 247.6 nm.

Use a graphite tube.

Heavy metals (2.4.8): maximum 20 ppm.

To 10 ml of solution S add 10 ml of water *R*. 12 ml of the solution complies with limit test A. Prepare the standard using lead standard solution (1 ppm Pb) *R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 $^\circ$ C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

In order to avoid overheating during the titration, mix thoroughly throughout and stop the titration immediately after the end-point has been reached.

Dissolve 0.250 g in 10 ml of anhydrous formic acid *R*, if necessary with the aid of ultrasound. Add 40 ml of acetic anhydride *R* and titrate immediately with 0.1 M perchloric acid. Determine the end-point potentiometrically (2.2.20).

1 ml of 0.1 M perchloric acid is equivalent to 30.88 mg of $C_{12}H_{21}ClN_2O_3S$.

STORAGE

Protected from light.

IMPURITIES

A. R = $CH_2CH_2NHCH(CH_3)_2$: N-[4-[2-[(1-methylethyl)amino]ethyl]phenyl]methanesulphonamide,

B. R = $COCH_2NHCH(CH_3)_2$: N-[4-[(1-methylethyl)amino]acetyl]phenyl]methanesulphonamide,

C. R = CHO: N-(4-formylphenyl)methanesulphonamide,

D. N-[4-[(1RS)-2-hydroxy-1-[(1-methylethyl)amino]ethyl]phenyl]methanesulphonamide.

01/2005:1265

SOYA-BEAN OIL, HYDROGENATED

Soiae oleum hydrogenatum

DEFINITION

Hydrogenated soya-bean oil is the product obtained by refining, bleaching, hydrogenation and deodorisation of oil obtained from seeds of *Glycine soja* Sieb. and Zucc. and *Glycine max* (L.) Merr. (*G. hispida* (Moench) Maxim.). The product consists mainly of triglycerides of palmitic and stearic acids.

CHARACTERS

A white mass or powder which melts to a clear, pale yellow liquid when heated, practically insoluble in water, freely soluble in methylene chloride, in light petroleum (bp: 65 °C to 70 °C) after heating and in toluene, very slightly soluble in alcohol.

IDENTIFICATION

- It complies with the test for melting point (see Tests).
- It complies with the test for foreign fatty oils (see Tests).

TESTS

Melting point (2.2.15): 66 °C to 72 °C.

Acid value (2.5.1). Not more than 0.5, determined on 10.0 g. Dissolve the substance to be examined in 50 ml of a hot mixture of equal volumes of *alcohol R* and *toluene R*, previously neutralised with 0.1 M potassium hydroxide using 0.5 ml of *phenolphthalein solution R1* as indicator. Titrate the solution immediately while still hot.

Peroxide value (2.5.5). Not more than 5.0.

Unsaponifiable matter (2.5.7). Not more than 1.0 per cent, determined on 5.0 g.

Alkaline impurities in fatty oils (2.4.19). Dissolve 2.0 g with gentle heating in a mixture of 1.5 ml of *alcohol R* and 3 ml of *toluene R*. Add 0.05 ml of a 0.4 g/l solution of *bromophenol blue R* in *alcohol R*. Not more than 0.4 ml of 0.01 M *hydrochloric acid* is required to change the colour to yellow.

Composition of fatty acids (2.4.22, Method A).

The chromatographic procedure may be carried out using:

- a fused-silica column 25 m long and 0.25 mm in internal diameter coated with *poly(cyanopropyl)siloxane R* (film thickness 0.2 µm),
- helium for chromatography R* as the carrier gas at a flow rate of 0.65 ml/min,
- a flame-ionisation detector,
- a split injector (1:100),

maintaining the temperature of the column at 180 °C for 20 min and that of the injection port and the detector at 250 °C.

The fatty acid fraction of the oil has the following composition:

- saturated fatty acids of chain length less than C_{14} : not more than 0.1 per cent,
- myristic acid: not more than 0.5 per cent,
- palmitic acid: 9.0 per cent to 16.0 per cent,
- stearic acid: 79.0 per cent to 89.0 per cent,
- oleic acid and isomers ($C_{18:1}$ equivalent chain length on *poly(cyanopropyl)siloxane* 18.5 to 18.8): not more than 4.0 per cent,
- linoleic acid and isomers ($C_{18:2}$ equivalent chain length on *poly(cyanopropyl)siloxane* 19.4 to 19.8): not more than 1.0 per cent,
- linolenic acid and isomers ($C_{18:3}$ equivalent chain length on *poly(cyanopropyl)siloxane* 20.3 to 20.7): not more than 0.2 per cent,
- arachidic acid: not more than 1.0 per cent,
- behenic acid: not more than 1.0 per cent.

Nickel. Not more than 1 ppm of Ni, determined by atomic absorption spectrometry (2.2.23, Method II).

Test solution. Introduce 5.0 g into a platinum or silica crucible, previously tared after calcination. Cautiously heat and introduce into the substance a wick formed from twisted ashless filter paper. Light the wick. When the substance is alight stop heating. After combustion, ignite in a muffle furnace at about 600 °C. Continue the ignition until white ash is obtained. After cooling, take up the residue with two quantities, each of 2 ml, of *dilute hydrochloric acid R* and transfer into a 25 ml graduated flask. Add 0.3 ml of *nitric acid R* and dilute to 25.0 ml with *water R*.

Reference solutions. Prepare three reference solutions by adding 1.0 ml, 2.0 ml and 4.0 ml of *nickel standard solution* (0.2 ppm Ni) *R* to 2.0 ml of the test solution and diluting to 10.0 ml with *water R*.

Measure the absorbance at 232 nm using a nickel hollow-cathode lamp as a source of radiation, a graphite furnace as an atomic generator and *argon R* as the carrier gas.

Water (2.5.12). Not more than 0.3 per cent, determined on 1.000 g by the semi-micro determination of water.

STORAGE

Store protected from light.

01/2005:1473 STORAGE

SOYA-BEAN OIL, REFINED**Soiae oleum raffinatum****DEFINITION**

Refined soya-bean oil is the fatty oil obtained from seeds of *Glycine soja* Sieb. and Zucc. and *Glycine max* (L.) Merr. (*G. hispida* (Moench) Maxim.) by extraction and subsequent refining. It may contain a suitable antioxidant.

CHARACTERS

A clear, pale yellow, liquid, miscible with light petroleum (50 °C to 70 °C), practically insoluble in alcohol.

It has a relative density of about 0.922 and a refractive index of about 1.475.

IDENTIFICATION

Carry out the identification of fatty oils by thin-layer chromatography (2.3.2). The chromatogram obtained is similar to the typical chromatogram for soya-bean oil.

TESTS

Acid value (2.5.1). Not more than 0.5, determined on 10.0 g.

Peroxide value (2.5.5, Method A). Not more than 10.0. If intended for use in the manufacture of parenteral dosage forms, the peroxide value is not more than 5.0.

Unsaponifiable matter (2.5.7). Not more than 1.5 per cent, determined on 5.0 g.

Alkaline impurities (2.4.19). It complies with the test for alkaline impurities in fatty oils.

Composition of fatty acids (2.4.22, Method A). The fatty acid fraction of the oil has the following composition:

- *saturated fatty acids of chain length less than C₁₄*: not more than 0.1 per cent,
- *myristic acid*: not more than 0.2 per cent,
- *palmitic acid*: 9.0 per cent to 13.0 per cent,
- *palmitoleic acid* (equivalent chain length on polyethyleneglycol adipate 16.3): not more than 0.3 per cent,
- *stearic acid*: 3.0 per cent to 5.0 per cent,
- *oleic acid* (equivalent chain length on polyethyleneglycol adipate 18.3): 17.0 per cent to 30.0 per cent,
- *linoleic acid* (equivalent chain length on polyethyleneglycol adipate 18.9): 48.0 per cent to 58.0 per cent,
- *linolenic acid* (equivalent chain length on polyethyleneglycol adipate 19.7): 5.0 per cent to 11.0 per cent,
- *arachidic acid*: not more than 1.0 per cent,
- *eicosenoic acid* (equivalent chain length on polyethyleneglycol adipate 20.3): not more than 1.0 per cent,
- *behenic acid*: not more than 1.0 per cent.

Brassicasterol (2.4.23). The sterol fraction of the oil contains not more than 0.3 per cent of brassicasterol.

Water (2.5.32). If intended for use in the manufacture of parenteral dosage forms, not more than 0.1 per cent, determined on 5.00 g by the coulometric determination of water. Use a mixture of equal volumes of *decanol R* and *anhydrous methanol R* as the solvent.

STORAGE

Store in a well-filled container, protected from light, at a temperature not exceeding 25 °C.

LABELLING

The label states:

- where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms,
- the name and concentration of any added antioxidant.

01/2005:1152

SPECTINOMYCIN HYDROCHLORIDE**Spectinomycini hydrochloridum**C₁₄H₂₆Cl₂N₂O₇·5H₂OM_r 495.4**DEFINITION**

Spectinomycin hydrochloride is the pentahydrate of the dihydrochloride of (2*R*,4*aR*,5*aR*,6*S*,7*S*,8*R*,9*S*,9*aR*,10*aS*)-4*a*,7,9-trihydroxy-2-methyl-6,8-bis(methylamino)decahydro-4*H*-pyrano[2,3-*b*][1,4]benzodioxin-4-one dihydrochloride, an antimicrobial substance produced by *Streptomyces spectabilis* or by any other means. It contains not less than 95.0 per cent and not more than the equivalent of 100.5 per cent of C₁₄H₂₆Cl₂N₂O₇ calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white powder, slightly hygroscopic, freely soluble in water, very slightly soluble in alcohol.

IDENTIFICATION

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *spectinomycin hydrochloride CRS*.
- B. Dilute 1.0 ml of solution S (see Tests) to 10 ml with *water R*. The solution gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 2.0 g in *carbon dioxide-free water R* and dilute to 20.0 ml with the same solvent.

Appearance of solution. Dilute 2.0 ml of solution S to 20.0 ml with *water R*. The solution is clear (2.2.1) and colourless (2.2.2, Method II).

pH (2.2.3). The pH of solution S is 3.8 to 5.6.

Specific optical rotation (2.2.7): + 15 to + 21, determined on solution S within 20 min of preparation and calculated with reference to the anhydrous substance.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. Dilute 2.0 ml of solution S to 10 ml with *water R*.

Reference solution. Dilute 1.0 ml of the test solution to 100 ml with *water R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 12 cm using a mixture of 5 volumes of *glacial acetic acid R*, 5 volumes of *pyridine R*, 40 volumes of *water R* and 50 volumes of *propanol R*. Dry the plate in a current of warm air and spray with a 50 g/l solution of *potassium permanganate R*. Allow the plate to stand for 2 min to 3 min. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (1.0 per cent).

Water (2.5.12): 16.0 per cent to 20.0 per cent, determined on 0.200 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 1.0 per cent, determined on 1.000 g.

Bacterial endotoxins (2.6.14): less than 0.09 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins. Prepare the solutions using a 0.42 per cent *m/m* solution of *sodium hydrogen carbonate R*.

ASSAY

Examine by gas chromatography (2.2.28), using *phenazone R* as the internal standard.

Internal standard solution. Dissolve 0.150 g of *phenazone R* in *dimethylformamide R* and dilute to 100 ml with the same solvent.

Allow the test solutions and the reference solution to stand for 1 h. Carry out the assay immediately.

Test solution (a). To 60.0 mg of the substance to be examined in a volumetric flask, add 10 ml of *dimethylformamide R* and 2.0 ml of *hexamethyldisilazane R*. Shake to dissolve and dilute to 20.0 ml with *dimethylformamide R*.

Test solution (b). To 60.0 mg of the substance to be examined in a volumetric flask add 10.0 ml of the internal standard solution and 2.0 ml of *hexamethyldisilazane R*. Shake to dissolve and dilute to 20.0 ml with *dimethylformamide R*.

Reference solution. To 60.0 mg of *spectinomycin hydrochloride CRS* in a volumetric flask add 10.0 ml of the internal standard solution and 2.0 ml of *hexamethyldisilazane R*. Shake to dissolve and dilute to 20.0 ml with *dimethylformamide R*.

The chromatographic procedure may be carried out using:

- a glass column 1.5 m long and 4 mm in internal diameter packed with *silanised diatomaceous earth for gas chromatography R* (125 µm to 150 µm) impregnated with 3 per cent *m/m* of a mixture of *polyphenylmethylsiloxane R*,
- *nitrogen for chromatography R* as the carrier gas at a flow rate of 45 ml/min,
- a flame-ionisation detector,
- an electronic integrator.

Maintain the temperature of the column at 200 °C and that of the injection port and of the detector between 200 °C and 230 °C. Inject the chosen volumes of the test solutions. The assay is not valid unless in the chromatogram obtained with test solution (b) the resolution between the main peak and the peak corresponding to the internal standard is at least 8.0. Inject alternately test solution (b) and the reference solution.

Calculate the percentage content of spectinomycin.

STORAGE

Store in an airtight container, at a temperature not exceeding 30 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

- A. 1,3-dideoxy-1,3-bis(methylamino)-*myo*-inositol (actinamine),

- B. (2*S*,3*RS*,5*R*)-3-hydroxy-5-methyl-2-[[[(1*r*,2*R*,3*S*,4*r*,5*R*,6*S*)-2,4,6-trihydroxy-3,5-bis(methylamino)cyclohexyl]oxy]tetrahydrofuran-3-carboxylic acid (actinospectinoic acid),

- C. (2*R*,4*RS*,4*aS*,5*aR*,6*S*,7*S*,8*R*,9*S*,9*aR*,10*aS*)-2-methyl-6,8-bis(methylamino)decahydro-2*H*-pyrano[2,3-*b*][1,4]benzodioxine-4,4*a*,7,9-tetrol (dihydrospectinomycins),

- D. (2*R*,3*R*,4*S*,4*aS*,5*aR*,6*S*,7*S*,8*R*,9*S*,9*aR*,10*aS*)-2-methyl-6,8-bis(methylamino)decahydro-2*H*-pyrano[2,3-*b*][1,4]benzodioxine-3,4,4*a*,7,9-pentol (dihydroxyspectinomycin).

SPIRAMYCIN

Spiramycinum

Spiramycin I	R = H	C ₄₃ H ₇₄ N ₂ O ₁₄
Spiramycin II	R = CO-CH ₃	C ₄₅ H ₇₆ N ₂ O ₁₅
Spiramycin III	R = CO-CH ₂ -CH ₃	C ₄₆ H ₇₈ N ₂ O ₁₅

C₄₃H₇₄N₂O₁₄

DEFINITION

Spiramycin is a macrolide antibiotic produced by the growth of certain strains of *Streptomyces ambofaciens* or obtained by any other means. The main component is (4*R*,5*S*,6*S*,7*R*,9*R*,10*R*,11*E*,13*E*,16*R*)-6-[[3,6-dideoxy-4-*O*-(2,6-dideoxy-3-*C*-methyl-α-*L*-ribohexopyranosyl)-3-(dimethylamino)-β-*D*-glucopyranosyl]oxy]-4-hydroxy-5-methoxy-9,16-dimethyl-7-(2-oxoethyl)-10-[[2,3,4,6-tetra-deoxy-4-(dimethylamino)-*D*-erythrohexopyranosyl]oxy]oxacyclohexadeca-11,13-dien-2-one (spiramycin I, *M_r* 843). Spiramycin II (4-*O*-acetylsiramycin I) and spiramycin III (4-*O*-propanoylsiramycin I) are also present. The potency is at least 4100 IU/mg, calculated with reference to the dried substance.

CHARACTERS

A white or slightly yellowish powder, slightly hygroscopic, slightly soluble in water, freely soluble in acetone, in alcohol and in methanol.

IDENTIFICATION

- A. Dissolve 0.10 g in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 100.0 ml with *methanol R*. Examined between 220 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 232 nm. The specific absorbance at the maximum is about 340.
- B. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel G plate R*.
- Test solution.* Dissolve 40 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.
- Reference solution (a).* Dissolve 40 mg of *spiramycin CRS* in *methanol R* and dilute to 10 ml with the same solvent.
- Reference solution (b).* Dissolve 40 mg of *erythromycin A CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using the upper layer of a mixture of 4 volumes of *2-propanol R*, 8 volumes of a 150 g/l solution of *ammonium acetate R* previously adjusted to pH 9.6 with *strong sodium hydroxide solution R*, and 9 volumes of *ethyl acetate R*. Allow the plate to dry in air, spray with *anisaldehyde solution R1* and heat at 110 °C for 5 min. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). If in the chromatogram obtained with the test solution one or two spots occur with *R_f* values slightly higher than that of the principal spot, these spots are similar in position and colour to the secondary spots in the chromatogram obtained with reference solution (a) and differ from the spots in the chromatogram obtained with reference solution (b).

- C. Dissolve 0.5 g in 10 ml of 0.05 *M* sulphuric acid and add 25 ml of *water R*. Adjust to about pH 8 with 0.1 *M* sodium hydroxide and dilute to 50 ml with *water R*. To 5 ml of this solution add 2 ml of a mixture of 1 volume of *water R* and 2 volumes of sulphuric acid *R*. A brown colour develops.

TESTS

pH (2.2.3). Dissolve 0.5 g in 5 ml of *methanol R* and dilute to 100 ml with *carbon dioxide-free water R*. The pH of the solution is 8.5 to 10.5.

Specific optical rotation (2.2.7). Dissolve 1.00 g in a 10 per cent *V/V* solution of *dilute acetic acid R* and dilute to 50.0 ml with the same acid. The specific optical rotation is –80 to –85, calculated with reference to the dried substance.

Composition. Not less than 80.0 per cent of spiramycin I, not more than 5.0 per cent of spiramycin II and not more than 10.0 per cent of spiramycin III; the sum of the contents of spiramycin I, spiramycin II and spiramycin III is not less than 90.0 per cent, all contents are calculated with reference to the dried substance. Examine by liquid chromatography (2.2.29) as prescribed in the test for related substances.

Inject reference solution (a) 6 times. The test is not valid unless the relative standard deviation of the peak area for spiramycin I is at most 1.0 per cent. Inject alternately the test solution and reference solution (a). Continue the chromatography of the test solution for 3 times the retention time of spiramycin I. Calculate the percentage content of spiramycin I, spiramycin II and spiramycin III using the declared contents of *spiramycin CRS*.

Related substances. Examine by liquid chromatography (2.2.29). Prepare the solutions immediately before use.

Test solution. Dissolve 25.0 mg of the substance to be examined in a mixture of 3 volumes of *acetonitrile R* and 7 volumes of *water R* and dilute to 100.0 ml with the same mixture of solvents.

Reference solution (a). Dissolve 25.0 mg of *spiramycin CRS* in a mixture of 3 volumes of *acetonitrile R* and 7 volumes of *water R* and dilute to 100.0 ml with the same mixture of solvents.

Reference solution (b). Dilute 2.0 ml of reference solution (a) to 100.0 ml with a mixture of 3 volumes of *acetonitrile R* and 7 volumes of *water R*.

Reference solution (c). Dilute 5.0 ml of reference solution (a) to 100.0 ml with a mixture of 3 volumes of *acetonitrile R* and 7 volumes of *water R*.

Reference solution (d). Dissolve 5 mg of *spiramycin CRS* in 25 ml of the mobile phase, then heat in a water-bath at 60 °C for 30 min.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with spherical *octylsilyl silica gel for chromatography R* (5 µm) with a specific surface area of 350 m²/g and a pore size of 10 nm,
- as mobile phase at a flow rate of 0.8 ml/min a mixture of 30 volumes of *acetonitrile R* and 70 volumes of *buffer solution pH 2.2 R* containing 9.3 g/l of *sodium perchlorate R*,
- as detector a spectrophotometer set at 232 nm.

Inject 20 µl of reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained is at least 50 per cent of the full scale of the recorder. Inject 20 µl of reference solution (c) and 20 µl of reference solution (d). The test is not valid unless: in the chromatogram obtained with reference solution (c), there is no significant peak with a retention time, relative to spiramycin I, of about 1.1; in the chromatogram obtained with reference solution (d), the resolution between impurity A (eluting first) and spiramycin I (eluting at 13 min to 17 min) is at least 6.3 (see Figure 0293.-1). If necessary, adjust the concentration of acetonitrile in the mobile phase (increasing the concentration to decrease the retention time or decreasing the concentration to increase the retention time).

Inject 20 µl of the test solution and 20 µl of reference solution (b). Continue the chromatography of the test solution for 3 times the retention time of spiramycin I. In the chromatogram obtained with the test solution: the area of any peak, apart from the peaks corresponding to spiramycin I, spiramycin II and spiramycin III, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (2 per cent). Disregard any peak with an area less than 0.05 times that of the principal peak in the chromatogram obtained with reference solution (b).

Heavy metals (2.4.8). 1.0 g complies with limit test C (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 3.5 per cent, determined on 0.50 g by drying over *diphosphorus pentoxide R* at 80 °C at a pressure not exceeding 670 Pa for 6 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Carry out the microbiological assay of antibiotics (2.7.2).

STORAGE

Store in an airtight container.

Figure 0293.-1.— Chromatogram for the test for related substances of spiramycin

IMPURITIES

01/2005:1766

- A. $R_1 = H$, $R_2 = OH$, $R_3 = CH_2-CHO$, $R_4 = N(CH_3)_2$: (4*R*,5*S*,6*S*,7*R*,9*R*,10*R*,11*E*,13*E*,16*R*)-6-[[[3,6-dideoxy-3-(dimethylamino)-β-D-glucopyranosyl]oxy]-4-hydroxy-5-methoxy-9,16-dimethyl-7-(2-oxoethyl)-10-[[2,3,4,6-tetra-deoxy-4-(dimethylamino)-D-erythro-hexopyranosyl]oxy]oxacyclohexadeca-11,13-dien-2-one (neospiramycin I),
- B. $R_1 = H$, $R_2 = osyl$, $R_3 = CH_2-CH_2OH$, $R_4 = N(CH_3)_2$: (4*R*,5*S*,6*S*,7*R*,9*R*,10*R*,11*E*,13*E*,16*R*)-6-[[[3,6-dideoxy-4-O-(2,6-dideoxy-3-C-methyl-α-L-ribo-hexopyranosyl)-3-(dimethylamino)-β-D-glucopyranosyl]oxy]-4-hydroxy-7-(2-hydroxyethyl)-5-methoxy-9,16-dimethyl-10-[[2,3,4,6-tetra-deoxy-4-(dimethylamino)-D-erythro-hexopyranosyl]oxy]oxacyclohexadeca-11,13-dien-2-one,
